

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE

PRACTICE OF PHARMACY.

A TREATISE

ON THE MODES OF MAKING AND DISPENSING OFFICIAL,
UNOFFICIAL, AND EXTEMPORANEOUS PREPARA-
TIONS, WITH DESCRIPTIONS OF THEIR
PROPERTIES, USES, AND DOSES.

INTENDED AS A

HAND-BOOK FOR PHARMACISTS AND PHYSICIANS

AND A

TEXT-BOOK FOR STUDENTS.

THIRD EDITION.

ENLARGED AND THOROUGHLY REVISED.

BY

JOSEPH P. REMINGTON, PH.M., F.C.S.,

PROFESSOR OF THEORY AND PRACTICE OF PHARMACY, AND DIRECTOR OF THE PHARMACEUTICAL LABORATORY,
IN THE PHILADELPHIA COLLEGE OF PHARMACY; FIRST VICE-CHAIRMAN OF THE COMMITTEE OF
REVISION AND PUBLICATION OF THE PHARMACOPOEIA OF THE UNITED STATES OF
AMERICA; PHARMACEUTICAL EDITOR OF THE UNITED STATES DISPEN-
SATORY; HONORARY MEMBER OF THE PHARMACEUTICAL
SOCIETY OF GREAT BRITAIN, ETC., ETC.

WITH OVER SIX HUNDRED ILLUSTRATIONS.

PHILADELPHIA:

J. B. LIPPINCOTT COMPANY.

LONDON: 10 HENRIETTA STREET, COVENT GARDEN.

1894.

LIBRARY OF MEDICINE

ELECTROTYPED AND PRINTED BY J. B. LIPPINCOTT COMPANY, PHILADELPHIA, PA., U. S. A.

PREFACE TO THE THIRD EDITION.

THE publication of the United States Pharmacopœia (seventh decennial revision) in 1893 furnishes the *raison d'être* for a new edition of the "Practice of Pharmacy," the sweeping changes which have been made in the Pharmacopœia, and notably the acceptance of the Metric system of weights and measures, having caused a revolution in pharmaceutical practice.

The addition of many new remedies and the alterations in chemical and botanical nomenclature in the Pharmacopœia have added greatly to the labor of preparing the manuscript of the present work ; and, since it aims to present those facts which shall be of the greatest usefulness to the pharmacist and student in such a manner as to command attention, without being so brief as to fail in its mission, an increase in the size of the book was inevitable.

The features in the former edition which seemed to give greatest satisfaction to its readers have been retained ; and among the new ones may be mentioned the "Glossary" at the end of the formulary, containing short definitions of uncommon terms which the pharmacist is liable to be suddenly called upon to interpret.

The working formulas are constructed with especial regard to the avoidance of errors in their use, the proportions of the various ingredients being arranged to suit the needs of every-day workers who use the "Practice of Pharmacy" as a hand-book.

The index, which has been amplified, has been prepared by Alfred B. Taylor, A.M., a comprehensive table of metric and old form

equivalents has been added, and the feature of indicating working formulas by heavy-faced type has been retained.

In conclusion, the author desires to express his thanks to his many professional friends for the words of encouragement with which they have favored him ; while to the pharmaceutical students, who mainly use the work as their guide, he trusts that the third edition will prove as welcome as its predecessor, and be a valuable aid in leading them to success and prosperity.

J. P. R.

PHILADELPHIA, August, 1894.

PREFACE TO THE FIRST EDITION.

THE rapid and substantial progress made in Pharmacy within the last decade has created a necessity for a work treating of the improved apparatus, the revised processes, and the recently introduced preparations of the age.

The vast advances made in theoretical and applied chemistry and physics have had much to do with the development of pharmaceutical science, and these have been reflected in all the revised editions of the Pharmacopœias which have been recently published. When the author was elected in 1874 to the chair of Theory and Practice of Pharmacy in the Philadelphia College of Pharmacy, the outlines of study which had been so carefully prepared for the classes by his eminent predecessors, Professor William Procter, Jr., and Professor Edward Parrish, were found to be not strictly in accord, either in their arrangement of the subjects or in their method of treatment. Desiring to preserve the distinctive characteristics of each, an effort was at once made to frame a system which should embody their valuable features, embrace new subjects, and still retain that harmony of plan and proper sequence which are absolutely essential to the success of any system.

The strictly alphabetical classification of subjects which is now universally adopted by Pharmacopœias and Dispensatories, although admirable in works of reference, presents an effectual stumbling-block to the acquisition of pharmaceutical knowledge through systematic study: the vast accumulation of facts collected under each head being arranged lexically, they necessarily have no connection with one another, and thus the saving of labor effected by considering similar groups together, and the value of the association of kindred subjects, are lost to the student. In the method of grouping the subjects which is herein adopted, the constant aim has been to arrange the latter in such a manner that the reader shall be gradually led from the consideration of elementary subjects to those which involve more advanced knowledge, whilst the groups themselves are so placed as to follow one another in a natural sequence.

The work is divided into six parts. Part I. is devoted to detailed descriptions of apparatus and definitions and comments on general pharmaceutical processes.

The Official Preparations alone are considered in Part II. Due weight and prominence are thus given to the Pharmacopœia, the National authority, which is now so thoroughly recognized.

In order to suit the convenience of pharmacists who prefer to *weigh solids* and *measure liquids*, the official formulas are expressed, in addition to parts by weight, in *avoirdupois weight* and *apothecaries' measure*. These equivalents are printed in *bold type*, near the margin, and arranged so as to fit them for quick and accurate reference.

Part III. treats of Inorganic Chemical Substances. Precedence is of course given to official preparations in these. The descriptions, solubilities, and tests for identity and impurities of each substance are systematically tabulated under its proper title. It is confidently believed that by this method of arrangement the valuable descriptive features of the Pharmacopœia will be more prominently developed, ready reference facilitated, and close study of the details rendered easy. Each chemical operation is accompanied by equations, whilst the reaction is, in addition, explained in words.

The Carbon Compounds, or Organic Chemical Substances, are considered in Part IV. These are naturally grouped according to the physical and medical properties of their principal constituents, beginning with simple bodies like cellulul, gum, etc., and progressing to the most highly organized alkaloids, etc.

Part V. is devoted to Extemporaneous Pharmacy. Care has been taken to treat of the practice which would be best adapted for the needs of the many pharmacists who conduct operations upon a moderate scale, rather than for those of the few who manage very large establishments. In this, as well as in other parts of the work, operations are illustrated which are conducted by manufacturing pharmacists.

Part VI. contains a Formulary of Pharmaceutical Preparations which have not been recognized by the Pharmacopœia. The recipes selected are chiefly those which have been heretofore rather difficult of access to most pharmacists, yet such as are likely to be in request. Many private formulas are embraced in the collection; and such of the preparations of the old Pharmacopœias as have not been included in the new edition, but are still in use, have been inserted.

In conclusion, the author ventures to express the hope that the work will prove an efficient help to the pharmaceutical student as well as to the pharmacist and the physician. Although the labor has been mainly performed amidst the harassing cares of active professional duties, and perfection is known to be unattainable, no pains has been spared to discover and correct errors and omissions in the text. The author's warmest acknowledgments are tendered to Mr. A. B. Taylor, Mr. Joseph McCreery, and Mr. George M. Smith for their valuable assistance in revising the proof-sheets, and to the latter especially for his work on the index. The outline illustrations, by Mr. John Collins, were drawn either from the actual objects or from photographs taken by the author.

PHILADELPHIA, October, 1885.

PRACTICE OF PHARMACY.

INTRODUCTORY.

THEORETICAL AND PRACTICAL PHARMACY.

Pharmacy is the science which treats of medicinal substances. It comprehends not only a knowledge of medicines and the arts of preparing and dispensing them, but also their identification, selection, preservation, combination, and analysis.

The word Pharmacy is also used to designate the place where medicines are sold.

For convenience in study, Pharmacy may be divided into two great classes,—viz., *Theoretical Pharmacy* and *Practical Pharmacy*.

Theoretical Pharmacy.—Inasmuch as all Nature, animate and inanimate, has been laid under contribution to provide remedies for the alleviation of disease, it follows that those sciences which embrace a knowledge of substances obtained from the vegetable, mineral, and animal kingdoms, as well as those which treat of the laws governing them, are called upon to furnish important facts which form the basis of the science of Pharmacy.

Botany, the science of plants, *Mineralogy*, that of inorganic substances found in or on the earth, and *Zoology*, the science which treats of animals, are, however, less important than *Chemistry* and *Physics*; for upon these two Pharmacy is most dependent for its greatest development and its highest degree of usefulness.

Physics or *Natural Philosophy* is that branch of science which describes and explains the changes produced in bodies, by which their specific identity is not destroyed, whilst *Chemistry* treats of those changes which affect the specific identity of the bodies.

Materia Medica (medicinal materials) is a term applied to designate the substances which are used in the cure of diseases; it is most intimately connected with *Pharmacognosy*, the science which treats of crude drugs, whilst the specific definition of Pharmacy limits the latter to the consideration of the preparations made from drugs.

In Colleges of Pharmacy, as well as in Universities where pharmacy is a part of the instruction, it is usual to divide General Pharmacy into three departments,—Chemistry, Botany and *Materia Medica*, and Theory and Practice of Pharmacy.

Toxicology, the science of poisons, and *Microscopy*, which requires the use of optical instruments called Microscopes, form valuable collateral and special subjects of study.

Practical Pharmacy is that branch of Pharmacy which treats of the operations, processes, and methods used in applying the principles of theoretical pharmacy. The practice of pharmacy will receive in this treatise much the greater share of attention; separate text-books on the sciences pertaining to the theory of pharmacy are now very accessible, and these may be referred to for specific and systematic information.

PHARMACOPŒIAS AND DISPENSATORIES.

A *pharmacopœia*, in the modern acceptance of the word, is a book containing a list of medicinal substances,¹ with descriptions, tests, and formulas for preparing the same, selected by some recognized authority. The necessity for legalized standards to define the character, establish the purity, and regulate the strength of medicines is recognized by all civilized nations; and although all of the nations of the globe have not yet formally adopted national standards, in nearly every case where this has not been done it will be found that the standards of some other country are in use. The most important pharmacopœias, with the dates of their last issue, are as follows:

OFFICIAL PHARMACOPŒIAS.²

<i>Nation.</i>	<i>Date of Issue.</i>	<i>Title.</i>
1. UNITED STATES	1898	Pharmacopœia of the United States of America. Seventh Decennial Revision (1890).
2. GREAT BRITAIN AND IRELAND AND COLONIES	1885	British Pharmacopœia.
3. GERMANY	1890	Arzneibuch für das Deutsche Reich (Pharmacopœia Germanica).
4. FRANCE	1884	Codex Medicamentarius (Pharmacopée Française).
5. AUSTRIA	1889	Pharmacopœia Austriaca.
6. BELGIUM	1885	Pharmacopœia Belgica.
7. CHILI	1886	Farmacopea Chilena.
8. CROATIA-SLAVONIA	1888	Pharmacopœia Croatico-Slavonica.
9. DENMARK	1893	Pharmacopœia Danica.
10. GREECE	1868	Ἑλληνικὴ Φαρμακοποιία.
11. HUNGARY	1888	Pharmacopœia Hungarica.
12. INDIA (EAST INDIES)	1868	Pharmacopœia of India.
13. ITALY	1892	Farmacopea ufficiale del Regno d'Italia.
14. JAPAN	1891	Pharmacopœia Japonica.
15. MEXICO	1884	Nueva Farmacopea Mexicana.
16. NETHERLANDS	1889	Pharmacopœia Neerlandica.
17. NORWAY	1879	Pharmacopœia Norwegica.
18. PORTUGAL	1876	Pharmacopœia Portuguesa.
19. ROUMANIA	1874	Pharmacopœia Romana.
20. RUSSIA	1891	Pharmacopœia Rossica.
21. SPAIN	1884	Farmacopea oficial Española.
22. SWEDEN	1879	Pharmacopœia Suecica.
23. SWITZERLAND	1893	Pharmacopœia Helvetica.

¹ The word "official" is now used to designate pharmacopœial substances or preparations, the term "official" being obsolete in this connection; the latter is properly applied to substances or preparations kept in the shop but not recognized by a pharmacopœia.

² This list has been kindly revised by Charles Rice, Ph.D., 1894.

NOTES ON OFFICIAL PHARMACOPŒIAS.

1. In quoting this title, it is customary to abbreviate it to "U. S. P. (1890)." It is advisable to adhere to this form so as to preserve uniformity. The "seventh revision" means, of course, the same as "eighth edition."
2. A supplement under the title "Additions made in 1890 to the British Pharmacopœia of 1885" was published in 1890. A new Imperial Pharmacopœia is in preparation.
3. A supplement to the German Pharmacopœia, with the title "Nachtrag zum Arzneibuch des Deutschen Reiches," appeared at the end of 1893.
10. The Greek Pharmacopœia of 1868 is a reprint of that of 1837, with copious additions. It is no longer in practical use. The French and German Pharmacopœias are generally followed.
12. An addendum to the Pharmacopœia of India appeared in 1869. At present the British Pharmacopœia has practically superseded the work.
15. The Mexican Pharmacopœia is prepared and published by a Committee of the Mexican Pharmaceutical Society, but the government recognizes the work. A supplement ("Apendice") was published in 1890.
17. The Norwegian Pharmacopœia of 1879 is a reprint of the revision of 1870, with additions.
22. The Swedish Pharmacopœia of 1879 is the third reprint of the revision of 1869, with additions.
23. The Swiss Pharmacopœia is published simultaneously in three languages,—German, French, and Italian.

WORKS OF REFERENCE USED IN COUNTRIES POSSESSING NO NATIONAL PHARMACOPŒIA.

In France, Spain, Central and South American countries, and those West Indian Islands where French or Spanish is the principal language, the most generally used, unofficial work of reference is Dervault's "L'Officine," an extensive commentary and supplement to the French Pharmacopœia, either in the French original, or in its Spanish translation and adaptation by Pontes.

- ARGENTINE REPUBLIC.**—French and Spanish Pharmacopœias. Also (not official) *Tratado de Farmacia y Farmacognosia*. By Carlos Murray.
- BOLIVIA.**—French, Spanish, and Chilian Pharmacopœias.
- BRASIL.**—French, Portuguese, and Spanish Pharmacopœias. Also (not official) *Formulario ou Guia Medica*, etc. By P. L. N. Chernovitz. *Novo Formulario medico e pharmaceutico*, ou *Vademecum Medicum*. By Th. J. H. Langgaard.
- CENTRAL AMERICAN STATES.**—French, Spanish, and Mexican Pharmacopœias. Also, to some extent, the British and that of the United States.
- CHINA.**—The native druggists and herbalists still regard as their chief authority the old Chinese Encyclopedia of natural history, entitled *Pen-tao kang-mu*, composed by Li-shi-chin between 1652 and 1678. The usual editions of this work are printed in 40 thin volumes, 8vo. Foreign pharmacists use the pharmacopœias of their respective countries. The British is most in use.
- CUBA.**—The Spanish and French Pharmacopœias.
- ECUADOR.**—French and Spanish, also several foreign pharmacopœias.
- HAYTI.**—French and Spanish Pharmacopœias (chiefly).
- HAWAIIAN ISLANDS.**—Chiefly the United States Pharmacopœia. To some extent, also, the British and the German.
- LIBERIA.**—The United States Pharmacopœia (chiefly).
- PERU.**—The French, Spanish, British, and United States Pharmacopœias.
- TURKEY.**—The French Pharmacopœia.
- URUGUAY.**—The French and Spanish Pharmacopœias. Occasionally, also, the British and that of the United States.
- YENNEKULA.**—The French and Spanish Pharmacopœias (chiefly). Also, occasionally, the British and that of the United States.

The official Pharmacopœias are all issued under the authority of the respective governments, with the exception of the United States Pharmacopœia (which has, however, been accepted by the government and a number of the individual States, especially New York and Ohio, as a standard in some of the departments), the policy of the nation having been against interference in matters which relate to restrictions upon professional practice. This course has not prevented the acceptance of the work by physicians and pharmacists as an authoritative guide, whilst it has probably encouraged a greater freedom in criticism, and thus

developed more general interest in a standard and a stronger desire for improvement than could have been obtained through compulsory legislation. Efforts are constantly put forth to secure the adoption of an International Pharmacopœia. If these should prove successful, a great advance will be made in bringing about a uniformity in the strength of preparations; yet it may well be doubted whether such a work would be as generally useful as the Pharmacopœias at present in use, which have been proved by long experience best adapted to the varying needs of the different nations.

The Pharmacopœia of the United States (1890), Seventh Decennial Revision, was prepared by a committee appointed by the National Convention for revising the Pharmacopœia, which met in Washington, D.C., May 7, 1890. Fifty-five medical bodies and fifty-five incorporated pharmaceutical organizations sent delegates to this convention, which selected from those present twenty-six members, consisting of fifteen pharmacists and eleven physicians, who were designated the Committee of Revision and Publication of the Pharmacopœia of the United States of America. As this book will be largely quoted in this treatise, its plan and the outlines of its main features should be thoroughly understood at the outset.

Nearly one thousand substances (989), embracing crude drugs and preparations, have been deemed of sufficient importance to merit a place in the United States Pharmacopœia. These substances were formerly divided into two classes, "Materia Medica" and "Preparations;" the former class contained a list of medicines which were either crude drugs or were furnished by manufacturers and not usually prepared by the pharmacist; the latter class was composed of formulas or processes indicating how preparations were to be made. At the Sixth Decennial Revision this arbitrary method of division was dropped, and a strictly alphabetical arrangement of all the substances adopted: this facilitates a ready reference, and disarms criticism upon a method of classification.

NOMENCLATURE.

The titles of the various substances are indicated—1st. By the **OFFICIAL NAME**, which is always in the Latin language. 2. By the **ENGLISH NAME**. 3d. By the **SYNONYME**. 4th. By the **BOTANICAL NAME** (in the case of plants). 5th. By the **SYMBOLIC FORMULÆ** (in the case of chemicals). Each of these names has a special use.

The following extracts from the Pharmacopœia are given in illustration:

CANTHARIS.	[Official name.]	EMULSUM AMYGDALÆ.
CANTHARIDES.	[English name.]	EMULSION OF ALMOND.
[SPANISH FLIER.]	[Synonyme.]	[MILK OF ALMOND.]
BISMUTHI CITRAS.	[Official name.]	SINAPIS ALBA.
BISMUTH CITRATE.	[English name.]	WHITE MUSTARD.

$\text{BiCl}_3 \cdot \text{H}_2\text{O}_7 = 397.44.$ [Symbolic formula.]

The seed of *Brassica alba*. [Official definition, botanical name in italics.]

1. The **Official Name**.—Example, **CERATUM CANTHARIDIS**. The official name is thoroughly distinctive, and is intended to be used

in designating the drug or preparation where precision is required, as in writing prescriptions, in labelling store-furniture, specimens, etc. Latin is selected for the official title because it is universally used and understood as the "language of science," and is not liable to change, as is the case with a living tongue. Although the official names are usually abbreviated in practice,¹ the proper terminations and full titles should be known and observed carefully, and the habit of using the Latin abbreviations in English conversation strictly guarded against as not only inelegant, but vulgar.² A vast amount of careful consideration, extending over many years, has been expended in perfecting a system of pharmacopœial nomenclature which is at once "brief, simple, expressive, distinctive, and convenient." The following may be cited as models: *Allium*, *Camphora*, *Opium*, *Rheum*, *Sapo*, etc., the full pharmacopœial definition of these titles being, respectively, *Allium*. "The bulb of *Allium sativum* Linné (Nat. Ord., *Liliaceæ*)."³ *Camphora*. "A stearopten (having the nature of a ketone) obtained from *Cinnamomum Camphora* (Linné) Nees et Ebermaier (Nat. Ord., *Laurineæ*), and purified by sublimation."³ *Opium*. "The concrete, milky exudation obtained by incising the unripe capsules of *Papaver somniferum* Linné (Nat. Ord., *Papaveraceæ*), and yielding, in its normal, moist condition, not less than nine (9) per cent. of crystallized morphine, when assayed by the process given below."³ *Rheum*. "The root of *Rheum officinale* Baillon (Nat. Ord., *Polygonaceæ*)."³ *Sapo*. "Soap prepared from soda and olive oil." The official definition in each case indicates as plainly as possible the source and the particular form of the drug or substance which is to be selected. The generic or genus name (the first part of the botanical name) was generally chosen for the official title, as, *Pilocarpus*, the official name for "the leaflets of *Pilocarpus Selloanus*" (botanical name). In the case of some old and very well known drugs, this rule could not be adopted without causing confusion, and the *specific* or species name (the second part of the botanical name) was retained, as *Ipecacuanha*, the official name for "the root of *Cephaelis Ipecacuanha*." The official title obviously cannot retain the simplicity of a single word where two parts of the same plant are official; thus, for example, the root and seed of *Colchicum* must each be defined by affixing the Latin name of the particular part of the plant intended, as, *Colchici Radix* for *Colchicum* Root and *Colchici Semen* for *Colchicum* Seed; nor can a single word be chosen for either official title where the specific names of two or more plants of the same genus differ; the generic name of the two official mints is *Mentha*, and to distinguish them it is necessary to use the full botanical name for each,—thus, *Mentha Piperita* (Peppermint), *Mentha Viridis* (Spearmint).

There are a very few exceptions to the above principles of nomenclature, as in the case of *Pareira* and *Prunus Virginiana*, derived, according to the most recent and reliable authorities, respectively from *Chondo-*

¹ See table of abbreviations in chapter on Prescriptions.

² Example of what should be avoided in conversation: "I mixed the *Pulc. Pip. Nig.* with the *Pot. Carb.* and the *Muc. Trag.*, but could not form a mass."

³ The words enclosed in quotation-marks are appropriately termed the official definition.

dendron tomentosum and *Prunus serotina*; these drugs are largely used, and the old names have become so well established that it would lead to confusion and possibly embarrassing mistakes to change them now. The Latin names are generally used in the singular number, although the definition of the drug distinctly indicates plurality; for instance, *Galla* is the official name for *nutgalls*, as they are termed commercially, and is in the nominative singular (plural, *Gallæ*); the official definition indicates the singular, being "An excrescence on *Quercus lusitanica*." *Anthemis* (nominative singular) is the official name for the flower-heads of Chamomile. The reason assigned in the preface to the U. S. Pharmacopœia, 1850, for this apparent deviation, is that "the example of the Roman medical writers, particularly of Celsus, might be followed." In the case of compound medicines, such official titles were selected as would usually express the composition of the preparations as fully as possible, indicating the principal ingredients without sacrificing the important consideration of brevity and convenience in abbreviation, as, *Mistura Rhei et Sodæ*, *Mistura Cretæ*, *Pulvis Ipecacuanhæ et Opii*, *Tinctura Opii Camphorata*, *Tinctura Aloes et Myrrhæ*. Where the number of important ingredients in a preparation is too great to admit of a selection, the participial adjective *compositus* (meaning compound) is added, the feminine (*composita*) or neuter (*compositum*) termination being used respectively where the noun is feminine or neuter, as *Spiritus Juniperi Compositus* (masc.), *Tinctura Lavandulæ Composita* (fem.), *Extractum Colocynthis Compositum* (neut.).

2. The English Name.—Example, SOLUTION OF AMMONIUM ACETATE.—The English name should be used when the drug or preparation is mentioned in ordinary conversation, in commercial transactions, in writing orders for supplies, and in all cases where the use of the Latin official name could be justly criticised as an ostentatious display of erudition. In the U. S. Pharmacopœia, 1880, a large number of English names used in former Pharmacopœias were changed, the old vernacular names being either dropped altogether or inserted as synonyms: this advanced step was rendered necessary by the increase in articles used in the materia medica and by a desire for greater accuracy and better methods in nomenclature. The confusion which always exists in different localities concerning the common names of drugs is also avoided, as the anglicized Latin name is distinctive. The former English names *Irish Moss*, *Pipsissewa*, *Butternut*, and *Wormseed*, for instance, are replaced by *Chondrus*, *Chimaphila*, *Juglans*, and *Chenopodium*.

On the other hand, some of the common English names were so fixed by usage that it was not deemed judicious to alter them; besides, to have changed them would have often substituted a longer and less convenient word. The retention of the English names *Cloves*, *Elm*, *Hops*, and *Ginger* sufficiently illustrates this.

In the U. S. Pharmacopœia, 1890, a very important change has been made in the English names of the chemical substances, the basylous or metallic component being now given the first place; for instance, *potassium citrate*, *ammonium bromide*, and *zinc sulphate*, replace the former names *citrate of potassium*, *bromide of ammonium*, and *sulphate of zinc*.

This change requires many alterations in nomenclature, but it was a necessary step for the Committee of Revision to make the names accord with the established usage of the best modern chemical writers. The salts of iron and mercury have been differentiated by the use of the terms *ous* and *ic* respectively to designate lower and higher forms of the salts; for example, ferrous sulphate and ferric sulphate, mercurous iodide and mercuric iodide, are now used in preference to sulphate of iron and iodide of mercury; the compounds of mercury, on account of the differences in dose existing among them, are further distinguished by the use of the adjectives "corrosive," "mild," "red," "yellow." For the scale salts of iron, which are of complex composition and not true chemical salts, notwithstanding the fact that the metallic component exists in them in the ferric state, the term "iron" has been retained, in order to emphasize the fact of their defective chemical construction, for they are not definite double salts.

The pharmacopœial names of chemical substances do not always represent their chemical composition: the enormous multiplication of synthetic remedies, and the length of the systematic names of these bodies, have compelled the use of shorter terms which are more conveniently employed in prescriptions and in commercial transactions: thus, "metadioxybenzol" is a more cumbersome word than "resorcin," "phenyl salicylate" than "salol." If we turn to unofficial substances, a better example is afforded by the use of "trional" for "triethylsulphonmethylethylmethane;" but this is eclipsed by "analgen," which is dignified by the systematic name of "orthoethyloxyanamonobenzoylamidochinoline."

3. The Synonyme.—Example, [SPIRIT OF MINDERERUS.] In the Pharmacopœia the definition of the term synonyme is restricted to an equivalent name in common use, which is usually antiquated and derived from an unscientific source, and which should really be abandoned, but which common custom and long usage demand shall not be entirely ignored. The synonymes should be rarely or never used, yet it is necessary for the student to be familiar with them in order to recognize their equivalent official or English names when they are used by others. Common names, as snakeroot, dock, Indian hemp, balm, etc., have varying and often opposite meanings in different localities, and confusion and even loss of life have resulted from the unfortunate use of these common names.

4. The Botanical Name.—By this is meant the systematic name recognized by botanists for plants, which serves in pharmacopœial nomenclature as the basis of the official name. The botanical name usually consists of two Latin words, the first indicating the genus and the second the species to which the plant belongs. *Capsicum fastigiatum* is the botanical name for the particular variety of capsicum or Cayenne pepper which the Pharmacopœia designates; here the generic or first name is chosen for the official title, and if no description followed the title it would be inferred that any part of any plant in the genus "Capsicum" could be officially used for making preparations; but the specific name, "fastigiatum," limits the use to this species, whilst the description which follows shows the *part* of the plant which must be employed:

"the fruit of *Capsicum fastigiatum*." Now, *Capsicum baccatum*, *Capsicum frutescens*, *Capsicum annuum*, belonging to different species, are active members of the genus, but their claims are unrecognized, and the fruit from these species is not official. The specific name does not begin with a capital letter, except when it has been at some previous time itself a generic name, as in *Rhamnus Frangula*, or when it is derived from the name of a person, as in *Garcinia Hanburii*, or when the word is indeclinable, as in *Theobroma Cacao*, or when it is a combination of a noun and an adjective, as in *Xanthoxylum Clava-Herculis*. The name of the author follows the botanical name, as, *Capsicum fastigiatum* Blume, and after this the Natural Order¹ to which the plant belongs is indicated in italics, and the whole enclosed in parentheses, as, (Nat. Ord., *Solanaceæ*). It must be apparent that the botanical name need not be employed either in writing or speaking in ordinary pharmaceutical work; but its use is absolutely necessary in establishing the identity of any drug authorized by the Pharmacopœia, and hence it is important to know the botanical names.

5. The Symbolic Formulæ.—The adoption of certain arbitrary symbols² to represent chemical elements leads to a most convenient and useful application, whereby the composition of a chemical is expressed with the utmost brevity and exactness. *Plumbi Iodidum* and *Lead Iodide* are both much longer terms than " PbI_2 ," and not so definite. *Sodium Sulphite* does not always contain the same proportion of water of crystallization, and if the symbolic formula, $Na_2SO_3 \cdot 7H_2O$, were not appended to the official title there might be some doubt about which sulphite was intended: the added $7H_2O$, however, accurately defines it. The figures which follow the symbolic formulæ indicate the *molecular weight* (the sum of the weight of the atoms) of the chemical: thus, in $MgSO_4 \cdot 7H_2O = 245.84$, the atomic weight of Magnesium Mg , 24.3, is the first factor; this added to Sulphur S , 31.98, makes 56.28; Oxygen O , 15.96, multiplied by 4, gives 63.84; then Hydrogen having the atomic weight of 1 if multiplied by 2 and this by 7 gives 14, and seven times O , 15.96, is 111.72; then $56.28 + 63.84 + 14 + 111.72 = 245.84$, the molecular weight of magnesium sulphate.

The Official Description.—Immediately following the official definition of the substances there will be noticed in the Pharmacopœia, in smaller type, what has been termed the *official description*: this consists, usually, in drugs, of a concise statement of their physical characteristics, whilst in some cases tests of identity, with descriptions of the substances used as adulterants, are appended. In the chemicals the official definition is usually replaced by the symbolic formulæ, and these are followed immediately by the official description, which is printed in smaller type, exactly as in the case of the drugs; to this description are usually added the solubilities, with the tests of identity and purity of the substance. The following examples, selected from the Pharmacopœia, are given in illustration:

¹ See index for chart of drugs arranged according to the Natural Orders.

² See index for table of elements, with symbols and atomic and molecular weights.

MYRRHA.	[Official name.]	AMMONII NITRAS.
MYRRH.	[English name.]	AMMONIUM NITRATE.
A gum-resin obtained from <i>Commiphora Myrrha</i> (Nees) Engler (Nat. Ord., <i>Burseraceae</i>).	[Official definition.]	[Symbolic formula.] $\text{NH}_4\text{NO}_3 = 79.9.$
In roundish or irregular tears or masses, dusty, brownish-yellow or reddish-brown; fracture waxy; . . . taste bitter and acrid. When triturated with water, Myrrh yields a brownish-yellow emulsion; with alcohol it yields a brownish-yellow tincture which acquires a purple tint on the addition of nitric acid.	[Official description.]	Colorless crystals, generally in the form of long, thin, rhombic prisms, or in fused masses. . . . Soluble in 0.5 part of water and in 20 parts of alcohol; very soluble in boiling water and in 3 parts of boiling alcohol. . . . The aqueous solution, when acidulated with nitric acid, should not be affected by test-solution of silver nitrate. . . .

THE PREPARATIONS OF THE PHARMACOPŒIA.

Although these will be considered in detail in the body of this work, a few general remarks on them will be appropriate here. The "parts by weight" plan adopted by the U. S. Pharmacopœia, 1880, was dropped in the 1890 revision, and the "solids by weight, liquids by measure" principle accepted. This is more in accord with the methods used in English-speaking countries. A great advance was made by the adoption of the metric system for expressing the quantities, which were thus also made definite. Every pharmacist should employ the metric system exclusively in making preparations; but on account of the revolutionary changes made necessary by the adoption of this system of weights and measures, corresponding quantities are given in the working formulas in this work, which are based on the old system of avoirdupois weight and apothecaries' measure. The latter will be found much less convenient than the metric quantities, especially if the operator has procured a set of metric weights and measures and has used them a few times.

DISPENSATORIES.

A dispensatory is a commentary on a pharmacopœia. The U. S. Pharmacopœia describes the drugs and chemical substances of the *materia medica*, establishes the degree of purity of many of them, and defines the strength of the preparations. The dispensatories comment on the substances, giving their physical, medical, and pharmaceutical history, with their doses and uses. The number of substances noticed in the Pharmacopœia is limited to such as are in common and frequent use in some section of the country. On the other hand, the dispensatories aim to present information about those which are official in our own and other Pharmacopœias, and those which are of occasional or rare use, in addition. There are at present two dispensatories which comment on the *materia medica* and preparations of the U. S. Pharmacopœia of 1890,—the United States Dispensatory,¹ which was first published in 1833, and the National Dispensatory, which was first issued in 1879.² The plans of these works are similar: the text of the Pharmacopœia is first inserted, and immediately following are appended the comments of the authors and editors. The arrangement of the subjects is now

¹ *United States Dispensatory*, 17th edition, edited by Wood, Remington, and Sadtler, published by J. B. Lippincott Company, Philadelphia.

² *National Dispensatory*, Stillé and Maisch, published by Lea Brothers & Co., Philadelphia.

strictly alphabetical, the United States Dispensatory dividing them, however, into two classes, distinguished by type of two sizes: the principal portion of the work, that in the largest type, is devoted to a commentary on the preparations of the United States and other Pharmacopœias; the unofficial and less important subjects are to be found in the second part. In the National Dispensatory the unofficial substances are considered either in the body of the book or under subdivisions as allied drugs. The possession of a reliable commentary upon the Pharmacopœia is a *necessity* which is fully realized by pharmacists, and in the consideration of the subjects in the succeeding chapters of this work this fact has not been lost sight of. The United States Dispensatory is now preferred as a guide, and hence will be frequently quoted.

QUESTIONS ON INTRODUCTORY CHAPTER.

Define Pharmacy. (See page 25.)

In what respects is Pharmacy an art as well as a science, and what does it comprehend?

Is the word Pharmacy ever applied to any particular place? If so, how?

Into what two classes is Pharmacy divided?

Name and define the sciences which form the basis of Theoretical Pharmacy.

Define Materia Medica.

What is the name of the science which treats of crude drugs?

In what respect does this science differ from Pharmacy in its specific sense?

What is Toxicology?

Of what does Microscopy treat?

Define Practical Pharmacy.

What is a Pharmacopœia?

Explain what is meant by the terms "official" and "official."

Give the titles and last dates of issue of four of the most important Pharmacopœias.

Are all Pharmacopœias issued under authority of government?

If not, name an exception.

When was the present U. S. Pharmacopœia prepared?

How was it prepared?

How many members constituted the final committee of revision?

How many substances having separate titles are contained in the Pharmacopœia?

What classification or arrangement of the various drugs and medicines has been accepted?

In the nomenclature of the Pharmacopœia, how are the titles of the various substances indicated?

What is the official name of White Mustard?

What is the botanical name of White Mustard?

What is the English name of Cantharis?

What is the synonyme of Cantharis?

What is the symbolic formula of Bismuthi Citras?

What is the official definition of Sinapis Alba?

What is the object of having an official name, and what use is made of it?

Why is the Latin language selected for the official names?

Under what circumstances is it allowable to abbreviate official names?

When are abbreviations improper?

What does the official definition indicate?

In choosing the official name, what part of the botanical name of a plant is preferred?

What exceptions are there to this rule?

When several parts of the same plant are used, how are they distinguished?

When two or more plants of the same genus are official, how are they distinguished?

Are the Latin names of drugs usually in the singular or the plural number?

What reason is assigned for this?

In the case of compound medicines, how have the names been selected?

Where medicines have too many important ingredients to admit of selection, how have they been named?

What is meant by the English name of a pharmaceutical substance?

Under what circumstances should the English name be used?

The common or popular names having been discarded and other names substituted, what, for example, are the present names of the drugs formerly known as Irish Moss, Pipsissewa, Bittersweet, Wormseed?

Why has this change been made?

Have all the common names been changed? If not, give an example and the reason why it was not changed.

What important change in the English names of chemical substances was made in the U. S. Pharmacopoeia of 1890? Why was this done?

How are the higher and lower forms of the salts of iron and mercury differentiated? Give an example.

How are the compounds of mercury further distinguished?

Why is the term "iron" retained for the scale salts of iron?

Do the pharmacopoeial names of chemical substances always represent their chemical composition? If not, give an example of one that does not, and the reason for not using the systematic name.

What is meant by a synonyme?

Is it desirable to increase the use of synonymes?

Why are they used?

What is meant by the botanical name of a plant?

How is it usually derived?

Why is it important to know the botanical names of plants?

What is the meaning of the official abbreviation "Nat. Ord." used after the botanical name?

What are symbolic formulas?

What are the objects of their employment?

What do the figures following a symbolic formula indicate?

What is meant by molecular weight?

What is an atom?

What is meant by the official description of a drug?

What are the objects of having official descriptions?

Describe the principle of weight and measure adopted by the U. S. Pharmacopoeia of 1890.

How are the quantities expressed in the late Pharmacopoeia? Which system is preferable?

What is a Dispensatory?

Name the two principal Dispensatories published in the United States.

PART I.

CHAPTER I.

METROLOGY.

Weight, Measure, and Specific Gravity.

Metrology formerly and according to its strictest signification meant the science of measures, but its present definition includes the measure of the gravitating force of bodies, which always bears a direct ratio to their mass, and is commonly called *weight*; the determination of the bulk or extent of the body, its *measure*; and the relation which measure bears to weight when compared with a standard is known as *specific gravity*.

WEIGHT.

A knowledge of the systems of weights and measures in use must necessarily command the early attention of the student, and a short account of the origin of the present systems may be of service in fixing upon the mind the essential distinctions between them. The sense of the weight of a body cannot be conveyed intelligibly to the mind unless a means of comparison is chosen, and as weight is the measure of the gravitating force of a body, so this force is expressed as related to a standard of resistance, this being exactly that which would balance the body and keep it in equilibrium. Such standards are termed *weights*.

The standards which have been chosen by various nations are arbitrary, and instances are common where different standards are in use at the same time in the same country. Many of the ancient standards are clearly referable to parts of the human body, as nail, foot, span, pace, cubit (length of the forearm), orgyia (stretch of the arms). In the history of metrology three periods may be traced: 1. The *Ancient*, during which the old classical standards originated, and which terminated with the decline of the Roman Empire. 2. The *Mediæval*, extending to the sixteenth century. In this period the old standards were lost, but their names were preserved, and European nations adopted various independent standards. 3. The *Modern*. Since the seventeenth century the efforts of most enlightened nations have been directed towards greater

accuracy and simplicity, and during the present century towards international uniformity.

In Great Britain, in the year 1266, the 51st act of the reign of Henry III. declares "that by the consent of the whole realm of England the measure of the King was made,—that is to say, that an English silver penny called the sterling, round and without clipping, shall weigh *thirty-two grains of wheat*, well dried and gathered out of the middle of the ear; and twenty pence (pennyweights) do make an ounce, and twelve ounces a pound, and eight pounds do make a gallon of wine, and eight wine gallons do make a bushel, which is the eighth of a quarter."

The sixteen-ounce pound (avoirdupois) was derived from a more ancient source, and was undoubtedly of Roman origin, and introduced at the time of the first civilization of the British island. The word "haberdepois," according to Gray, was, however, first used in English laws in 1303.

A statute of Edward I. (A.D. 1304) states "that every pound of money or of medicines is of *twenty shillings weight*, but the pound of all other things is *twenty-five shillings weight*. The ounce of medicines consists of *twenty pence*, and the pound contains *twelve ounces* (the Tower Pound), but in other things the pound contains *fifteen ounces*, in both cases the ounce weighing twenty pence."

These laws unfold the theory of the ancient weights and measures of Great Britain, and reveal the standard,—i.e., a natural object, grains of wheat; a difference existed then between the troy and the avoirdupois pound, but the weights now in use are one-sixteenth heavier than those of Edward I., owing to the change made in the value of the coin by the sovereign subsequently; in addition to this, the true pennyweight standard was lost, and on the next revision of the weights and measures the present troy and avoirdupois standards were adopted. The old Tower or troy ounce and the avoirdupois ounce were intended to have the same weight, but after the revision it was found that the troy ounce was heavier than the avoirdupois ounce by forty-two and a half grains.

The subsequent adoption of troy weight by the London College of Physicians in 1618, on the recommendation of Sir Theodore Turquet de la Mayerne, who compiled their first Pharmacopœia, has entailed upon all apothecaries who are governed by British customs, to this day, the very great inconvenience of buying and selling medicines by one system of weights and compounding them by another.

In the next century efforts were made towards reforming the standards, and the Royal Society, in 1736, began the work, which ended in the preparation, under the direction of the House of Commons, by Mr. Bird, of the standard "yard" and standard "pound" troy in 1760. Copies of these have been made, no intentional deviation has been made since, and they are still the standards used most largely in the United States. In 1816, on account of the growing popularity of the French metrical system, and in view of the desirability of securing a standard which could easily be recovered in case of loss or destruction and which should be commensurable with a simple unit, steps were taken in England to secure these advantages. The labors of English scientists

led to the adoption of the *Imperial* measures and standards, which were legalized January 1, 1826, and are now in general use in Great Britain.

In this system the *yard* is equivalent to 36 inches, and its length was determined by comparison with a pendulum beating seconds of mean time, in a vacuum, at the temperature of 62° F. at the level of the sea, in the latitude of London, which length was found to be 39.1393 inches. The *pound troy* (containing 5760 grains) was determined by comparison with a given measure of distilled water under certain conditions: thus, a cubic inch of distilled water was weighed with brass weights in air at 62° F., the barometer at 30 inches, and it weighed 252.458 grains. The standard for measures of capacity (either dry or liquid) is the *gallon*, and this contains 10 pounds avoirdupois (each 7000 grains) of distilled water weighed in air at 62° F., the barometer standing at 30 inches; the *bushel* containing 8 such gallons. In 1819–20 efforts were made in the United States to secure uniformity in the standards which were in use by the several States. Finally, after a lengthy investigation, the Secretary of the Treasury, on June 14, 1836, was directed by Congress to furnish each State in the Union with a complete set of the revised standards, and thus we have the *troy pound* (5760 grains), the *avoirdupois pound* (7000 grains), and the *yard* (36 inches) all identical with the British standards; but the *gallon* is quite different, the old wine gallon of 231 cubic inches, containing 58372.2 grains of distilled water at its maximum density, weighed in air of the temperature of 62° F., the barometer standing at 30 inches, *being retained*, whilst the bushel contains 77.6274 pounds of water under the same conditions.¹ In 1864 the use of the metric measures was legalized in Great Britain, but not made compulsory, and in 1866 the United States followed the same course.

Apothecaries' Weight (also called Troy Weight).

Pound.		Troy Ounces.		Drachms.		Scruples.		Grains.
lb 1	=	12	=	96	=	288	=	5760
		3 1	=	8	=	24	=	480
				3 1	=	8	=	60
						9 1	=	gr. 20

The British Pharmacopœia has adopted avoirdupois weight, which is also in general use in the United States for commercial purposes.

Avoirdupois Weight.

Pound.		Ounces.		Grains.
lb 1	=	16	=	7000
		oz. 1	=	437.5

It will be observed that the troy ounce contains $42\frac{1}{2}$ grains *more* than the avoirdupois ounce, whilst the troy pound contains 1240 grains *less* than the avoirdupois pound. Fortunately, one unit common to troy, apothecaries', and avoirdupois weight has been saved,—namely, *the grain*. The abbreviations of the denominations of apothecaries' weight are represented by the signs ℥, ounce, 3, drachm, ʒ, scruple, and gr. grain; these have long been in use, but are very likely to be mistaken for one

¹ Slight variations in these original equivalents are recommended by various investigators, and have been in use since Hassler made his report in 1832. (See Barnard on the Metric System, page 153.)

another in rapid or careless writing. The abbreviations or signs for avoirdupois weight differ from those of troy weight, and care should be used not to confound them; they are lb., pound, oz., ounce, gr., grain.

MEASURES.

Apothecaries' or Wine Measure, U.S.

Gallon.	Pints.	Fluidounces.	Fluidrachma.	Minims.
Cong. 1	= 8	= 128	= 1024	= 61440
	0 1	= 16	= 128	= 7680
		f℥ 1	= 8	= 480
			f℥ 1	= ℥ 60

Imperial Measure, Br.

(Adopted by the British Pharmacopœia.)

Gallon.	Pints.	Fluidounces.	Fluidrachma.	Minims.
C. 1	= 8	= 160	= 1280	= 76800
	0 1	= 20	= 160	= 9600
		fl. oz. 1	= 8	= 480
			fl. dr. 1	= min. 60

When the subject of the weights and measures in ordinary use is studied, the want of simplicity and close relation is clearly apparent. The pint of distilled water at 15.6° C. (60° F.) weighs 7291.2 grains, the fluidounce 455.7 grains, and we have thus three ounces in use of different values,—troy ounce 480 grains, avoirdupois ounce 437.5 grains, and fluidounce 455.7 grains.

The Imperial measure differs from our wine measure principally in having twenty fluidounces in the pint instead of sixteen: a convenient relation exists, however, between measure and weight in the *Imperial gallon, which contains ten avoirdupois pounds of water* at 15.6° C. (60° F.).

The Imperial fluidounce contains the same number of grains as the avoirdupois ounce (437.5), which is 18.2 grains less than that of the U. S. fluidounce of water at the same temperature (455.7). Although this difference may be considered trifling in one fluidounce, it is not so when multiplied by four or eight, and this is one serious objection to the use of the English graduated measures in the United States, because they indicate Imperial fluidounces instead of U. S. fluidounces.

Approximate Measures.

In apportioning doses for a patient, the practitioner is usually compelled to order the liquid medicine to be administered in certain quantities that have been established by custom, and estimated as follows:

A tumblerful	f℥ viij.
A teacupful	f℥ iv.
A wineglassful	f℥ ij.
A tablespoonful	f℥ iv.
A dessertspoonful	f℥ ij.
A teaspoonful	f℥ i.
A drop, through a popular error, is considered to be	1 minim. ¹

In almost all cases the modern teacups, tablespoons, dessertspoons, and teaspoons, after careful tests by the author, were found to average twenty-five per cent. greater capacity than the theoretical quantities given above; and the use of accurately graduated medicine-glasses, which may be had now at a trifling cost, should be insisted upon.

¹ See comparative table, p. 73.

The Metric System.—This system, which originated with Prince de Talleyrand, Bishop of Autun, France, in 1790, seems destined to become universal, as it is now legally used by the majority of all civilized nations, and finds especial favor with scientists even in countries where its use is not compulsory. The starting-point was the *unit of length*, the metre, which is the $\frac{1}{40,000,000}$ part of the earth's circumference around the poles. From this, the *unit of capacity* was derived, the litre, which is the cube of $\frac{1}{10}$ part of a metre. The *unit of weight*, the gramme, was also derived from the metre, it being the weight of that quantity of distilled water, at its maximum density, 4° C. (39.2° F.), which will fill the cube of $\frac{1}{1000}$ part of a metre.¹ The name Metrical System, it will thus be seen, is very appropriate, as *each unit is derived from the metre*; it is also known as the *Decimal System*, because in obtaining the multiples and subdivisions the number ten (*decem*) is used solely. The prefixes, which indicate *multiplication*, are of Greek derivation, and are usually spelled with a capital letter,—**Deka**, 10, **Hecto**, 100, **Kilo**, 1000, **Myria**, 10,000; whilst *division* of the units is expressed by Latin prefixes, the initial letters not being capitals,—*deci*, $\frac{1}{10}$, *centi*, $\frac{1}{100}$, *milli*, $\frac{1}{1000}$. The word Gild has been suggested as a useful mnemonic, thus,—

G I L D
reek ncreases, atin ecreases.

The following table gives a view of the system adapted to the use of the student :

Abbreviation. Metre.			Abbreviation. Litre.			Abbreviation. Gramme.		
1 milli metre, mm. =	.001		1 milli litre, ml. =	.001		1 milli gramme, mg. =	.001	
1 centi metre, cm. =	.01		1 centi litre, cl. =	.01		1 centi gramme, cg. =	.01	
1 deci metre, dm. =	.1		1 deci litre, dl. =	.1		1 deci gramme, dg. =	.1	
Metre, M.	1.		Litre, L.	1.		Gramme, Gm.	1.	
1 Deka metre, Dm. =	10.		1 Deka litre, Dl. =	10.		1 Deka gramme, Dg. =	10.	
1 Hecto metre, Hm. =	100.		1 Hecto litre, Hl. =	100.		1 Hecto gramme, Hg. =	100.	
1 Kilo metre, Km. =	1000.		1 Kilo litre, Kl. =	1000.		1 Kilo gramme, Kg. =	1000.	
1 Myria metre, Mm. =	10000.		1 Myria litre, Ml. =	10000.		1 Myria gramme, Mg. =	10000.	

In pharmaceutical practice a number of the above measures are rarely or never used. Of the measures of length, the *millimetre* (mm.) and *centimetre* (cm.) are employed in the U. S. Pharmacopœia in the descriptions of drugs, accompanied by the equivalent measure in inches or its fractions, whilst in microscopy, *micromillimetre* (mkm.), signifying the thousandth part of a millimetre, is sometimes used. In measures of capacity, the term *millilitre* is generally replaced by *cubic centimetre* (C.c.) in chemical and pharmaceutical practice, whilst it and the litre are alone chosen as the most convenient units. In weight, the *milligramme*, *centigramme*, *gramme*, and *kilogramme* are selected; the latter being the commercial unit for larger quantities of drugs, and called *kilo*. This habit of appropriating only certain of the most convenient denominations for practical work has an analogy in the disuse of the theoretical terms of the system of United States coinage: thus, the double-eagle, eagle, and dime are ignored, whilst dollars and cents are preferred as

¹ The unit of surface measure, the *are*, being the square of ten metres, and the unit of solid measure, the *stere*, having the capacity of a cubic metre, need not claim the attention of the practical pharmacist.

units. The principal merits of the metric system are: 1. That every weight and measure bears a simple relation to the initial unit, the metre. 2. That every unit is multiplied or divided by the same number (*i.e.*, 10) to obtain the various denominations, and increase or decrease is expressed by simply moving the decimal point. 3. Its almost universal adoption makes it an international system.

FIG. 1.

Metric diagram.

Length.—Metre. One side of the above square measures 1 decimetre; it is graduated into tenths (*centimetres*); and these into tenths (*millimetres*); (the scale beneath shows the comparison with inches): 10 decimetres = 1 METRE = 39.370432 in. (remember three threes, 3 ft., 3 in., 3 eighths).

Capacity.—Litre. A hollow cube having each side of the same size as the square would hold a LITRE = 1000 C.c. = 2.113433 pints.

Weight.—Gramme. The weight of distilled water at 4° C. (39.2° F.) contained in a cube of the size of X ($\frac{1}{1000}$ of a litre) is equal to a GRAMME = 15.43234874 grains, and measures 1 *cubic centimetre*.

The advantages of the metric system have become more and more apparent upon examination, and its simplicity, brevity, and adaptability to every-day needs are now universally conceded. The progress which it had made in this country up to 1890 fully warranted its exclusive adoption in the U. S. Pharmacopœia: hence definite quantities are given and metric weights and measures are alone employed. The necessity for knowing thoroughly the denominations of all the systems in present use is one of the evils common to the age in which we live; and it must ever be a source of regret that when the young Republic, more than a century ago, abolished the complex system of coinage and adopted the decimal system, it did not go a step further and adopt the same principle in weights and measures.

The chief disadvantage of the metric system is one which inheres to the decimal principle of arithmetic,—namely, that the number ten cannot be divided more than once without producing a fraction, as, 10, 5, 2.5, 1.25, 0.625. The practice of dividing five into the three parts of 2, 2, and 1 partly compensates for this defect; and metric weights are constructed on this principle. The use of the metric weights and measures in the text of the U. S. Pharmacopœia makes it necessary for every pharmacist to become familiar with them, and therefore an easy method of remembering their relations to one another and their equivalents in other systems is desirable. The following equivalents are derived from those established by Congress for use in legal proceedings, or are based upon the trustworthy determinations of Captain Clarke and Prof. Miller, whilst the accompanying rules, which show the methods of using the equivalents, are preferred, on account of giving more accurate results. When very fine calculations are unnecessary, it will be found that the tables of equivalents given on pages 44 and 45 will prove sufficiently accurate for most pharmaceutical work.

To convert metric weights or measures into those in ordinary use:

RULE.—Multiply the metric quantities by the corresponding equivalent.

Ex.—The equivalent of *one metre* is 39.370+ inches, and five metres would be 196.85 inches: $39.370 \times 5 = 196.85$. To convert

<i>Metres</i>	into <i>inches</i> ,	multiply by 39.370
<i>Centimetres</i>	“ <i>inches</i> ,	“ 0.3937
<i>Millimetres</i>	“ <i>inches</i> ,	“ 0.03937

As *one litre*, or 1000 C.c., is equal to 33.8149+ fluidounces, or 35.235 Imperial fluidounces, to convert

<i>Litres</i>	into <i>fluidounces</i> ,	multiply by 33.815
<i>Cubic centimetres</i>	“ <i>fluidounces</i> ,	“ 0.0338
<i>Litres</i>	“ <i>pints</i> ,	“ 2.113
<i>Litres</i>	“ <i>Imperial pints</i> ,	“ 1.7617
<i>Litres</i>	“ <i>Imperial gallons</i> ,	“ 0.2202
<i>Cubic centimetres</i>	“ <i>Imperial fluidounces</i> ,	“ 0.0352

As *one gramme* is equal to 15.432+ grains, or .03527 *avoirdupois ounce*, or .03215 *troy ounce*, to convert

<i>Grammes</i>	into <i>grains</i> ,	multiply by 15.432
<i>Centigrammes</i>	" <i>grains</i> ,	" 0.15432
<i>Milligrammes</i>	" <i>grains</i> ,	" 0.01543
<i>Kilogrammes</i>	" <i>avoirdupois ounces</i> ,	" 35.2739
<i>Grammes</i>	" <i>avoirdupois ounces</i> ,	" .03527
<i>Kilogrammes</i>	" <i>avoirdupois pounds</i> ,	" 2.2046
<i>Kilogrammes</i>	" <i>troy ounces</i> ,	" 32.1507
<i>Grammes</i>	" <i>troy ounces</i> ,	" .03215

To convert the weights and measures in ordinary use into metric weights and measures:

RULE.—Multiply the quantities by the corresponding metric equivalent.

As *one inch* is equal to 0.0254 metre, *one fluidounce* to 29.572+ cubic centimetres, *one Imperial fluidounce* to 28.3807 cubic centimetres, *one grain* to 0.0648 gramme, *one avoirdupois ounce* to 28.3495 grammes, and *one troy ounce* to 31.1035 grammes, to convert

<i>Inches</i>	into <i>metres</i> ,	multiply by 0.0254
<i>Inches</i>	" <i>centimetres</i> ,	" 2.5399
<i>Inches</i>	" <i>millimetres</i> ,	" 25.3997
<i>Pints</i>	" <i>litres</i> ,	" 0.4731
<i>Fluidounces</i>	" <i>cubic centimetres</i> ,	" 29.572
<i>Imperial pints</i>	" <i>litres</i> ,	" 0.5676
<i>Imperial gallons</i>	" <i>litres</i> ,	" 4.5409
<i>Imperial fluidounces</i>	" <i>cubic centimetres</i> ,	" 28.3807
<i>Grains</i>	" <i>grammes</i> ,	" 0.0648
<i>Grains</i>	" <i>centigrammes</i> ,	" 6.4799
<i>Grains</i>	" <i>milligrammes</i> ,	" 64.799
<i>Avoirdupois ounces</i>	" <i>kilogrammes</i> ,	" 0.02835
<i>Avoirdupois ounces</i>	" <i>grammes</i> ,	" 28.3495
<i>Avoirdupois pounds</i>	" <i>kilogrammes</i> ,	" 0.4536
<i>Troy ounces</i>	" <i>kilogrammes</i> ,	" 0.0311
<i>Troy ounces</i>	" <i>grammes</i> ,	" 31.1035

It will be observed that there is a slight difference in the smaller quantities, increasing in the larger, between the equivalents in the following tables and those above given: this is owing to the fact that the temperature used as the basis for the metric units is 4° C., instead of 15.6° C., the usual temperature in practice, and the equivalents in the old form weights and measures in the table must correspond. The column upon the left of the page gives the weight in grains from one hundred pounds down; the difference in value from the next column is due to the variation in temperature standards: the fluidounce equivalent at 15.6° C. (60° F.) is 455.7 grains; the fluidounce at 4° C. (39.2° F.) in vacuo is 456.392 grains. For practical work in pharmacy the discrepancy is too trivial to give serious annoyance.

TABLE OF METRIC AND OLD FORM EQUIVALENT WEIGHTS AND MEASURES.

ORTHOGRAPHY, PRONUNCIATION, AND READING.

Orthography.—There are two methods of orthography of the metric units in use in the United States: in one of these, the original French, the units are spelled *metre*, *litre*, *gramme*; in the other, proposed by the American Metric Bureau, the units are spelled *meter*, *liter*, *gram*. It would not be appropriate in a treatise of this kind to discuss the merits of either plan, but it is unfortunate that in the U. S. Pharmacopœia of 1890 the question was not settled, the French *gramme* having been retained and *meter* and *liter* adopted. As this compromise can only lead to confusion, the original orthography is preferred in this work, and it is used with one exception,—i.e., *deca*, which is changed to *deku*, because *deca* could easily be mistaken for *deci*. In pharmacy particularly, *gramme* is to be preferred to *gram*, because in writing *gram* it could easily be mistaken for *grain*, particularly if the *i* in *grain* were not dotted.

Pronunciation.—*Metre* is pronounced mee'ter, *litre* lee'ter, *gramme* gram, not, as sometimes heard, gram'mee; centimetre should be pronounced sen'tee-mee-ter, not son'tee-mee-ter. The latter faulty pronunciation is quite common, and is due to confounding the French pronunciation with the English. Either son-tee-mā'tr (French) or sen'tee-mee-ter (English) would be correct, but to use half of the French and half of the English is obviously improper, and, as the metric system is now anglicized, the simple English pronunciation is less stilted and more appropriate.

Reading.—Some difficulty is usually experienced by those unfamiliar with the metric system in reading the quantities. In the linear measures in Pharmacy centimetres and millimetres are almost exclusively used: now, 0.05 m. would not be read five hundredths of a metre, but 5 centimetres (5 cm.); if the millimetre column contains a unit, as in 0.055 m., it is read fifty-five millimetres (55 mm.), in preference to fifty-five thousandths of a metre; or it is sometimes read five centimetres and five millimetres.

Fractions of a millimetre must be read decimally, as, 0.0555 m., fifty-five and five-tenths millimetres. In measures of capacity, cubic centimetres are exclusively used; if the quantity is less than a litre, the terms half litre, quarter litre, decilitre, centilitre, millilitre, are replaced by 500 C.c., 250 C.c., 100 C.c., 10 C.c., 1 C.c.; in aqueous liquids the cubic centimetre is considered equivalent to a gramme. In weight, when the quantity is relatively large, and in commercial transactions, the kilogramme is abbreviated to kilo, pronounced kīl'ō; when less than a kilogramme, and not less than a gramme, the quantity is read with the gramme for the unit; 2000 Gm. would be read two kilos, and 543 Gm. would be read five hundred and forty-three grammes, whilst 2543 Gm. is usually read two kilos and five hundred and forty-three grammes, although twenty-five hundred and forty-three grammes is sometimes preferred. For quantities below the gramme, decigrammes are not used, but centigrammes and milligrammes are regarded as the most convenient units: they are read in the same way as centimetres and millimetres.

Weighing and Measuring.

Among the first operations that the student is called upon to perform are the very important ones of *weighing* and *measuring*. The former process requires the use of the *balance*, or, as more frequently, but less preferably, termed, *scales*. As the successful performance of many of the processes noticed in this work depends upon a thorough knowledge of the principles of the balance, it has been selected as one of the first subjects for consideration, for this instrument in some form or other is relied upon to secure accurate quantities of the substances employed in the various operations of pharmacy.

The balance may be defined as an instrument for determining the relative weights of substances, and should be *correctly constructed, skilfully used, and carefully protected from injury*, if accurate results are expected.

CONSTRUCTION OF THE BALANCE.—For systematic consideration pharmaceutical balances may be classified as follows: 1. *Single beam, equal arms*. 2. *Single beam, unequal arms*. 3. *Double beam, unequal arms*. 4. *Compound lever balances*. 5. *Torsion balances*.

1. **Single Beam, Equal Arm Balances.**—The instrument which, notwithstanding many attempts to supplant it, still maintains its supremacy is the *single beam, equal arm balance*, which may be described as consisting of a metallic lever or beam, divided into two equal arms at the centre by a knife-edge, upon which it is supported. At exactly equal distances from this point of support, and situated in the same plane, are placed the end knife-edges: these suspend the pans which carry the substances to be weighed. A good balance should possess the following requirements:

1. *When the beam is in a horizontal position, the centre of gravity should be slightly below the point of support, or central knife-edge, and perpendicular to it.*

The relative sensibility of the balance depends upon the fulfilment of this principle, which may be roughly illustrated by forcing a pin through the centre of an oblong piece of pasteboard: if the edge of the pasteboard is touched slightly it does not oscillate at all, but revolves around the centre to a degree corresponding to the impulse representing equilibrium; if the pin be removed and inserted a very short distance above the centre, and the edge of the pasteboard touched as before, it will oscillate slowly, corresponding to a sensitive beam, the point of support being slightly above the centre of gravity; if the pin be again removed and inserted far above the centre, and the same impulse imparted to the edge, it will oscillate quickly, illustrating stable equilibrium and a beam which comes to rest quickly and is not sensitive. A more elaborate method of illustration is furnished by the use of a beam with a movable fulcrum (see Fig. 2), when the relative position of the knife-edge may be made to show, beginning at the top, 1, stable equilibrium; 2, in the centre, equilibrium; and, 3, when the lowest point is reached, unstable equilibrium, and then the slightest impulse upsets the beam.

2. *The end knife-edges must be at exactly equal distances from the*

central knife-edge; they must all be in the same plane, and the edges absolutely parallel to each other.

It is very apparent that the conditions of a good prescription balance cannot be satisfied if there is inequality in the length of the arms of the

Illustration of equilibrium.

beam. In Fig. 3, BA should equal AC, otherwise unequal weights would be required to establish equilibrium, or the excess of weight of the longer arm must be subtracted at every weighing, or weighing by substitution resorted to, all manifestly impracticable. If the central knife-edge be placed either above or below a line drawn so that it connects the end knife-edges, the loading of the pans will either cause the beam to

Position of knife-edges.

cease oscillating, or diminish the sensibility in proportion to the load. If the knife-edges are not parallel, the weight of a body would not be constant upon every part of the pan, but would be greater if placed near the edge on one side, and correspondingly less at a point directly opposite.

3. *The beam should be inflexible, but as light in weight as possible, and the knife-edges in fine balances should bear upon agate planes.*

Rigidity of the beam is necessary, because any serious deflection caused by a loading of the pans would lower the end knife-edges, and thus accuracy in weighing would be impossible. The beam should not be heavier than necessary, because its sensibility (particularly when light weights were placed upon the pans) would be thereby lessened, and to diminish friction arising from the rusting of the steel knife-edges which constantly increases with the age and use of a balance, the bearings of the knife-edges should be agate planes. Formerly this condition could not be practically carried out, except in expensive balances, owing to the cost of polished agate; but since the introduction of automatic machines for grinding and polishing this very hard substance, the cost has been so reduced that not only the bearings, but the knife-edges themselves, are now made of agate and used upon fine prescription balances, and it is practical economy to employ exclusively those so mounted.

The Tests of a Balance.—Having stated the essential points in the construction of the balance, the tests, which should always be applied before accepting a balance, will now be described. The prescription balance, being one of the most delicate and important of the instruments

in use by the pharmacist, is selected for illustration. 1. A perfectly level counter or table is secured, the balance is placed in position, the beam elevated so that it is free to oscillate, and when the oscillations have ceased, the smallest weight to which the balance is sensitive is placed upon the right-hand pan,—it should at once respond to the weight; this tests its sensibility with unloaded pans. 2. Both pans are now loaded with the full weight that the balance is designed to carry, and then the smallest weight is placed upon the right-hand pan,—the oscillation, although slower than in the first test, ought to be as decided; this shows its sensibility when loaded. 3. The pans should now be loaded to half the capacity of the balance, and equilibrium perfected by adding, if necessary, a piece of tin-foil. The weights on the right-hand pan must now be exchanged for those on the left-hand pan, and *vice versa*; if equilibrium is still maintained, *the arms of the beam are equal*. 4. The pans should be moderately loaded and balanced, and one of the larger weights shifted in different positions upon the edge of one of the pans, and any variation in equilibrium carefully noted. This variation, as previously mentioned, indicates a want of parallelism in the knife-edges.

Forms of Single Beam, Equal Arm Balances.—There are good reasons for believing that this kind of balance has a very ancient origin; and at the present time it is used more frequently than any other.

Hand Scales.—The commonest form in which this principle is utilized in pharmacy is seen in the cheap hand scales now fast passing out of use; in the better qualities the beam is of steel, and the knife-edges are enclosed so as to protect them from injury. In those usually seen the

FIG. 4.

Manner of holding scales.

beam is of brass, with a steel central knife-edge, having a perforation in each end of the beam for the insertion of two wire hooks, to which are attached silken cords for supporting the pans. The manner of holding these scales is shown in Fig. 4. They are now most largely employed in

America by physicians and pharmacists having a very limited use for a balance. The silken tassel is held in the left hand, and care should always be taken to *see that the beam oscillates freely and properly* before the weight is placed upon the left-hand pan, as the hooks frequently become entangled in the cords and the adjustment is lost. The requisite quantity of the substance to be weighed is placed upon the right-hand pan, preferably with a spatula.

Alkaloids and very poisonous substances should never be weighed upon ordinary hand prescription scales, except when, by previous actual test at the time, they have been shown to be sensitive and accurate; for, although this form has been in use many years, as now found in commerce they are the most unreliable of all kinds of prescription balances, and, notwithstanding their merits of cheapness and portability, in the end they may prove (through some serious error) an expensive investment. In Fig. 5 is shown an improved form of hand scale in which a sliding weight is used; this may be suspended on a hook at the proper height as shown in the cut.

FIG. 5.

Hand scale with sliding weight.

Prescription Balances.—The advantage of substituting a rigid metallic column for the usually unsteady human arm, as a support to the beam, would seem to be apparent at a glance, for, in addition to the increased stability which is gained, both hands are left free to perform the weighing; more time can usually be devoted to secure equilibrium, and the oscillations can be more readily noticed.

A cheap form of prescription balance, called, technically, the army prescription scales (Troemner), is seen in Fig. 6; the beam, column, supports, pan, etc., are of brass, the knife-edges of steel, whilst the

drawer beneath is large enough to hold conveniently all the parts; this is a very useful feature where a balance is not in constant use, enabling the operator to set the balance at will, or keep it in the drawer protected from dust and corrosion. It may be made sensitive to the $\frac{1}{4}$ of a grain; but it soon loses this degree of delicacy, because of the rusting of the steel bearings and knife-edges. With careful handling, and by protecting it from the atmosphere by covering with a glass shade, it will remain in good order for years, and is vastly superior to the hand prescription scales.

FIG. 6.

Army prescription scale.

A pharmacist who desires to make use of all the modern improvements and secure the best practical results, should have, for *economy's* sake, *two* prescription balances,—one for delicate weighings and the other for ordinary work. These need not have the most fashionable and costly *cases*, but the workmanship of the balance itself cannot be too fine, if by it are secured the absolute essentials of accuracy, sensibility, and durability.

In addition to the theoretical requirements before noted, the finest prescription balances now made by Troemner are provided with solid silver pans and gold-plated beams (see Fig. 7). As the pans are subjected to more wear and tear than any other part of the balance, it is economical

FIG. 7.

Fine prescription balance.

to use *solid* rather than *plated* pans, for, as they have to be cleaned repeatedly, constant friction wears off the plating, and the additional cost for replating soon absorbs the difference in price. To secure the best results, when a showy appearance is not desired, a dead-black finish to the column is preferable, as the labor of polishing, with the danger to the adjustment that it involves, is dispensed with. If the supports and pans are of solid silver or nickel, and the knife-edges and the bearings of agate, a prescrip-

tion balance is furnished which is durable and really cheap, because it is fully equal to the most exacting demands.

Analytical Balances.—The growing importance of analytical work, in connection with the quantitative tests introduced into the last revision of the U. S. Pharmacopœia, renders the possession of an analytical balance by the pharmacist very desirable. Formerly these delicate objects of mechanical skill were exclusively imported, but for twenty years American manufacturers have devoted unremitting effort to excelling in this fine work, with gratifying success. Fig. 8 shows an analytical balance of recent pattern. The open, metallic beam is made of

aluminum, the bearings and knives of agate, the pans and hangings of aluminum, all other parts being plated with gold. The ends of the stirrups are provided with hooks to suspend a body in taking its specific gravity, and a contrivance for arresting the motion of the beam and pans, together with one for elevating the beam entirely from contact with the agate planes when not in use, is provided.

Fig. 9 shows an enlarged view of the end of the beam with the beam locked; the dotted lines show the position of the lever when the beam is permitted to oscillate. The right arm of the beam is graduated so that each division represents one-tenth of a

milligramme if metric weights are used, or one-hundredth of a grain if apothecaries' weight is employed; an aluminum-wire rider is pushed along the arm by a sliding rod to any point upon the graduated beam to indicate these fractions. An index needle traverses an ivory scale fixed on the base of the column, and the most delicate oscillations may be thus measured by the needle: if, for instance, *one-tenth of a grain* on one of the pans deflects the needle *ten* divisions on the scale, each one of these divisions would then represent one-tenth of the weight on the pan, or one-hundredth of a grain. With practice, the use of this means of weighing very minute quantities can be brought to great perfection.

Counter Scales.—For counter and dispensing purposes, the single beam, equal arm principle was formerly exclusively used (see Fig. 10). These scales were usually made of polished brass, and answered most purposes if kept in good order, but were objectionable because the pan-supports were frequently obstructive, as they only permitted the weighing of bodies having a limited surface, and the excessive amount of polished brass-work about them required the expenditure of considerable labor to keep them bright, without any corresponding advantage. The form in which the pans are placed above the beam, thus getting rid of obstructive

FIG. 8.

Analytical balance.

FIG. 9.

End of the beam of analytical balance.

pan-supports, is now greatly preferred. A cheap form is seen in Fig. 11. In these the objection to the polished brass is met by japanning the beam and weight-pan to protect them from rust; the copper or

brass pan alone needs polishing, but the knife-edges and bearings require careful cleaning from time to time if their original sensitiveness is to be even approximately retained. A very convenient form of dispensing scale for smaller weights, made by Troemner, is shown in Fig. 12. This beam is provided with a parallel, graduated, nickel-plated bar, upon which a poise slides backward and forward; this is particularly useful for weighing liquids. The tare of the bottle is easily taken by the use of the sliding poise, the beam is graduated so that apothecaries' or metric weight may be used, and a projecting

FIG. 10.

Old-style counter scales.

shelf attached to the base forms a convenient receptacle for the weights.

FIG. 11.

Common counter scales.

FIG. 12.

Scale with graduated parallel beam and sliding weight.

2. Forms of Single Beam, Unequal Arm Balances.—The principle upon which these very practical weighing machines are founded is best shown by referring to Fairbanks's druggists' scale (see Fig. 13), and quoting the law in physics, "*The power is to the weight or resistance in the inverse ratio of the length of the arms of the lever.*" The inequality in the length of the arms of this beam permits of the convenient use of one movable weight upon the graduated longer arm of the beam, and thus dispensing with the use of small weights, which are liable to be lost; the scoop, which is useful in weighing bulky drugs, is sometimes replaced by a flat, circular disk when bottles, etc., are to be weighed.

The principle of the graduated beam has been utilized by Fairbanks to make a very simple and convenient prescription scale, by the use of which detached weights are dispensed with (see Fig. 14). A nickel-

plated beam is suspended nearly in the centre, at one end of which a pan-support is attached, carrying a nickel-plated pan; the arm of the

FIG. 13.

Fairbanks's druggists' scale.

beam nearest to the pan is graduated into thirty divisions and marked *grains*; a small sliding weight is used upon this arm; the other arm is graduated only about half its length, and the divisions represent *drachms*. A heavier sliding weight is used here to indicate drachms,

FIG. 14.

Graduated beam prescription scale.

and at the other end of the arm there is attached a weight, which is fastened to the beam by adjusting screws; this may be moved backward

or forward and set, and is for the purpose of maintaining equilibrium in case the beam should need rebalancing at any time; the end of this arm moves freely up and down in the wire loop on the upright at the end of the base. This scale is not intended for very accurate weighing, but it serves the purpose of relieving a delicate balance of a good deal of heavy wear and tear; it will, if kept in order, weigh as little as half a grain.

A very simple vest-pocket prescription scale is made by Shepard & Dudley, of New York; it is on the unequal arm principle, and is shown *full size* in Fig. 15. The principal parts are made in three pieces; the pan is detachable, the pan-support being suspended on the short rod attached to the base; the graduated beam is more than double the length

FIG. 15.

Vest-pocket prescription scale.

of the pan-support, a slot running nearly the length of this beam, and a sliding weight is pushed along in the slot. The scale is very cheap, and is intended for country physicians, who are often compelled to weigh medicines at the bedside of the patient.

3. Double Beam, Unequal Arm Balances.—It is preferable to have a double beam scale for constant use in the laboratory, and the most convenient form is upon the same principle as Fairbanks's druggists' scale (Fig. 13), having, however, two parallel beams. This scale is particularly adapted for weighing liquids, the weight on the outside beam being used to tare the bottle or jar, whilst the other weight is left free so that it can be adjusted at once to the weight of the liquid desired. These are now to be had with the scale graduated into grammes, and are very useful in making preparations by the metric system, no loose weights being required when moderate quantities are to be weighed. (See Fig. 16.)

4. Compound Lever Balances.—The principle of the compound lever was first applied in the construction of balances by Robervahl, of Paris, about A.D. 1660. It has only been recently adopted for delicate weighings in compounding prescriptions, although the general utility of counter and platform scales constructed upon this plan has long been recognized. The principal objection to them, when compared with equal beam balances, consists in the multiplicity of points of suspension, thus necessarily increasing friction and the liability to disarrangement; but their general convenience, and some recent improvements in their construction, have brought them into favor. The principle of the Robervahl compound lever balance, with the arrangement of the levers, is shown in Troemner's glass box scale in Fig. 17.

One of the practical advantages possessed by this form of balance is the small amount of polished metal to keep in order, and, as the working parts are enclosed in a tight box of glass, wood, or marble, dust and corrosive vapors are largely excluded; as they are made to occupy as little space as possible, the pans are conveniently low and unobstructed.

Box prescription scales, on the compound lever principle, have come into extensive use, and they are the most convenient scales for weighing moderately small quantities (see Fig. 18). Although sensitive to $\frac{1}{10}$ of a grain when new, they do not retain this delicacy long. Their strongest recommendation is the ease with which they may be cleaned and kept in order; the only polished metal liable to be affected by corrosive vapors is found in the pans, and these are nickel-plated; the marble top has

FIG. 16.

Troemner's scale for weighing liquids.

FIG. 17.

Compound lever balance in glass box.

a countersunk basin to keep weights in, and a hinged glass cover effectually excludes dust and vapors when the balance is not in use. If a pharmacist has a delicate, equal-beam balance for weighing alkaloids and powerful poisons (see Fig 7), and a box pre-

scription scale for weighing ordinary quantities, he is well equipped for compounding prescriptions.

By far the most extensive application of the compound lever and unequal arm principles has been made in the universally known platform scales, which are manufactured largely by Fairbanks and others; these are employed in weighing comparatively large quantities, and are most useful in the laboratory and warehouse. In these a platform or table is suspended by four short legs upon the ends of four levers, which are joined to a central nearly horizontal lever, which in turn is connected with a perpendicular iron rod attached to the graduated bar, suspended so that one of the arms is much longer than the other. This combination of levers is so nicely adjusted that one hundred pounds placed upon the platform may be balanced by a one-pound weight placed upon the end of the graduated bar.

FIG. 18.

Box prescription scale.

Torsion Balances.—A simple illustration of the principle of torsion is afforded by tying a stout piece of cord to a firm support and inserting a lead-pencil in the middle of the cord between the strands, at right angles to it. If the free end of the cord is tightly stretched, and the effort is made to turn the lead-pencil over, it will be at once noticed that resistance is offered, and if the pencil is released, it at once flies back to its original position.

Torsion is the term applied to this method of twisting. The principle of supporting the beam of a balance upon a tightly-stretched wire, with the view of doing away with knife-edges and diminishing friction, has occupied the attention of inventors for years. One of the earliest and simplest forms in which this principle was used was that devised by Ritchie, shown in Fig. 19. A very light beam is supported exactly in the middle (at its centre of gravity) upon a wire stretched upon a horizontal bar, having its ends slightly turned up; to these the ends of the wire are fastened, the beam is firmly secured to the wire, and when it is caused to oscillate the wire is twisted according to the extent of the force applied. This balance was very delicate and impracticable, because the torsional resistance was not overcome; this had to be neutralized before the wire could be used solely as a means of supporting the beam. In 1882, Prof. Roeder and Dr. Springer contrived an ingenious torsion balance which gave promise of valuable results. Two illustrations of this original balance are shown on page 54 of the first edition of the "Practice of Pharmacy." Recent improvements have greatly increased its efficiency; the most important difficulty in applying the principle—that of torsional resistance—was overcome by the device of placing a weight just above the centre of gravity, torsional resistance having the tendency to keep the beam in a horizontal position, whilst the elevation of a weight above the centre of gravity, by its tendency to produce unstable equilibrium, see page 54, exercises an opposite effect,—that of inclining the beam to be top-heavy, and therefore to tip on either side. If now the weight be made adjustable,

FIG. 19.

Ritchie torsion balance.

FIG. 22.

Torsion prescription balance.

FIG. 20.

Frame.

FIG. 21.

Frame with wire.

by mounting it upon a perpendicular screw, so that it can be raised or lowered, it is possible to arrange these opposite forces so that one exactly neutralizes the other. In this manner sensitiveness is obtained.

In the torsion prescription balance (see Fig. 22) two beams are used, supported upon three frames, each of the latter having a flattened

metallic band stretched tightly over its edge. Fig. 20 shows one of these frames, and Fig. 21 shows a frame with the wire stretched upon it.

FIG. 23.

Part of the rider beam.

edge from .5 centigramme to 5 decigrammes (see Fig. 23) furnishes a very convenient means of weighing minute quantities without having

FIG. 24.

Torsion counter scale.

to use the small weights. The form of the prescription balance is that of the box scale, enclosed in a glass case, a rider beam graduated upon the upper edge from $\frac{1}{8}$ of a grain to 8 grains and on its lower

upon the scale-pans to receive a substance to be weighed. (See Fig. 24.)

The torsion principle has also been applied to analytical balances with short arms and scales designed to carry heavier loads, as well as counter scales constructed upon the compound lever principle; balances with unequal beams and those having sliding weights upon graduated beams are now manufactured in many different patterns.

Care of the Balance.—The necessity for protecting the delicate mechanism of a balance is frequently overlooked, notwithstanding the possibility of having a fine apparatus irretrievably ruined by want of care in using or cleaning it or in protecting it whilst at rest. The position chosen for the balance or scales should be upon a level and firm counter, desk, or table, where it will be subjected to little risk of injury from dampness, dust, or corrosive vapors, and where the knife-edges will not be liable to become blunted by the jarring produced by heavy mortar-practice or other vibration.

In the finer class of balances protection is afforded by enclosing them in glass cases having sash doors in the front or at the side, and providing against injury from vibration by the use of a lever for elevating or locking the beam, so that the knife-edges are not in contact with any surface whatever. To prevent injury from jarring whilst the balance is in use, by a weight falling on the pan or other accident, the finest balances are provided with pan-supports, which break the fall and serve the additional purpose of quickly arresting the beam, thus saving time whilst weighing.

Substances which act on metals, like iodine, corrosive sublimate, etc., and those which are adhesive, like the extracts, should not be weighed directly upon the scale-pans, but upon the glass pans which are furnished

by the manufacturers, or, if these are not at hand, upon highly-glazed paper, care being taken to balance the papers before weighing the substance. In cleaning the scales, great care should be exercised; polishing powders should be used sparingly; a portion is very apt to find its way into crevices and elude detection until an attempt is made to adjust the scales, when the increased weight of one of the sides of the beam leads to its discovery. Frequent cleaning with soft leather is generally sufficient to keep a balance in good order; but if through neglect it becomes necessary to use more active measures, some simple polishing powder for the silver and brass work, with soapsuds for nickel-plate, and simple brushing for the lacquered brass, is all that is necessary.

METALLIC WEIGHTS USED IN PHARMACY.

The weights used by the pharmacist are a very important part of his outfit, and care in their selection and examination is necessary: economy of the cheese-paring order is particularly to be avoided, as the use of cheap, inaccurate weights must lead ultimately to serious consequences.

Common avoirdupois weights are usually made of iron, and are of the flat, circular form (see Fig. 25), japanned to prevent rusting; these form a pyramidal pile, and range from half an ounce to four pounds; they may be adjusted by adding to or diminishing the amount of lead which is hammered into a depression in the base of each.

These weights are sometimes made of brass in this form, and sometimes of zinc: the latter, however, are brittle and unserviceable. When used for dispensing purposes, the cylindrical weights, known technically as "block weights," are preferable. If the block is made of two kinds of wood glued together, so as to avoid shrinkage, they are very desirable, particularly if each cylindrical hole in the block has been made large enough to hold easily each weight. The advantages of block weights are, that the gaps left by missing weights are readily noticed, and the greater surface of the weight is protected from the action of corrosive vapors when not in use. When the weights are nickel-plated, a more imposing appearance is produced by arranging them on an ebonized block in recesses. The disadvantage of this form is that the surfaces are not protected from oxidation, and they need cleaning more frequently. J. M. Maris & Co., of Philadelphia, supply brass avoirdupois weights having a shoulder near the top; these fit into circular openings in a hollow cast-iron frame (see Fig. 26), and by this expedient the annoyance common to ordinary blocks, caused by the shrinkage of the wood, is avoided.

FIG. 25.

Common avoirdupois weights.

FIG. 26.

Avoirdupois weights in metal frame.

Troy weights may be had either as "block weights" or "cup weights;" the latter are to be preferred, particularly if the block avoirdupois weights have already been procured, for they are then easily distinguished from each other. The cup troy weights range from quarter of an ounce to thirty-two ounces, and have many conveniences (see Fig. 27). When the outside weight is separated, it will be found to have the exact weight of all the rest; if one of the weights is missing, its absence is at once noticed in the incomplete nest; and their compact form is a great recommendation. Weights cannot well be made to occupy less space; whilst all the inside weights are protected from abrasion and corrosion.

FIG. 27.

Troy weights.

Metric weights may be procured of iron (japanned) for coarse weighing, when they are preferably hexagonal and flat in shape, to distinguish them from the ordinary round avoirdupois weights (see Fig. 28). The most useful for the pharmacist's purposes are undoubtedly the brass weights. Those made by Becker, and contained in a solid block, ranging from one centigramme to one hectogramme, as shown in Fig. 29, are very reliable and convenient.

FIG. 28.

Metric weights (iron).

For prescription purposes, a very inexpensive yet accurate set is made by Troemner, by which as high as forty grammes may be weighed by using all the brass weights, whilst ample provision is made for weighing the fractional parts of a gramme.

For analytical purposes, metric weights are almost exclusively used; in the most complete sets the highest weight is one kilogramme, the lowest one-tenth of a milligramme; three riders for use on the graduated scale beam are

provided. The weights from one gramme upward are of brass, finely lacquered; the smaller weights are made of squares of platinum-foil, curved so as to permit of being easily handled with the forceps (see Fig. 30).

Prescription Weights.—Too much care can hardly be exercised in the selection of weights to be used in compounding prescriptions. The cost of accurate weights is trifling, yet the market is flooded with weights which are disgracefully inaccurate, and it is greatly to be regretted that the latter find a ready sale. The round, flat, brass "drachm" weights, which have the denomination stamped distinctly on their face in raised characters, are most largely used: these range from ten grains to one hundred and twenty grains in weight. The old-fashioned square brass "drachm" weights are rapidly passing out of use. The brass-foil grain weights are usually inaccurate, and should not be employed, because of their liability to corrosion. Undoubtedly the best grain weights are the aluminium wire weights: these are more easily and quickly distinguished

from one another than any other form, and there is less likelihood of dangerous mistakes than from the flat weights, where the denomination is stamped upon the face, often faintly, and is liable to be obliterated

FIG. 29.

Metric weights (block).

by constant use or corrosive contact. The number of sides in the wire weights at once gives the denomination (see Fig. 31). There is such a

FIG. 30.

Metric weights (analytical).

FIG. 31.

Aluminum wire weights.

difference in the shape of these weights, and they are so simply handled practically, that they should be invariably used. The aluminum grain weights, cut out of aluminum plates, are to be preferred to the flat, brass grain weights, because less liable to corrosive action. They are usually more accurately adjusted; the corners of the weights are clipped, and each weight is pressed into a curved form, so that it may be easily picked up (see Fig. 32).

FIG. 32.

Aluminum grain weights.

Measuring Liquids.—Tinned iron measures nearly cylindrical in shape, but slightly wider at the bottom, are generally used for measuring liquids when the quantity is over a pint. A set of these measures usually consists of four (gallon, half-gallon, quart, and pint). Those made of tinned iron, or of the enamelled sheet-iron called agate or marbleized, are greatly inferior to those made of *tinned copper*. Tinned iron measures

soon become rusty ; and although a protection is afforded if enamelled, particles of the enamel become chipped off; and the exposed iron soon contaminates the liquids measured in them. Tinned copper measures cost more at first, but they are more economical, because more durable. Care must be taken to protect them from blows which will cause dents, as these may be serious enough to detract from the accuracy of the measures. Fig. 33 shows a useful combination of a measure and funnel. Cylindrical metric measures having a diameter just half their height, of tinned copper or brass, in sets of ten, including dekalitre, half-dekalitre, double litre, litre, half-litre, double decilitre, decilitre, half-decilitre, double centilitre, and centilitre, are furnished by the American Metric Bureau. An excellent measure for the laboratory, particularly where liquids are to be carried any distance, is shown in Fig. 34. It is used by Dr. E. R. Squibb, and has the merit of being less liable to error

FIG. 33.

Combined measure and funnel.

FIG. 34.

Laboratory measure.

in measuring than those of ordinary shape, because of the contracted surface at the top.

Glass measures are preferred for relatively small quantities of liquids, for, although always subject to loss by fracture, they can be more accurately adjusted to indicate the measure. On account of the transparency of glass, the level of the liquid at any height may be seen through the measure, whilst porcelain or metallic measures have to be full, or nearly so, to be used.

Glass graduated measures are almost exclusively used for quantities of one pint or less, and these are of two forms,—*conical* and *cylindrical*. The conical graduate is preferred in practical work because of the greater ease with which it can be cleansed, but cylindrical measures are likely to be more accurate because of their smaller diameter : thus, if a conical graduated measure has at the f 33 mark a diameter of 3 inches (see Figs. 35 and 36), and the cylindrical graduate a diameter at the same mark of 1 inch, it follows that a trifling error in reading off in the cylindrical graduate, either slightly above or below the line, would be increased if similarly made in the conical graduate by exactly the number of times that the surface of the conical graduate exceeds that of the cylindrical

graduate at the given point (see Fig. 37). Formerly it was usual to use exclusively glass measures which had been graduated by hand; but, owing to the large quantities of imperfect graduates found in the

FIG. 35.

Tumbler-shaped graduate.

FIG. 36.

Metric graduate.

FIG. 37.

Cylindrical graduate.

market, moulded measures came into use: these, whilst deficient in the attractive brilliancy of surface characteristic of blown glass, have the substantial merit of greater accuracy. Hodgson's moulded graduated measures were the first to appear, and were largely used for a while, but they have been supplanted by Hobb's graduated measures. In Hodgson's measure the graduations are upon the outside surface of the glass, and their accuracy largely depends upon whether the plunger, which forces the melted glass into the mould, is driven down to exactly the standard depth to secure the proper thickness of glass to indicate the correct capacity: this practical point could not always be attained, owing to the wear of the mould, and occasionally the measures were imperfect. In Hobb's graduated measures this difficulty is overcome by *graduating the plunger*, and when this is done it makes no difference about the thickness of the glass, because if the plunger is correctly graduated, if the proper allowance has been made for contraction in cooling, and if a correct impression can be made upon the inside of the glass, the measure itself must be accurate, and the same result can be indefinitely repeated. An objection arises, however, to this form of graduate in measuring thick or dark-colored liquids, for then the graduations upon the inside are often completely obscured: this is sometimes remedied by correspondingly marking them upon the outside with an engraver's wheel. The introduction of the moulded graduates has had the natural effect of improving the accuracy of the blown, hand-graduated measures, and it is now unusual to see a measure like one formerly in the possession of the author, which registered 25 per cent. too much when filled to the highest graduation. If the custom of returning to the maker all graduates which prove inaccurate were universal, it would soon be impossible to find an inaccurate one: as it is, reliable graduates can always be had by paying a fair price for them.

An improvement has been made recently by graduating measures *doubly*; upon one side metric measures are marked, and upon the other ordinary fluid measures, and in addition they sometimes have two lips opposite to each other, for pouring either to the right or left, or for permitting the use of either scale. The testing of the graduation of a glass measure is effected most accurately by placing it upon a perfectly level surface and then pouring into it the proper weight of distilled water at the temperature of 15.6 C. (60° F.); the fluidounce, weighing 455.7 grains, is preferably taken as the basis. A sufficiently accurate and more ready method is to measure into the graduate from a standard burette or pipette 30 C.c. of water for a fluidounce (29.57 C.c. is the exact equivalent). The extension of the graduating mark into a circle which passes entirely around the graduate is an improvement which obviates the necessity of placing the graduate upon a level place, as the corresponding mark upon the opposite side may be seen through the glass, and the graduate easily levelled even when held in the hand. For measuring smaller quantities of liquids graduated glass tubes of much less diameter should be used, and minim pipettes are more accurate, cleanly, and convenient than the conical minim graduates which are often used, and which possess several radical faults. By referring to Fig. 38 it will be seen that the graduations on the minim measure are necessarily

FIG. 38.

Minim measure.

in the narrowest and lowest portion of a comparatively tall measure: now, if it is desired to measure ten minims of a volatile oil, to add to a pill mass, the surface which the oil must traverse when this measure is inverted over the mortar is so great that probably 20 per cent. of the oil will be left adhering to the measure. In those instances of liquid preparations where the smaller liquid is miscible with the larger quantity of diluting liquid, the minim graduate may be rinsed and this loss recovered, but inconveniences are largely overcome and greater accuracy secured by the use of the minim pipette suggested by Dr. E. R. Squibb (see Fig. 39). This in its simplest form consists of a glass tube of small calibre, with its lower extremity somewhat contracted, and having minim graduations upon its side. The pipette is used by dipping the contracted end into the liquid to be measured, and upon applying suction by the mouth at the opposite end the liquid is drawn into the pipette; the moistened tip of the right forefinger is now tightly applied to the upper end of the tube to regulate the flow of the liquid, and a sufficient quantity is allowed to flow out by slightly raising the finger until the height of the liquid corresponds to the measure desired; pressure with the forefinger at once stops the flow, and the accurately measured quantity can be transferred to the bottle, mortar, or graduate by raising the finger and allowing the liquid to flow out. These pipettes may be had of four different capacities, holding 15, 20, 30, and 60 minims, and a reference to the cut will show that a sufficient length of tube above the graduations is left to secure the operator from any risk of getting a poisonous liquid into the mouth, except through extraordinary carelessness. One of the best methods of keeping the pipette ready for use is to have it pass

through a perforated cork which fits into a half-pint bottle containing alcohol or water (see Fig. 40), the liquid being renewed when it ceases to be clean. A rubber unperforated tube-nipple, inserted on the top

FIG. 39.

Minim
pipette.

of the pipette, has also been suggested to obviate the necessity of using suction with the mouth; it is used by first pushing it down over the top of the pipette until it will go no farther, then compressing the bulb and inserting the tip of the pipette into the fluid, when upon gradually relieving the pressure on the bulb the pipette commences to fill, and if not filled to the mark desired the bulb is pushed upward gently until the end is attained. In the use of tubes or glass measures of small diameter, it will be noticed that two distinct lines are visible on the surface of the liquid. This is due to the capillary attraction of the glass, which causes the edge of the liquid to creep up the sides, and the surface becomes concave and a *meniscus* is formed; the lowest point of the lower zone is usually selected by analytical chemists as the reading point, but it is manifest that a line drawn between the upper and lower zones slightly below the middle would give the most correct reading. Fortunately, the occasions are very rare in pharmaceutical operations where a difference in the method of reading need cause concern.

In administering small quantities of liquids the very convenient *drop* is almost always used. The impression that a drop is equivalent to a minim, and that sixty drops of any fluid are equivalent to a fluidrachm, is wide-spread. This impression doubtless arose from the fact that sixty ordinary drops of *water* are about equal to a fluidrachm; but many circumstances cause variations in the relative size of drops. Thick viscous liquids, like the mucilages and the syrups, necessarily produce large drops, because the drop adheres to the surface of the glass so long as its weight does not overcome its power of adhesion, whilst bromine and chloroform, heavy, mobile liquids, having very little adhesion to the dropping surface, produce very small drops, only one-fifth the size of the drop of syrup of acacia. The shape and surface of the vessel from which the liquid is dropped also have an influence in determining the size of the drop: the greater the extent of surface for the drop to adhere to, the larger, proportionally, will be the drop. In order that this subject should have an investigation of a rather wide range, the late Stephen L. Talbot, at the author's suggestion, constructed, after many laborious trials, the following table:

FIG. 40.

Minim pipette with
bottle.

SPECIFIC GRAVITY.

A knowledge of the subject of specific gravity is necessary to the pharmacist, to enable him to identify substances or to judge of their purity, whilst the physician frequently depends upon it as an aid in diagnosing certain diseases. *Specific gravity is the weight of one body compared with the weight of an equal bulk or volume of another body selected as the standard, both bodies having the same temperature.* In ascertaining the ordinary weight of a body it is simply compared with an arbitrary standard selected by governmental authority, whilst in determining specific gravity, the body, if solid or liquid, is compared with a standard which is universal,—i.e., an equal bulk of pure water expressed as 1¹ and taken at a given temperature and atmospheric pressure. In all the methods hereafter detailed, it must be borne in mind that the main object sought for is *the weight of a bulk or volume of water equal to that of the body that we wish to take the specific gravity of.* Archimedes proved experimentally that *a body immersed in a liquid lost as much weight as its own bulk of that liquid weighed:* hence is derived the general rule for taking specific gravity,—

RULE.—Divide the weight of the body by the weight of water displaced (loss of weight in water), the quotient will be the specific gravity.

The taking of specific gravity will be considered as follows :

1. Solids insoluble in, but heavier than water.
2. Solids soluble in, but heavier than water.
3. Solids insoluble in, but lighter than water.
4. Solids soluble in, but lighter than water.

1. To take the specific gravity of a solid insoluble in, but heavier than water.

a. With the Balance.—It is customary to recommend a special balance for taking the specific gravity of solids, known technically as the hydrostatic balance; but a good prescription or analytical balance will answer perfectly for practical purposes. The substance, preferably in one piece, is first weighed accurately and the weight noted; a horse-hair is then tied around it with a slip-knot, and a tight loop at the other end is made, which is attached to the hook at the end of the scale-beam; a small wooden bench made for the purpose, or extemporized by taking out the bottom and one of the sides of a small wooden or stiff paste-board box, is now arranged over the scale-pan so that it does not touch it or interfere with its free movement; upon this a small beaker or wide-mouthed jar is placed, and two-thirds filled with pure water (see Fig. 41). The horse-hair must be adjusted to such length that it will permit of the complete immersion of the substance in the water. Upon weighing the immersed substance, after freeing it from attached air-bubbles, it will be at once noticed that it has lost weight, and all that

¹ The temperature usually specified in the U. S. Pharmacopœia of 1890 is 15° C. (59° F.); when not specified, it is intended to mean 15° C. (59° F.); but in many investigations, particularly those conducted in Europe, the temperature selected is that of the maximum density of water, 4° C. (39.2° F.). For practical purposes the temperature of 25° C. (77° F.) is most useful in the latitude of the United States, but it is rarely used.

remains to be done is to apply the rule, divide the weight of the body by its loss of weight in water.

For example, 805.5 grains of copper lose by immersion in water 90 grains; then 805.5 divided by 90 gives 8.95, the specific gravity of the copper. See also Nicholson's hydrometer, p. 85.

b. With the Specific Gravity Bottle.—This instrument in its most usual form is a bottle having an elongated, narrow neck, fitted with a ground-glass stopper, and holding, when filled, exactly 1000 grains of pure water at a given temperature (see Fig. 42). The reason for selecting 1000 grains for the contents is to avoid the necessity of making a calculation to obtain the specific gravity of a liquid.¹ To use the instrument for a solid

FIG. 41.

Taking the specific gravity of a solid.

FIG. 42.

1000-grain bottle.

substance, the previously-weighed body is dropped into the bottle, which is then filled with water at the temperature of 15°C . (59°F .), the bottle carefully dried, and, after the counterpoise (the exact weight of the empty bottle) has been placed upon the opposite scale-pan, it is weighed. To obtain the *loss of weight* in water of the substance, it is only necessary to deduct the weight of the contents of the bottle (*i.e.*, that of the water and the immersed body) from the weight of the body in air, plus that of the water which the bottle holds when full,—*i.e.*, 1000 grains; the rule is then to be applied, divide the weight of the body by its loss of weight in water.

Example.—A piece of aluminum wire weighs 100 grains; when dropped into a 1000-grain bottle, and the bottle filled with water at the proper temperature, the weight of both is 1062 grains. As the bottle when filled with water alone held 1000 grains, and as the weight of the aluminum in air is 100 grains, both together weigh 1100 grains; hence 1100 grains, less 1062 grains, gives 38 grains, the loss of weight of the

¹ See specific gravity of liquids, p. 77.

aluminum in water. *Apply the rule,* $\frac{100}{38} = 2.63$, sp. gr. The specific gravity of any insoluble powder, like calomel, litharge, etc., may be taken in exactly the same way, but care must be observed to agitate the powder with a small quantity of water in the bottle, before adding the rest, to cause the bubbles of air to escape.

c. *With the Graduated Tube.*—A graduated tube is provided in which each space indicates a grain or a gramme (C.c.) of water (or better if graduated in smaller subdivisions); the zero mark should be somewhat above the bottom of the tube, as shown in Fig. 43. Now, if water be poured into the tube exactly up to the zero mark, and a weighed solid body dropped into it, the water will rise in the tube and indicate the weight of a bulk of water equal to that of the substance; this is equivalent to the loss in water: *then apply the rule*, divide the weight of the body by its loss of weight in water. It is evident that this method cannot be as accurate as either of those above mentioned, as small differences are more clearly indicated by a good balance than by tube-reading.

d. *By immersing the solid in a transparent liquid of the same density.*—This method may be applied where the body is small, is not very heavy specifically, and is insoluble in the liquid. A heavy liquid is chosen, like solution of mercuric nitrate; the solid is found to float on the surface of the liquid, and water is added until the solid neither rises nor sinks, but swims indifferently: the specific gravity of the solid will of course be that of the liquid, which may be ascertained by the specific-gravity bottle (see page 77).

2. To take the specific gravity of a solid soluble in, but heavier than water.

A liquid must be selected in which the solid is insoluble, like olive oil, almond oil, benzin, or oil of turpentine: the specific gravity of the oil having been ascertained, it is used just as if it were water, the object being to find out the loss of weight that the substance suffers when immersed in the oil; this having been obtained, a simple proportion must be made, as follows: as the specific gravity of the oil is to the specific gravity of water, so is the loss of weight in the oil to the loss of weight in water: *then apply the rule*, divide the weight of the body by its loss of weight in water.

Example.—200 grains of citric acid lose by immersion in oil 115 grains; then, as

Sp. gr. of oil.	Sp. gr. of water.	Loss of weight in oil.	Loss of weight in water.	
.920	: 1.000	:: 115	: 125	$\frac{200}{125} = 1.6$, sp. gr. of citric acid.

It is obvious that either the balance, specific-gravity bottle, or gradu-

FIG. 43.

Graduated specific-gravity tube.

ated tube can be used in this case; but it is possible in some cases to coat the soluble substance with varnish and treat it then as an insoluble substance, and thus avoid the use of an oily liquid. A pill of blue-mass may be coated with shellac varnish, and then treated as an insoluble substance as in 1, *b*. The practical difficulty, however, is to secure a thin coating which shall be impervious to water.

3. To take the specific gravity of a solid insoluble in, but lighter than water.

The solution of this problem requires the aid of a heavy insoluble body, which is to be attached to the light body, so as to secure the immersion of both: it is plain that if the loss of weight in water of the heavy substance is deducted from the loss of weight in water of both the heavy and the light body, the result must give the loss of weight in water of the light body alone: then *the rule must be applied*, divide the weight of the body by its loss of weight in water.

Example.—A piece of paraffin weighs 174 grains, a piece of brass loses by immersion in water 6 grains; when the brass is attached to the paraffin, both together lose by immersion in water 206 grains; by deducting 6 grains (the loss in water of the brass) from 206 grains (the loss in water of both) the loss in water of the paraffin alone is found,—*i.e.*, 200 grains; then $\frac{174}{200} = 0.870$, sp. gr. of paraffin. See also Nicholson's hydrometer, p. 85.

4. To take the specific gravity of a solid soluble in, but lighter than water.

The use of the specific-gravity bottle is recommended in cases of this kind, and the process is the same as in 2: the selection of a suitable liquid lighter than the body, and in which it is insoluble, is, however, usually attended with difficulty. The proportion would be, as the specific gravity of the light liquid is to the specific gravity of water, so is the loss of weight in the light liquid to the loss of weight in water. Then *the rule must be applied*, divide the weight of the body by the loss of weight in water.

SPECIFIC GRAVITY OF LIQUIDS.

The *specific-gravity bottle* (*pycnometer* or *pyknometer*) is the most accurate instrument for taking the specific gravity of liquids. Fig. 42 shows an improved form: it is used as follows. The liquid to be tested is first brought to the proper temperature, 4° C. (39.2° F.), 15.6° C. (60° F.), or 15° C. (59° F.), according to the standard selected for the bottle; the bottle is filled with the liquid to the mark on the neck, dried carefully, and weighed accurately, using the counterpoise on the opposite pan. If the 1000-grain or 100-gramme bottle has been used, the weight of the liquid at once indicates the specific gravity: thus, the bottles would hold 1163 grains or 116.3 grammes of hydrochloric acid, 1250 grains or 125 grammes of glycerin, 725 grains or 72.5 grammes of ether, and 13,558 grains or 1355.8 grammes of mercury, and the specific gravity of each would be respectively 1.163, 1.250, 0.725, and 13.55, thus directly showing the relation to the specific gravity of water, 1. To

show the use of an ordinary prescription-vial in this process, one containing about a fluidounce may be taken; if it holds 455.7 grains of pure water to a mark upon the neck it will be convenient, because it will at the same time give the weight of a fluidounce of the liquid. It is evident that a bottle holding any moderate quantity may be used in the same way.

A fluidounce bottle would hold 529.9 grains of hydrochloric acid, 569.6 grains of glycerin, 830.3 grains of ether, and 6178.5 grains of mercury, and the specific gravity would be obtained by the following proportion:

Example.—As 455.7, the number of grains of pure water that the bottle holds, is to 1.000, the specific gravity of water, so is 529.9, the number of grains of hydrochloric acid that it holds, to 1.163, the specific gravity of hydrochloric acid. $455.7 : 1.000 :: 529.9 : 1.163$.

In practice, it is simply necessary to divide the number of grains of liquid that the bottle holds by 455.7 and adjust the decimal point, or multiply the weight of the liquid by 2.1945, the modulus of the bottle. The accuracy of these bottles depends entirely upon the care with which they are made and used, and it is better to scratch, with a file, two marks upon the neck of a long-necked flask, one showing the upper edge of the meniscus and the other marking the lowest point (see Fig. 44). In filling, it is a good practice, after bringing the liquid to the proper temperature, to exceed slightly the quantity indicated by the mark on the neck, and then to make a small roll of filtering-paper and neatly absorb the excess by inserting the roll in the neck so that it shall just touch the surface. The more expensive specific-gravity bottles have an accurately-fitted stopper made of thermometer-tube, and hold exactly 100 grammes, or 1000 grains, when the bottle, including the capillary tube of the stopper, is entirely full (see Fig. 42). They are not so convenient as a correctly-marked, narrow-necked bottle (see Figs. 44 and 46), nor are they practically more accurate. They have to be filled to the brim and the stopper then inserted; this causes an overflow, and the necessary wiping and the natural warmth of the hands usually expand the liquid by raising the temperature, and prevent accurate results.

A more elaborate form of apparatus for taking specific gravity is needed for some purposes; for instance, where standards are required for the liquid preparations of the Pharmacopœia or in investigations where great accuracy is necessary. Dr. Squibb has devised the pycnometer shown in Fig. 46, which is admirably adapted for taking specific gravity with the objects above mentioned.

Specific-gravity bottle.

Lovi's beads.

A set of these bottles is shown in the illustration; the stopper is a tube lengthened out so that the central channel will permit the bottle to hold the volume of water at any temperature between 4°C. (39.2°F.) and 25°C. (77°F.), thus permitting any of the standards of tempera-

FIG. 46.

Squibb's specific-gravity apparatus.

ture to be used, the tube being graduated to half-millimetres, and at the top it is enlarged so as to allow room for the expansion of light liquids and to permit the bottle to be loosely closed with a cork whilst adjusting the temperature, the cork being removed during the weighing. These bottles are all used in a bath of water containing ice when the lower standard temperatures are used; a leaden collar to keep the bottle in position in the bath, a pipette for coarsely adjusting the volume of liquid, and a thermometer are also shown in Fig. 46.

It is necessary to verify the marks of the contents of the bottles from time to time, as the glass flask contracts for a year or two after it has been made. The liquid that it is designed to test is weighed into the bottle, as in the ordinary cases of taking specific gravity; the bottle is loosely corked, loaded with the leaden collar, and set in a bath of water which has been brought to the desired temperature. When the liquid

in the bottle has reached the same temperature (and this is indicated by the liquid in the tube remaining stationary, a careful watching of the rise or fall of the liquid in the graduated tube being necessary in order to determine this), the final adjustment is made and the bottle weighed.

Lovi's beads, or *specific-gravity beads*, are sometimes used for taking the specific gravity of liquids; they are especially useful in cases where a boiling liquid is to be evaporated until it has a given specific gravity, and in mixing liquids of different densities. They are balloon-shaped, hollow globes of glass, of different sizes and weights, having specific-gravity figures scratched upon their sides: these figures indicate the specific gravity of a liquid in which the beads swim indifferently; they neither rise nor sink, when not disturbed at the given temperature, if the specific gravities of the bead and liquid are the same. The illustration, Fig. 45, shows their method of use; those heavier than the liquid sinking, those lighter floating, whilst the one supported indifferently (1.25) indicates the specific gravity of the liquid. *Lovi's beads* may be defined as hydrometers which indicate but one specific gravity.

HYDROMETERS.

Hydrometers, sometimes called *areometers*, are floating instruments which are used to indicate the specific gravities of liquids by sinking to a depth corresponding to the densities of the liquids. Their principle of action was probably first made known by Archimedes, and depends upon the fact that when a solid body is placed in a liquid in which it is capable of floating, it sinks to a certain point, and this floating-point is reached when the body has displaced a volume of liquid exactly equal to its own weight. Thus, if a hydrometer has a specific gravity exactly three-fourths that of water, it will sink in water until exactly three-fourths of its volume is immersed; the same hydrometer would swim indifferently, like a *Lovi's bead*, in ether having the specific gravity of 0.750, for the obvious reason that the specific gravities of the solid and liquid are identical. Hydrometers may be divided into two classes for convenience of study: 1. Those in which the weight is constant, but the depth of immersion subject to change. 2. Those in which the depth of immersion is constant, but the weight subject to change. To the first class belong nearly all the hydrometers specially useful to pharmacists, and of these, two kinds are generally used, one for liquids heavier than water, the other for those lighter. They are known as Baumé's, Cartier's, Gay-Lussac's, Zanetti's, Twaddell's, but the best of all is the specific-gravity scale hydrometer. To the second class belong the hydrometers which are intended to sink, by the addition of weights, to a given mark on the stem, and thus displace a constant volume, like Fahrenheit's, Nicholson's, Guyton de Morveau's, etc.

1. **Hydrometers in which the weight is constant, but the depth of immersion subject to change.**

Baumé's Hydrometers.—This form is treated first in detail because it was the first one of its class to come into general use, having been originally described by Baumé in his "*Elémens de Pharmacie*." Two

instruments were used by Baumé, one termed *Pèse-Acide* or *Pèse-Sirop*, for liquids heavier than water, the other *Pèse-Esprit*, for liquids lighter than water. This hydrometer, as now made, consists of a glass tube loaded at the bottom with mercury or small shot, having a bulb blown in it just above the loaded end. A

FIG. 47.

Cylindrical hydrometer.

simple cylindrical tube (see Fig. 47), loaded so as to cause it to assume an upright position in a liquid, may be used as a hydrometer: the only advantage gained in expanding the lower portion into bulbs is one of convenience, that of increasing the volume of the hydrometer and thus permitting the use of shorter instruments. The graduations upon the stem of Baumé's hydrometer are entirely arbitrary, and were made in the following manner:

For the hydrometer to be used for liquids heavier than water, sufficient mercury was added to the lower bulb to cause it to sink in water to a convenient point near the top of the stem: this was marked 0. The instrument was then placed in a solution containing fifteen per cent. by weight of common salt, and the point at which it rested was marked 15: the space between these two points was divided into fifteen equal parts, and the scale below was extended by marking off similar spaces. For liquids lighter than water, the instrument was placed in a ten-per-cent. by weight solution of common salt, and loaded so that it floated at a point just above the bulb: this was marked 0. The hydrometer was then transferred to water, the point at which it rested was marked 10, the space between was divided into ten equal parts, and the scale above was extended by marking off similar spaces. The illustrations, Figs. 48, 49, were drawn from Pile's hydrometers, and show the manner of graduating the Baumé scale for both hydrometers, and, in addition, the corresponding specific-gravity figures. The Baumé hydrometer is rapidly going out of use, being replaced by a hydrometer having a graduated scale, in which the graduations represent the specific gravities.

The specific-gravity scale hydrometer, which should be used exclusively, is more

FIG. 48.

FIG. 49.

Hydrometer, double scale.

convenient and useful to the pharmacist. The graduations upon the stem are not arbitrarily chosen, but indicate at once the specific gravity of a liquid when floated in it. Two hydrometers are necessary, one for liquids heavier than water, and one for liquids lighter than water; for special purposes it is often desirable to have five or six hydrometers, beginning with one for very light liquids and ending with one for very heavy liquids, and if the diameter of the stem is narrow the divisions in the scale are not so close together, and thus a more accurate reading of the graduations is possible and the delicacy of the hydrometer increased. It must be borne in mind, however, that the hydrometer cannot be as accurate an instrument for taking specific gravity as the specific-gravity bottle: the adhesion of air-bubbles when in use, the liability to variation in the diameter of the stem, the inaccuracies in the scale and the difficulties of adjusting it so as to give correct readings, and the want of uniformity among the makers in fixing the reading-point, render it necessary for the pharmacist to verify each instrument and note its error before accepting it for practical use. In selecting a hydrometer with a specific-gravity scale, it should be at once noticed whether the graduated spaces are equal: if they are, it is useless to attempt to verify it, as it cannot be accurate, for the degree of the immersion varies with the specific gravity of the liquid, and "equal differences of specific gravity cannot be indicated by equal spaces on the scale, but by the differences of the reciprocals of those specific gravities, or by proportionate quantities." In the hydrometer shown in Fig. 48, the arbitrary scale of Baumé, made up of equal spaces, is shown immediately in contact with a specific-gravity scale: the spaces of the latter gradually increase in size from below upward, and the highest space is nearly four times the size of the lowest. The method of graduating this scale differs with different makers, but by the use of Clarke and Ackland's

FIG. 50.

Hydrometer jar.

process it is possible to make a scale without using any other liquid than water if a correct table of reciprocals is employed (see Watts's Dictionary, vol. iii. p. 207). Before any hydrometer is accepted for use, it should be tested by floating it in water at the temperature indicated on the hydrometer, and, the specific gravity of several liquids having been ascertained carefully by the specific-gravity bottle, the hydrometer should be floated in the same liquids, and any deviation carefully noted. A hydrometer which registers uniformly one or two points too low or too high need not be rejected, because the error can be added or subtracted each time and the constant error marked on the box for a memorandum; but if an error of any magnitude has to be added to one part of the scale, and another subtracted from another part, it is economy to reject the instrument at once. Hydrometers are usually floated in tall, cylindrical glass jars (see Fig. 50), and it is frequently necessary to cool the liquid by placing the jar in ice-water after inserting a thermometer, and, after the temperature has been lowered to the desired point, observing the point to which the hydrometer sinks in the liquid. It is to be regretted that there is no fixed rule for a

reading-point; some makers adjust their instruments so as to read from a reflection in the upper part of the meniscus, others (probably the majority) prefer to take the exact level of the liquid, disregarding the meniscus altogether; this may be easily done in all cases where the liquid is transparent, or nearly so, by holding the jar containing the hydrometer at first exactly on a level with the eye, and then glancing slightly below, when a line can be traced which will exactly join the divided surface of the liquid upon either side of the stem: in case of opaque liquids an allowance can be made for the meniscus. The pharmacist should choose one or the other method and adhere to his choice, so that his verification of his own hydrometer may not vary (see Fig. 51, in which the arrow shows the point to read). It is usually best to cool the liquid below the standard temperature adopted for the hydrometer, and then, after wiping the jar, the correct higher temperature may be gradually obtained by grasping the jar with the hands and passing them up and down to warm the liquid. A hydrometer having an elongated bulb with cylindrical sides, as shown in Fig. 52, is more likely to give a false indication if permitted to touch the sides of the jar than one having an oval or globular bulb (see Fig. 51); the latter can touch the jar at only one point, and hence can move freely up and down, whilst the former may have one side touching the side of the jar for its entire length. To obviate this, Dr. Squibb suggests the use of a jar with four perpendicular indentations in it, and a hydrometer having an oval bulb (see Fig. 51). The points of contact between the urinometer bulb and the indentations in the jar are best shown in the transverse sectional view immediately below the cut of the urinometer.

The *urinometer* is one of the most useful special applications of the hydrometer; as its name indicates, it is used to take the specific gravity of urine; a special scale, which is easily understood, is sometimes used. The very delicate stem, which hardly permits of the use of specific-gravity figures, is divided into sixty spaces, numbered from 0 to 60; by adding 1000 to each of these numbers, and pointing off three decimal places from the right, the true specific gravity is shown. In Dr. Squibb's urinometer the specific gravity is indicated without abbreviation, the number highest on the scale being 1.000, the lowest 1.060, the intervening figures being 1.010, 1.020, 1.030, 1.040, and 1.050.

The specific gravity of urine from healthy subjects ranges from 1.010 to 1.020; that from diabetic patients has a specific gravity varying from 1.030 to 1.060.

The *saccharometer* is intended to take the specific gravity of syrups. The scale is sometimes graduated so as to indicate the percentage of sugar in solution, rarely the actual specific gravity: usually Baumé's scale

FIG. 51.

Sectional view.

(*pèse-sirop*) is used. The *elcometer*, a very delicate instrument, is used to take the specific gravity of fixed oil. The *lactometer* is employed in detecting the adulteration of milk with water: it has a limited range,

Fig. 52.

Alcoholmeter.

and the scale usually shows the points at which it floats in milk mixed with different proportions of water. Hydrometers are often made for taking the specific gravity of liquids, like benzin, ether, petroleum, vinegar, wine, beer, solutions of silver nitrate, sea-water, etc.; probably the most useful to the pharmacist of all of those having special applications is the one made for testing alcohol.

Alcoholmeters may be purchased which combine the thermometer with the hydrometer, as shown in Fig. 52, and the scale frequently has the percentage by volume of absolute alcohol marked opposite the corresponding specific gravity; when graduated so as to show the percentage by weight, they are more useful, however, on account of the adoption of the principle of parts by weight in the U. S. Pharmacopœia of 1880, thus obviating the necessity of using an alcoholmetrical table or making a calculation.

Tralles's hydrometer is an alcoholmeter having a centesimal scale: it is used by the United States government in gauging spirits, and is in general use by distillers and others. Each division of the scale corresponds to a given percentage of pure alcohol by volume in the liquor. In the United States Dispensatory, 17th Edition, p. 1816, a table is given showing the value of Tralles's degrees in specific gravity and Baumé's degrees.

Cartier's hydrometer, largely used in France, is merely a modification of Baumé's *pèse-esprit*, or hydrometer for liquids lighter than water; the zero of the scale is the same as Baumé's (10°), but the degrees are not of the same value, 32° of Baumé's scale being equal to 30° Cartier. Dorvault gives the following approximate rule for conversion: Cartier's degrees may be converted into Baumé's by subtracting 10, multiplying the remainder by .08, and adding the product to Cartier's degree.

Baumé's degrees may be converted into Cartier's by subtracting 10, multiplying the remainder by .08, and subtracting the product from Baumé's degree.

Gay-Lussac's centesimal alcoholmeter has a scale divided into 100 unequal degrees: the zero corresponds to pure water at 15° C. (59° F.) and 100° to absolute alcohol. The advantage of this method is that every intermediate degree expresses the percentage of pure alcohol by measure contained in the spirit: thus, when the instrument stands at 50° in an alcoholic liquid, it indicates that 100 measures of the liquid contain 50 of pure alcohol.

Sikes's hydrometer is used in Great Britain in the collection of the excise revenue: it is a brass instrument having a spherical bulb, with a weight at the bottom to make it float upright; the stem is divided

into twenty parts, and every other division numbered, from 0 to 10. A series of nine weights are furnished with the instrument, numbered from 10 to 90; these are to be added to the weight at the bottom to cause the hydrometer to sink, so that a reading may be had on the graduated scale; this reading added to the number on the weight employed, gives a figure which indicates the strength of the spirit by referring to a table which accompanies the instrument.

Jones's hydrometer is similar to Sikes's, but by many is regarded as an improvement on it.

Dica's hydrometer belongs to the same class.

Twaddell's hydrometer is frequently employed in England, and technical works often quote the degrees of this scale. It is used for liquids heavier than water, and is graduated so that the number of the degree, multiplied by 5 and added to 1000, gives the specific gravity: thus, 20° Twaddell indicates the specific gravity of 1100 or 1.100; 50° Twaddell, 1250 or 1.250.

Beck's hydrometer is rarely used or referred to: in this scale 0 corresponds to the specific gravity 1.00, and 30 to that of 0.850; the scale is extended equally above and below 0. For tables, see Bayley's Chemist's Pocket-Book, p. 178.

Zanetti's hydrometers have a scale which requires the addition of a cipher to the number of the degree to show the specific gravity.

2. Hydrometers in which the depth of immersion is constant, but the weight subject to change.

Fahrenheit's hydrometer was one of the first instruments of this class to come into general use. Robert Boyle described, however, in 1675, his "New Essay Instrument," and Fahrenheit's hydrometer was very similar to it in principle; it had but a single mark on the stem, which was surmounted by a small scale-pan; weights were placed in the pan to cause the hydrometer to sink to the mark. Now, as this mark indicated the point at which the instrument would float in water at a given temperature when certain weights were placed on the pan, it follows that when it was immersed in a liquid of different specific gravity the weights would have to be changed to float the instrument to the fixed mark; the ratio which this weight bore to the weight used for water gave the specific gravity.

Nicholson's hydrometer is similar in principle to Fahrenheit's, but is modified so that it can be used for taking the specific gravity of heavy or light solids. Fig. 53 is an illustration of one of the most convenient forms of the instrument; it is usually made of brass; there is a single mark on the stem and a scale-pan on the summit. To the lower extremity of the hydrometer two conical cups are attached; their apexes are joined so as to resemble an hour-glass; the lowest cone has several apertures at the top, to permit

of the escape of air when the instrument is immersed. The weight of the hydrometer is usually so adjusted that a 1000-grain weight is needed on the scale-pan to float it to the mark on the stem. Now, to take the specific gravity of a piece of zinc weighing less than 1000 grains, the 1000-grain weight is removed from the pan and the piece of zinc substituted for it, weights are added until the instrument floats at the mark on the stem, and it is found that an addition of 655 grains has been necessary: it is evident that the difference between 1000 and 655 gives the weight in air of the zinc, 345 grains. The zinc is now placed in the upper conical cup and weights are again placed upon the scale-pan, and it is found that the zinc has lost in weight 50 grains by immersion in water; the specific gravity is obtained by applying the well-known rule, divide the weight of the body by the loss of weight in water: $\frac{345}{50} = 6.9$, sp. gr. of zinc. The lower cup is used for taking the specific gravity of bodies lighter than water, and is very convenient, the weight of the hydrometer keeping the light body submerged when the lower cup is placed over it: the specific gravity is obtained in the same manner as in the case of bodies heavier than water. One of the advantages of Nicholson's hydrometer is that it can be used in place of a balance for weighing small quantities, as shown above.

METHODS OF TAKING THE SPECIFIC GRAVITY OF SMALL QUANTITIES OF LIQUIDS.

Mohr's Apparatus.—The illustration of this apparatus (see Fig. 54) represents an improved form, yet it is quite possible for a pharmacist to construct one for himself that will answer practical purposes. It will be noticed that one end of the beam is divided into ten equal spaces, and a small glass thermometer is suspended from the extremity by a slender platinum wire, whilst the opposite scale-pan is so adjusted that it exactly counterbalances the thermometer. When the thermometer is immersed in pure water at 15° C. (59° F.), a brass wire weight is placed upon the hook at the end of the beam, and this restores the equilibrium. Now, it is apparent that if a lighter liquid, like alcohol at 15° C. (59° F.), is substituted for the water, the equilibrium cannot be maintained, and the thermometer will sink: the brass wire weight is then to be moved along the beam towards the central knife-edge until the balance is nearly restored, and this point will be found at 8, which gives the first decimal figure; still further to approach equilibrium, a wire weight, one-tenth the weight of the larger one, is pushed along the beam until it rests at the 2-mark, which gives the second decimal figure; whilst thoroughly to restore the balance the smallest weight (still one-tenth smaller) is placed at 5, and thus the third decimal figure is obtained, and the specific gravity of the alcohol is shown to be 0.825. Specific gravities of liquids heavier than water are obtained in the same way, except that the large brass-wire weight is left hanging on the hook at the end of the beam and additional weights are placed upon the beam until equilibrium is restored.

A prescription balance could be easily converted into a Mohr's appa-

ratus, and the thermometer replaced by a glass stopper suspended by a horse-hair. The thermometer in the improved form of apparatus merely serves to indicate the temperature and act as a convenient weight: in the home-made apparatus especial care must be exercised in adjusting the wire-hook weight so as exactly to immerse the stopper in water at the proper temperature.

Gannal's Method.—Gannal suggested a very convenient modification of this method of taking the specific gravity of a liquid. A piece of glass, "densimètre hydrostatique," having the shape of an olive, has a volume of 10 cubic centimetres. This is suspended from the hook at the end of the beam of a balance by a horse-hair (see Fig. 41), and weights are added to the opposite scale-pan until the balance is restored; it is then immersed in the liquid, and the metric weight required to restore the equilibrium gives the specific gravity without a calculation.

Mohr's specific-gravity apparatus.

Specific-Gravity Pipette.—Grauer recommends the use of a small pipette having a fine orifice at the lower end, and at the upper end a short piece of rubber tube closed by a pinchcock; a mark is scratched on the pipette to show where a convenient weight of water rises to (1 C.c.); enough of the liquid to be tested is sucked through the tube to rise to the mark, it is then closed; the weight of the liquid indicates its specific gravity.

Rousseau's Densimeter.—This ingenious instrument is constructed upon the plan of a hydrometer (see Fig. 55). The stem from B to C is divided into 20 equal parts; the cup-shaped tube upon the summit of the stem holds exactly 1 cubic centimetre. When the densimeter is floated in water at the proper temperature, it sinks to the point C at the bottom of the stem; when the cup is filled with water to the cubic-centimetre mark, it causes the instrument to sink to the point B; this space, B C, being then divided into 20 equal parts, it follows that each division corresponds to $\frac{1}{20}$ of a gramme, or 0.05 Gm. If one cubic centimetre of oil of rose were placed in the cup, it would sink the densimeter to 17.2 divisions of the scale; then $17.2 \times 0.05 = 0.860$, sp. gr. of oil of rose.

SPECIFIC VOLUME.

Specific volume in pharmacy may be defined as the volume of one body compared with the volume of an equal weight of another body selected as the standard, both bodies having the same temperature. It is directly the opposite of specific gravity. The temperature chosen is usually 15° C. (59° F.). 1. To obtain the specific volume of a liquid.—Rule, Divide the volume of the given weight of the liquid by the volume of an equal weight of water, or divide the specific gravity of water

(1.000) by the specific gravity of the liquid. Ex. 1420 Gm. of nitric acid measure 1000 C.c., and 1420 Gm. of water measure 1420 C.c.;

then $\frac{1000}{1420} = .7042$, sp. vol. of nitric acid. 2. To obtain the volume of a

given weight of a liquid.—Rule, Multiply the volume of an equal weight of water by the sp. vol. of the liquid. Ex. How many fl. oz. are there in 100 oz. av. of nitric acid? 100 oz. av. of water measure 96.01 fl. oz.; then $96.01 \times .7042 = 67.61$ fl. oz. of nitric acid.

Specific volume has not been used practically in this country to any extent, although there are many instructive features about it, specific gravity being employed almost exclusively, the weight standard having been selected in preference to that of volume.

Very early in the tyro's experience the fact is recognized that pound bottles designed for different liquids vary in size, a pint bottle, for instance, of water (which may be regarded as a rough standard) holding about a pound avoirdupois; the same bottle, however, would only be four-fifths full if a pound of glycerin were poured into it, and two-thirds full if chloroform were used, whilst a pound of benzin would fill the pint bottle, and there would be enough to spare to fill another pint bottle. A bottle which would hold a pound of ether would hold two pounds of chloroform, and a pint bottle holding one pound of water holds fourteen pounds of mercury. These facts are of course capable of the explanation that the specific volumes of liquids lighter than water are greater than that of water, whilst those of liquids heavier than water are less. An instructive and useful bottle may be made by selecting a flask with a long and not very narrow neck (see Fig. 56),

FIG. 56.

Specific-volume bottle.

the bulb of which would hold about 100 C.c. of water at 4° C.; if the neck would hold about 50 C.c. of the same liquid at the same temperature, and a mark was made at the 100 C.c. point and the tube graduated from 100 C.c. to 150 C.c., it would follow that in order to find the specific volume of any lighter liquid within the capacity of the bottle, all that would be necessary would be to pour into the flask 100 Gm. of such liquid at the proper temperature and read off the point to which the liquid rises. A bottle to be used for heavy liquids would have the 100 C.c. mark at the top of the neck and the C.c. graduations below decrease in value. A bottle of limited range may be constructed having the 100 C.c. mark half-way between the top of the bulb and the top of the neck.

That specific volume is the antithesis of specific gravity is shown by the fact that in order to obtain the specific volume of a liquid the measure of a given weight of the liquid is divided by the measure of an equal weight of water, and (as has been shown heretofore) specific gravity is obtained by dividing the weight of a given measure of the liquid by the weight of an equal measure of water; therefore it follows that when the specific volume of a liquid is multiplied by its specific gravity the product must be 1, or the specific gravity of water.

Specific Volumes and actual Weights and Measures corresponding with given Specific Gravities (Dr. A. B. Lyons).

1.84	.5435	.00030	52.18	1.193	57.25	13414.8	1138.42	1.9164
1.85	.5405		51.90	1.186	56.94	13487.7	1142.98	1.9268

The third column is used for supplying figures not specified in the table. For instance, if the sp. vol. of carbon bisulphide having sp. gr. 1.272 is desired: the nearest sp. gr. is 1.270 and the corresponding sp. vol. .7874; the difference in sp. vol. corresponding with .001 in sp. gr. given in the next column is .00062. Now, $1.272 - 1.270 = 0.002$; then $.00062 \times 2 = .00124$, and $.7874 - .00124 = .78616$, sp. vol. of carbon bisulphide. Again, if the volume of 100 oz. av. of the same liquid is desired, column 4 gives the volume of a liquid of 1.270 sp. gr. as 75.60 fl. oz. The correction for a difference of .001 in specific gravity is found by subtracting the succeeding term from the volume corresponding with sp. gr. 1.270 (removing the decimal point one place to the left), multiplying the remainder by 2, and subtracting this from the volume corresponding with sp. gr. 1.270; thus, $75.60 - 75.01 = .59$; then $.59 \times 2 = .118$, and $75.60 - .118 = 75.482$ fl. oz., the volume of 100 oz. av. carbon bisulphide.

PRACTICAL PROBLEMS AND EXERCISES

(CHAPTER I.—METROLOGY)

ILLUSTRATING THE USES OF WEIGHTS, MEASURES, SPECIFIC GRAVITY, AND SPECIFIC VOLUME.

(The answers to these questions will be found in the Appendix.)

1. If Dover's powder contains one grain of powdered ipecac, one grain of powdered opium, and eight grains of powdered sugar of milk, how much of each ingredient will be needed to make one pound (av.)?
2. What is the percentage of each ingredient in Dover's powder?
3. Add the following together, giving the answer in grains: ℥iv , ℥ij , ℥vi , 2 oz.
4. Subtract ℥x from 10 oz.
5. How much postage would be required to send this book, weighing 4 lb. 8 oz., to Brazil, the rate being one cent for each 2 oz. or fraction?
6. How many fluidounces are there in a wine gallon?
7. How many minims are there in a pint?
8. In an Imperial pint?
9. How many grains are there in 4 oz. of water?
10. In ℥℥iv ?
11. In ℥iv ?
12. How many wine gallons are there in 40 Imperial gallons?
13. How many avoirdupois pounds in 5 wine gallons of water?
14. How many fluidrachms in an Imperial half-pint of water?
15. A physician ordered, as an application to a burn, 4 tablespoonfuls of linseed oil to be mixed with a teacupful of lime-water: what are the equivalent quantities in apothecaries' measure?
16. A traveller was ordered by his physician to take with him on a journey enough of a quinine mixture to last five weeks, taking one teaspoonful three times a day for the first week, one twice a day for the second week, one once a day for the third week, one four times during the fourth week, and one twice during the fifth week: how many fluidounces of the mixture must the apothecary compound for him?
17. A physician wants a pharmacist to make him one fluidounce of a one-per-cent. aqueous solution of cocaine hydrochlorate: how will he do it?
18. How much quinine, strychnine, and ferric phosphate would be required to make a pint of elixir of iron, quinine, and strychnine, so that each teaspoonful of finished elixir should contain $\frac{1}{4}$ of a grain of strychnine, one grain of quinine, and two grains of ferric phosphate?
19. What would an Imperial gallon of rose-water cost at the rate of 12 cents a pound (av.)?
20. A merchant offered to exchange 2 oz. of musk, valued at 4 cents per grain, for 20 Imperial gallons of orange-flower water, valued at 17 cents per pound: how much would he gain or lose?
21. Express the following: 7.5 metres in millimetres. 22. 806.23 centimetres in metres. 23. Six metres and three decimetres. 24. Twelve metres, five decimetres, four centimetres, and three millimetres. 25. Twelve thousand five hundred and forty-three millimetres.
26. Write one metre and one millimetre.
27. Read 25 Dm.
28. Read 25 dm.
29. Is the equivalent number of centimetres usually read in practice instead of using the term decimetres?
30. Read 1.2 M.
31. How does this practice resemble that in daily use in relation to our decimal system of coinage? (See No. 30.)
32. Read 4263.678 M.
33. Add 816 cm., 732 dm., and 36 mm.
34. What is the difference in length between two roots, one being 5 cm. long, the other 65 mm. long?

35. Divide 3784.128 M. by 8.

36. How many square millimetres are there in 5 square centimetres?

NOTE.—In square measure length is multiplied by width ($10 \times 10 = 100$), hence each denomination is increased or decreased by 100 instead of by 10; two decimal places are therefore required to express square measure.

37. Write eight sq. metres, thirty-six sq. decimetres.

38. Write eight sq. metres, thirty-six sq. decimetres, eight sq. centimetres.

39. Write three sq. m., three sq. dm., three sq. cm., three sq. mm.

40. Express in figures twenty sq. millimetres, twenty sq. centimetres, twenty sq. decimetres, twenty sq. metres.

41. Express in figures five hundred sq. metres, five hundred sq. decimetres, five hundred sq. millimetres.

42. How many cubic centimetres in a cubic metre?

NOTE.—In cubic measure length is multiplied by width and this by thickness: $10 \times 10 \times 10 = 1000$; so that three decimal places are required to express cubic measure.

43. Express in figures sixty-three cubic metres, sixty-three cubic decimetres, sixty-three cubic centimetres, sixty-three cubic millimetres.

44. How many cubic centimetres in a litre?

45. What metric measure of capacity corresponds with a cubic decimetre?

46. How many 100 C.c. bottles will be required to hold five litres of water?

47. A drug merchant having purchased a cubic metre of olive oil, sold from it at different times 100 litres, 87 litres, 875 C.c., 638 litres: how much had he left?

48. In making one kilo. of U. S. 1880 compound spirit of juniper, how many grammes of each ingredient would be required, the formula being as follows: Oil of juniper 10 parts, oil of caraway 1 part, oil of fennel 1 part, alcohol 8000 parts, water 1988 parts?

49. How many grains of each ingredient would be required to make one pound avoirdupois? (See No. 48.)

50. What percentage of an avoirdupois pound is a troy pound?

51. How much water must be added to a pint of solution of chloride of iron (containing 37.8 per cent. of anhydrous salt) to make the solution contain 10 per cent. of anhydrous salt?

52. How much of the solution of chloride of iron and how much water must be used to make a pint of solution containing 20 per cent.? (See No. 51.)

53. If moist opium containing $10\frac{1}{2}$ per cent. morphine loses 80 per cent. of its weight by drying, how much morphine per cent. will it contain when dry?

54. If one pint of a solution contains 704 grains, how much is there in each fluidrachm?

55. If one fluidrachm of a solution contains $8\frac{1}{2}$ grains, how much is there in $14\frac{1}{2}$ fluidounces?

56. If 8 fluidounces contain 240 doses, how much in each dose?

57. How many doses of $12\frac{1}{2}$ minims in $12\frac{1}{2}$ fluidounces?

58. If 96 minims of water will dissolve $7\frac{1}{2}$ grains of salt, how much will one pint dissolve?

59. How much will one pound avoirdupois dissolve? (See No. 58.)

60. How much will one pound troy dissolve? (See No. 58.)

61. If liquor acidi arsenosi contains 87 grains of arsenous acid in 8 fluidounces, what fraction of a grain (exactly) is there in a fluidrachm?

62. If liquor ferri citratis (specific gravity 1.260) contains 35.5 per cent. of anhydrous salt, how much of the anhydrous salt is contained in 1 pint?

63. How much in one fluidrachm? (See No. 62.)

64. If liquor ferri nitratis contains 6 per cent. of anhydrous salt (specific gravity 1.050), how much of the salt is there in each fluidounce?

65. If liquor ferri sulphatis contains 43.7 per cent. of basic ferric sulphate (specific gravity 1.560), how much of the salt is contained in one pound avoirdupois?

66. How much in one pint? (See No. 65.)

67. How much in one fluidrachm? (See No. 65.)

68. How many minims would contain 10 grains? (See No. 65.)

69. Liquor ferri tersulphatis (specific gravity 1.320) contains 28.7 per cent. of normal ferric sulphate: how much in Oj?

70. If liquor acidi arsenosi contains 74 grains of arsenous acid in Oj, what quantity of the liquid contains one grain?

71. How many pills of 285 mg. can be made from a mass weighing 428 grammes?

72. How many cubic inches are there in one litre? (1 litre = 2.1134 pints)?
73. What part of a litre is a pint (to four decimal places)?
74. How many C.c. in a cubic foot (1 C.c. being equal to 0.061028 cubic inches)?
75. How many C.c. in a quart (1 L. = 33.815 fl. oz.)?
76. How many pints in one cubic metre (1 decilitre being equal to 3.3815 fluid-ounces)?
77. How many fluidrachms in a litre?
78. How many grammes in one pound avoirdupois?
79. How many grammes in a quart of a liquid of specific gravity 1.45 (1 gramme = 15.432 grains)?
80. How many milligrammes in one pound troy?
81. How many centimetres in one yard (1 mm. = .03937 inch)?
82. What is the weight in grammes of 14 cubic centimetres of mercury, its specific gravity being 13.5?
83. What is the weight in grammes of 555 cubic centimetres of sulphuric acid of specific gravity 1.84?
- 83a. What is its weight in kilogrammes? (See No. 83.)
- 83b. What is its weight in milligrammes? (See No. 83.)
84. How many metres are there in a mile (1 metre = 39.37048 inches)?
85. How many inches in 1833 centimetres?
86. How many grains of compound extract of colocynth are required to make 144 compound cathartic pills (there being 65 grs. in 50 pills)?
87. How much jalap is contained in one pound avoirdupois of compound powder of jalap (the official process ordering 35 parts in 100)?
88. What percentage must be added to 400 minims to bring the measure up to one fluidounce?
89. If 82.4 grammes be divided into 144 pills, what is the weight of each pill in grains?
90. If 46.656 grammes be divided into 144 pills, what is the weight of each pill in grammes? What in grains?
91. How much valerian must be used to make 4 pints of tincture, so that each fluidrachm shall represent 10½ grains?
92. If a Seidlitz powder is composed of 35 grains of tartaric acid, 120 grains bicarbonate of sodium, and 40 grains Rochelle salt, how much Rochelle salt must be used to make enough Seidlitz mixture to put up one gross of boxes of Seidlitz powders, each box to contain ten doses?
93. How much bicarbonate of sodium? (See No. 92.)
94. How much tartaric acid? (See No. 92.)
95. How many decilitres of oil (specific gravity .905) will a bottle hold which weighs, when full of water, 1050.5 Gm., the weight of the bottle being 610.5 Gm.?
96. If a body weighs 2.31 kilogrammes in air and 1.76 kilogrammes in water, what is its specific gravity?
97. A piece of lead weighs 148.392 pounds, and measures 12 inches long, 6 inches wide, and 5 inches thick (cubic in. water = 252 + gr.): what is its specific gravity?
98. A piece of zinc weighs in air 77.88 grains, in water 65.88 grains: what is its specific gravity?
99. What is its specific volume? (See No. 98.)
100. What is the weight of a piece of iron measuring 50 cm. long, 6 cm. wide, and 2 cm. thick, its specific gravity being 7.8?
101. What is the length of a bar of iron 8 cm. wide, 5 cm. thick, its specific gravity being 7.8 and its weight 195 kilogrammes?
102. What is the weight of a piece of iron measuring 4 decimetres long by 1 decimetre wide and 7 centimetres thick (specific gravity 7.8)?
103. One pound av. of lead shot is put into a bottle, and it is then filled with water and found to weigh 25,566 grains (the bottle when filled with water alone weighs 19,174 gr.): what is the specific gravity of the lead?
104. What is the specific gravity of a substance of which 9.7 C.c. equal 40.74 Gm.?
105. What is the specific gravity of a liquid of which one pound avoirdupois will measure one pint?
106. If 52.49 C.c. of a liquid weigh 1207 grains, what is its specific gravity, and what is the liquid (Oj = 473.11 C.c.)?
107. If 64.888 C.c. of a liquid weigh 1250 grains, what is its specific gravity, and what is the liquid?
108. What is the weight in grammes of one pint of glycerin (Oj = 473.11 C.c.)?
109. What is the weight in grammes of one fluidounce of glycerin?
110. What is the weight of Oj chloroform in grammes (specific gravity 1.49)?

111. What is the weight of one fluidounce of chloroform in grammes?
112. What part of a litre is a pint (to four decimal places)?
113. What part of a gallon is a fluidrachm?
114. What part of a gallon are 32 minims?
115. What part of one pound avoirdupois are $1\frac{1}{4}$ ounces troy?
116. What is the specific gravity of a piece of wood which weighs in air 177.45 grains? A piece of brass weighs 68.25 grains when immersed in water. The wood and brass together immersed in water weigh 85.7 grains.
117. A piece of wood (specific gravity = 1.6), when weighed in oil of turpentine (specific gravity = .87), loses 217.5 grains in weight: what is its weight? (Its loss in weight (in oil) divided by the specific gravity of the oil is equal to its loss in weight in water. This multiplied by its specific gravity gives its weight.)
118. A bottle full of water weighs 31 ounces avoirdupois; the same bottle filled with oil (specific gravity 0.91) weighs 29 ounces 245 grains avoirdupois. How many avoirdupois ounces of water will the bottle hold? What is the weight of the bottle?

NOTE.—To find the capacity divide the difference between the two weights by the difference between the two specific gravities.

119. How many C.c. would the same bottle hold? (See No. 118.)
 120. What is the weight of a piece of iron 25 inches long, 4 inches wide, and 2 inches thick, its specific gravity being 7.8 (cu. in. water = 252.609 gr.)?
 121. What is the capacity in C.c. of a vessel which will hold 2 pounds avoirdupois of glycerin?
 122. If one pound avoirdupois of lead, when weighed in water, loses 611 grains, what is its specific gravity?
 123. A bar of iron, when immersed in water, loses 18 per cent. of its weight: what is its specific gravity?
 124. A piece of copper, when immersed, loses $\frac{1}{4}$ of its weight: what is its specific gravity?
 125. A troyounce of silver, when weighed in water, weighs 484.72 grains: what is its specific gravity?
 126. A druggist proposes exchanging 5 pints of carbolic acid (specific gravity 1.065), valued at 40 cents per pound (avoirdupois), for 5 pints of glycerin (U.S. P.), valued at 32 cents per pound: does he gain or lose by the exchange, and how much?
- To find the specific gravity of a liquid by immersing a solid in it: *Immerse in it a solid of known specific gravity and weight; carefully note its loss of weight when thus immersed; then use the proportion. As its weight in air is to its specific gravity, so is its loss of weight when immersed in the liquid to the specific gravity of that liquid.* If the weight of the solid is made the same number in grains as its specific gravity, its loss of weight, when immersed in the liquid, is equal to the specific gravity of the liquid.

127. A piece of iron weighs 1560 grains; its specific gravity is 7.8. When immersed in syrup it loses 262 grains' weight: what is the specific gravity of the syrup?
128. A piece of aluminum weighing 256 grains, having the specific gravity 2.56, loses 82 grains when immersed in a liquid: what is the specific gravity of the liquid? What is the liquid?
129. What is the volume of a block of ice 12 feet long, 8 feet wide, and 2 feet thick? What is its weight, and how many cubic feet of water will it yield when melted, supposing that water upon freezing increases in volume $\frac{1}{9}$? (See No. 120.)
130. How many gallons and parts and how many pounds and parts of water will it take to fill a vessel 14 inches wide, 21 inches long, and 9 inches deep (cu. in. water = 252.609 gr.)?
131. What is the specific volume of mercury?
132. What is the specific volume of diluted sulphuric acid?
133. What is the specific volume of glycerin?
134. What is the specific volume of iodoform?
135. How much (wine measure) will one pound (avoirdupois) tincture of chloride of iron measure (specific gravity = .980)?
136. If 65.1 Gm. of Rochelle salt be divided into seven powders, what would be the volume of water equal to the weight of one powder?
137. How much nitrate of silver must be used to make 2 fluidounces of a 4-per-cent. solution of the nitrate? (See No. 17.)
138. A bottle when filled with syrup (specific gravity 1.31) contains 23.58 ounces (av.): how much nitric acid (specific gravity 1.42) will it contain?
139. A bottle when filled with syrup (specific gravity 1.31) weighs 36 ounces, 285

grains (av.), when filled with oil (specific gravity .9) it weighs 30 ounces, 219 grains: what is the weight of the bottle? Of the syrup? Of the oil? (See No. 118.)

140. A bottle when filled with syrup (specific gravity 1.31) weighs 84.96 ounces (av.), when filled with nitric acid (specific gravity 1.42) it weighs 86.72 ounces: what is the weight of the bottle, and how much water will it hold? (See No. 118.)

141. A bottle filled with water weighs 32 ounces (av.), when filled with chloroform (specific gravity 1.47) it weighs 39.755 ounces (av.), when filled with acid it weighs 34.64 ounces: what acid does it contain? (See No. 118.)

ALLIGATION APPLIED TO PHARMACY.

(The answers to these questions will be found in the Appendix.)

Rules for ascertaining the quantities of drugs of different percentages of strength, to be used in making a mixture of definite strength; also of liquids where no change of volume takes place when mixed.

PERCENTAGES.

Rule.—Write the percentages of the different ingredients in a horizontal row; connect with a line each percentage which is greater than that of the mixture sought with one that is less, and each one that is less than that of the mixture sought with one that is greater; then write the difference between the percentage of the mixture sought and that of each of the ingredients under the percentage of the other ingredient or ingredients with which it is connected by the line. The figures thus placed under each percentage will be found to indicate the proportionate parts (by weight) of each ingredient to be used.

It is apparent that where there are more than two ingredients there will be an indefinite number of ratios. Either one of the ingredients of less strength than the mixture may vary, and therefore one or more of the other ingredients must vary correspondingly.

The same rules are applicable to liquids of different specific gravities (where no change of volume takes place when they are mixed), writing "specific gravities" in place of "percentages."¹

SPECIFIC GRAVITIES.

Rule.—Write the specific gravities of the different ingredients in a horizontal row; connect with a line each specific gravity which is greater than that of the mixture sought with one that is less, and each one that is less than that of the mixture sought with one that is greater; then write the difference between the specific gravity of the mixture sought and that of each of the ingredients under the specific gravity of the other ingredient or ingredients with which it is connected by the line. The figures thus placed under each specific gravity will be found to indicate the proportionate parts (by measure) of each ingredient to be used.

1. In what proportion must two quantities of powdered opium, containing respectively 7 and 18 per cent. of morphine, be mixed so that the mixture shall contain 16 per cent.?

$$\begin{array}{r} 16 \\ \hline 7 \quad 18 \\ \hline 2 \quad 9 \end{array}$$

Answer.
2 parts of 7 p. c.
9 parts of 18 p. c.
11 parts.

Proof.
 $2 \times 7 = 14$
 $9 \times 18 = 162$

 $11 \overline{)176}$
16

2. In what proportions to yield a mixture of 14 per cent.? (See No. 1.)

3. In what proportions may three quantities, containing respectively 7, 16, and 18 per cent., be mixed so that the mixture shall contain 14 per cent.?

¹ Of course, mixed liquids which contract may be allowed to stand until contraction ceases, and sufficient liquid can then be added to make up the intended measure.

$$\begin{array}{ccccccc}
 & & 14 & & & & \\
 & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & \\
 7 & & 16 & & 18 & & \\
 \hline
 2 & & 7 & & 7 & & \\
 \hline
 4 & & & & & & \\
 \hline
 6 & & & & & &
 \end{array}$$

<i>Answer.</i>			
6 parts of 7 p. c.	=	42	
7 parts of 16 p. c.	=	112	
7 parts of 18 p. c.	=	126	
20 parts.		280	
		14	

When there are three or more ingredients the proportion of these may be varied indefinitely, as will appear from the following:

In the preceding example suppose that only one part of that containing 16 per cent., and the same number of parts containing 7 per cent. as before be used, it will then require more than 7 parts of that containing 18 per cent. to make the mixture contain 14 per cent.

When the quantities of more than one ingredient are given, each quantity may be multiplied by its percentage and the sum of the products divided by the sum of the quantities; this will give the mean percentage of the quantities.

Thus 6 parts of 7 p. c.	}	= 7 parts of 8½ p. c.
1 part of 16 p. c.		
6 × 7 = 42		
1 × 16 = 16		
7)	58
		8½ p. c.

$$\begin{array}{ccccccc}
 & & 14 & & & & \\
 & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & \\
 8\frac{1}{2} & & 16 & & 18 & & \\
 \hline
 4 & & & & 5\frac{1}{2} & &
 \end{array}$$

and it will require 4 parts of 8½ per cent. and 5½ parts of 18 per cent. to make a mixture containing 14 per cent. Now if 4 parts of 8½ per cent. require 5½ parts of 18 per cent., then 7 parts of 8½ per cent. will require 10 parts of 18 per cent., or 4 : 5½ :: 7 : 10; therefore the mixture will be—

6 parts of 7 p. c.	6 × 7 = 42
1 part of 16 p. c.	1 × 16 = 16
10 parts of 18 p. c.	10 × 18 = 180
17) 238 (14
	17
	68
	68

The different percentages may be connected in various ways, care being taken that in every case one larger than the required mixture shall be connected with one smaller, but every one must be connected with some other.

4. In what proportions may four quantities, containing respectively 7, 8, 16, and 18 per cent., be mixed so that the mixture shall contain 14 per cent.?

$$\begin{array}{ccccccc}
 & & 14 & & & & \\
 & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & \\
 7 & & 8 & & 16 & & 18 \\
 \hline
 4 & & 2 & & 6 & & 7
 \end{array}$$

<i>Answer.</i>			
4 parts of 7 p. c.	=	28	
2 parts of 8 p. c.	=	16	
6 parts of 16 p. c.	=	96	
7 parts of 18 p. c.	=	126	
19 parts.		266	(14

Or,

$$\begin{array}{ccccccc}
 & & 14 & & & & \\
 & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & \\
 7 & & 8 & & 16 & & 18 \\
 \hline
 2 & & 4 & & 7 & & 6
 \end{array}$$

<i>Answer.</i>			
2 parts of 7 p. c.	=	14	
4 parts of 8 p. c.	=	32	
7 parts of 16 p. c.	=	112	
6 parts of 18 p. c.	=	108	
19 parts.		266	(14

5. In what proportions may four quantities, containing respectively 9, 15, 16, and 18 per cent., be mixed, so that the mixture shall contain 14 per cent.?

$$\begin{array}{ccccccc}
 & & 14 & & & & \\
 & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & & \overbrace{\hspace{1.5cm}} & \\
 9 & & 15 & & 16 & & 18 \\
 \hline
 1 & & 5 & & 5 & & 5 \\
 \hline
 2 & & & & & & \\
 \hline
 4 & & & & & & \\
 \hline
 7 & & 5 & & 5 & & 5
 \end{array}$$

6. In what proportions may five quantities, containing respectively 7, 8, 9, 11, and 16 per cent., be mixed, so that the mixture shall contain 14 per cent.?

7. How much of each kind of scammony, containing respectively 77 per cent., 83 per cent., and 92 per cent., may be used to make a mixture containing 85 per cent.?

8. How much scammony of 90 per cent. must be mixed with 7 ounces of 80 per cent. and 5 ounces of 82 per cent. to make the mixture contain 85 per cent.?

$$\begin{array}{l} 7 \text{ oz.} \times 80 \text{ p. c.} = 560 \\ 5 \text{ oz.} \times 82 \text{ p. c.} = 410 \end{array} \left. \vphantom{\begin{array}{l} 7 \text{ oz.} \times 80 \text{ p. c.} = 560 \\ 5 \text{ oz.} \times 82 \text{ p. c.} = 410 \end{array}} \right\} = 12 \text{ oz. of } 80\frac{1}{2} \text{ p. c.}$$

$$\begin{array}{r} 85 \\ \hline 80\frac{1}{2} \quad 90 \\ \hline 5 \quad 4\frac{1}{2} \end{array}$$

Then if 5 ounces of the mixture require $4\frac{1}{2}$ ounces of 90 per cent., 12 ounces of mixture will require 10 ounces of 90 per cent. $5 : 4\frac{1}{2} :: 12 : 10$.

$$\begin{array}{r} 7 \text{ oz.} \times 80 \text{ p. c.} = 560 \\ 5 \text{ oz.} \times 82 \text{ p. c.} = 410 \\ 10 \text{ oz.} \times 90 \text{ p. c.} = 900 \\ \hline 22 \qquad \qquad 22)1870(85 \\ \qquad \qquad \qquad 176 \\ \qquad \qquad \qquad \hline \qquad \qquad \qquad 110 \\ \qquad \qquad \qquad \hline \qquad \qquad \qquad 110 \end{array}$$

9. What quantities (by measure) of glycerin (specific gravity 1.250) and alcohol (specific gravity .820) must be mixed to have the specific gravity 1.

$$\begin{array}{r} 1.000 \\ \hline 1.250 \quad .820 \\ \hline 180 \quad 250 \end{array}$$

$$\begin{array}{l} 180 \text{ or } 18 \text{ parts glycerin.} \\ 250 \text{ or } 25 \text{ parts alcohol.} \\ \hline 48 \end{array}$$

$$\begin{array}{r} 18 \times 1.25 = 22.50 \\ 25 \times .820 = 20.50 \\ \hline 43. \end{array}$$

$$48 + 48 = 1.000$$

10. What quantities (by measure) of glycerin (specific gravity 1.250) and diluted alcohol (specific gravity .928) must be mixed to have the specific gravity 1.

11. How much each of alcohol 94 per cent. and 60 per cent. must be used to make 100 ounces (by weight) of 80 per cent.?

$$\begin{array}{r} 80 \\ \hline 94 \quad 60 \\ \hline 20 \quad 14 \\ \hline \text{Or, } 10 \quad 7 \end{array}$$

$$17 : 10 :: 100 : 58.82$$

$$\begin{array}{r} 100. \\ 58.82 \text{ of } 94 \text{ p. c.} \\ \hline 41.18 \text{ of } 60 \text{ p. c.} \end{array}$$

When the quantity of one of the ingredients is given, to find the quantities of the other ingredients:

Proceed as before to find the ratios of the ingredients; then by proportion. As the ratio of that ingredient of which the quantity is given is to its quantity, so is the ratio of each ingredient to its quantity.

12. How much alcohol and how much glycerin must be mixed with 24 C.c. of syrup (specific gravity 1.81) to make 250 C.c. of mixture having the specific gravity 1. (no allowance for contraction)?

$$\begin{array}{r} 24 \quad 250 \\ 1.81 \quad 24 \\ \hline 24 \quad 226 \\ 72 \\ \hline 24 \\ \hline 31.44 \end{array}$$

$$\begin{array}{r} 250 \\ 31.44 \\ \hline 226)218.56(.967 \\ \qquad 2084 \\ \qquad \hline \qquad 1516 \\ \qquad 1356 \\ \qquad \hline \qquad 1600 \\ \qquad 1682 \\ \qquad \hline \qquad 18 \end{array}$$

$$\begin{array}{l} 24 \text{ parts sp. gr. } 1.81 \\ 226 \text{ parts sp. gr. } .967 \end{array}$$

$$\begin{array}{r} .967 \\ \hline .820 \quad 1.25 \\ \hline 288 \quad 147 \end{array}$$

$$\begin{array}{l} 288 \text{ alcohol,} \\ 147 \text{ glycerin,} \\ \hline 430 \end{array}$$

$$\begin{array}{r} .820 \quad 282 \\ 1.25 \quad 183.5 \\ \hline 415.5 \end{array}$$

$$\begin{array}{r} 430)415.5(.966+ \\ \qquad 3870 \\ \qquad \hline \qquad 2850 \\ \qquad 2580 \\ \qquad \hline \qquad 2700 \end{array}$$

If 430 parts of mixture require 283 alcohol, how much will 226 require?

$$430 : 283 :: 226 : 148.7; \text{ then } 226 - 148.7 = 77.3$$

148.7 C.c. alcohol, 77.3 C.c. glycerin, 24 C.c. syrup.

When the quantity of more than one ingredient is given, each quantity may be multiplied by its specific gravity and the sum of the products divided by the sum of the quantities; this will give the mean specific gravity of the quantities.

13. In what proportions must three pints each of alcohol (specific gravity 0.935 and 0.865) be mixed with alcohol of specific gravity 0.820 so that the mixture shall have the specific gravity 0.835?

$$\begin{array}{r} 3 \times 0.935 = 2805 \\ 3 \times 0.865 = 2595 \\ \hline 6 \qquad 6)5400 \\ \qquad \qquad 900 \end{array}$$

3 pints of 0.935 and 3 pints of 0.865 are equal to 6 pints of 0.900 (mean specific gravity).

Then,

$$\begin{array}{ccc} & 0.835 & \\ 0.820 & & 0.900 \\ \hline 65 & & 15 \\ 18 & & 3 \end{array}$$

as 3 pints of specific gravity 0.900 are required to be mixed with 18 pints of .820 to make the specific gravity 0.835, so 6 pints will require twice 18 pints, or 26 pints of alcohol (specific gravity 0.820), to be added to 3 pints each of 0.865 and 0.935 to bring the whole to specific gravity 0.835.

14. How much opium containing 8 per cent. of morphine must be mixed with 10 troy ounces of opium containing 17 per cent. to make the mixture contain 14 per cent.?

15. How much opium of 16 per cent. must be mixed with 1 troy ounce of opium of 12 per cent. to make the mixture 13 per cent.?

16. How much scammony of 92 per cent. must be mixed with 1 troy ounce of 75 per cent. to make the mixture 85 per cent.?

17. How much alcohol of 35 per cent. (by weight) will 1 quart of alcohol (U. S. P.) make on dilution with water?

18. How much opium of 16½ per cent. must be mixed with 4 ounces (10 per cent.) and 5 ounces (11 per cent.) to make the mixture 14 per cent.?

19. How much opium of 15½ per cent. must be mixed with 3 ounces (9 per cent.), 3½ ounces (10 per cent.), and 3¼ ounces (12 per cent.) to make the mixture contain 14 per cent.?

When the quantity of the mixture and the percentages of the ingredients are given, to find the quantity of each of the ingredients:

Proceed as before to find the ratio of the ingredients, and then by proportion. As the whole amount of difference is to any one difference, so is the amount of the required mixture to the required amount of that particular difference.

20. An apothecary has opium of the following percentages, viz.: 8, 11, 16, and 18: how much of each kind may be used to make 10 troy ounces of 14 per cent.?

$$\begin{array}{ccccccc} & & 14 & & & & \\ 8 & & 11 & & 16 & & 18 \\ \hline 2 & & 4 & & 6 & & 8 \end{array}$$

$$\begin{array}{rcl} 2 \times 8 & = & 16 \\ 4 \times 11 & = & 44 \\ 6 \times 16 & = & 96 \\ 8 \times 18 & = & 144 \\ \hline 15 & & 15)210(14 \\ & & 15 \\ & & \hline & & 60 \\ & & \hline & & 60 \end{array}$$

15 : 2 :: 10 : to the required amount of 8 per cent.

2 ounces = 960 grains.

15 : 960 :: 10 : 640 grains.

If 2 parts correspond to 640 grains, 3 parts will correspond to 960 grains, 4 parts to 1280 grains, and 6 parts to 1920 grains; thus,

$$\begin{array}{rcl} 640 \text{ grains,} & 8 \text{ p. c.} \\ 1280 \text{ grains,} & 11 \text{ p. c.} \\ 1920 \text{ grains,} & 16 \text{ p. c.} \\ 960 \text{ grains,} & 18 \text{ p. c.} \\ \hline 4800 \text{ grains} & = & 10 \text{ troy ounces.} \end{array}$$

$$\begin{array}{rcl} 15 : 1920 :: 10 : 1280 \\ 15 : 2880 :: 10 : 1920 \\ 15 : 1440 :: 10 : 960 \end{array}$$

21. How many parts by weight of official alcohol must be added to diluted alcohol to make it the strength of 60 per cent. by weight?

$$\begin{array}{r} 60 \\ \hline 45.5 \quad 91 \\ \hline 81 \quad 14.5 \end{array}$$

$$\begin{array}{rcl} 81 \text{ parts,} & 45.5 & = \\ 14.5 \text{ parts,} & 91 & = \\ \hline 45.5 & & 2780.0 \end{array}$$

$$2780 + 45.5 = 60$$

22. How much to 1 pound (avoirdupois)? (See No. 21.)

23. An apothecary has two kinds of opium, one $18\frac{1}{2}$ per cent., the other 16 per cent; he desires to make 8 troy ounces of 14 per cent.: how much of the weaker kind must he use?

24. I have two qualities of cinchona, containing respectively $1\frac{1}{2}$ and $3\frac{1}{2}$ per cent. of quinine: how much of each shall I take to make the mixture contain 2 per cent.?

$$\begin{array}{r} 2 \\ \hline 1\frac{1}{2} \quad 3\frac{1}{2} \\ \hline 1\frac{1}{2} \quad \frac{1}{2} \end{array}$$

$$\begin{array}{rcl} 1\frac{1}{2} \text{ oz.} & = & 900 \text{ grains,} \quad 75 \\ \frac{1}{2} \text{ oz.} & = & 192 \text{ grains,} \quad 16 \end{array}$$

25. Two qualities containing $\frac{1}{2}$ of 1 per cent. and $3\frac{1}{2}$ per cent.: how much of each shall I take to make the mixture contain 2 per cent.?

26. Two qualities containing 1.285 per cent. and 2.345 per cent.: how much of each shall I take to make the mixture contain 2 per cent.?

27. Two qualities containing 1.676 per cent. and 3.188 per cent.: how much of each shall I take to make the mixture contain 2 per cent.?

28. Three qualities: .840 per cent., 1.848 per cent., and 2.688 per cent.: how much of each shall I take to make the mixture contain 2 per cent.?

29. Having the three qualities, as before, and having 5 ounces of the percentage .840, how much of the mixture will it yield?

$$\begin{array}{rcl} \text{If 43 parts are equal to 5 oz.,} & & .840 \\ 82 \text{ parts are equal to 9 oz.,} & 256\frac{1}{2} \text{ grains,} & 2.688 \\ 43 \text{ parts are equal to 5 oz.,} & & 1.848 \\ \hline \text{oz. } 19 + 256\frac{1}{2} \text{ grains.} & & \end{array}$$

30. Having the three qualities, as before, with 5 ounces of the percentage .840, and wishing to make 32 ounces of the mixture, how much of each of the others must be used?

In this case proceed to find by previous rules how much of percentage 2.688 will be required to mix with the 5 ounces, .840, to make the mixture 2 per cent.

This amount of mixture subtracted from 32 ounces will give the amount remaining to be made up of the other two percentages,—1.848 and 2.688.

$$\begin{array}{r} 2 \\ \hline 0.840 \quad 2.688 \\ \hline .688 \quad 1160 \\ \hline 86 \quad 145 \end{array}$$

$$\begin{array}{rcl} 86 : 5 :: 145 : 8.4302 \\ 5 \text{ oz.} & \text{of} & 0.840 \\ 8.4302 \text{ oz.} & \text{of} & 2.688 \\ \hline 18.4302 \text{ oz.} & \text{of} & 2 \text{ p. c.} \end{array}$$

Subtracting this from 32 ounces leaves 18.5698 ounces to be made up.

$$\begin{array}{r} 2 \\ \hline 1.848 \quad 2.688 \\ \hline .688 \quad 152 \\ \hline 86 \quad 19 \end{array}$$

$$\begin{array}{rcl} 86 & & \\ 19 & & \\ \hline 105 : 18.5698 \text{ oz.} :: 86 : 15.2095 \text{ oz. of } 1.848. \end{array}$$

Or, subtracting this from 18.5698 ounces gives 3.3603 of 2.688; adding 8.4302 gives the whole amount used of 2.688 per cent. = 11.7905.

31. A solution of tersulphate of iron is found to have the specific gravity 1.3464: how much water must be added to make it of the official strength (1.320)?

$$\begin{array}{r} 1.3200 \\ \hline 1.3464 \quad 1.000 \\ \hline .3200 \quad .0264 \\ \hline \text{Or, } 82 \quad 2.64 \end{array}$$

$$\begin{array}{rcl} 32 \text{ fl. oz. of solution.} & & \\ 2.64 \text{ fl. oz. of water.} & & \end{array}$$

32. How much water must be added to 5 pints of solution of tersulphate of iron (specific gravity 1.3464) to make it of the official strength?

33. A solution of tersulphate of iron is found to have the specific gravity 1.312: how can it be made of the official strength?

The easiest method is to evaporate a portion of it until its specific gravity is considerably above the official strength (1.320) and then mix the proper quantities of the two solutions.

Suppose a portion of it has been evaporated until it has the specific gravity 1.332: how much of each solution must be taken to make 24 fluidounces of specific gravity 1.320?

$$\begin{array}{r}
 1.320 \\
 \hline
 1.312 \quad 1.332 \\
 12 \quad \quad 8 \\
 \hline
 \text{Or, } 3 \quad \quad 2
 \end{array}
 \qquad
 \begin{array}{l}
 8 \text{ fl. oz. of } 1.312 \\
 2 \text{ fl. oz. of } 1.332
 \end{array}
 \left. \vphantom{\begin{array}{l} 8 \\ 2 \end{array}} \right\} = 5 \text{ fl. oz. of } 1.320.$$

$$\begin{array}{l}
 5:3 :: 24:14.4 \\
 5:2 :: 24:9.6
 \end{array}
 \qquad
 \begin{array}{l}
 14.4 \text{ fl. oz. of sp. gr. } 1.312 \\
 9.6 \text{ fl. oz. of sp. gr. } 1.332
 \end{array}$$

34. How much water must be added to 2 pounds of stronger water of ammonia (28 per cent.) to reduce it to water of ammonia (10 per cent.)?

$$\begin{array}{r}
 10 \\
 \hline
 28 \quad 0 \\
 10 \quad 18
 \end{array}
 \qquad
 10:18 :: 32: \quad 57.6 \text{ oz. water.}$$

35. How much water must be used to make 2 pounds of 10 p. c. water of ammonia?

36. How much official alcohol (vol.) must be added to 2 pints of alcohol of 76 per cent. (vol.) to make it 81 per cent. (vol.) (no allowance for contraction)?

37. How much official alcohol (vol.) must be added to 2 pints of 70 per cent. (by volume) to make the mixture 85 per cent. by weight, 87.8 by volume (no allowance for contraction)?

QUESTIONS ON CHAPTER I.

METROLOGY.

Define Metrology.

What does its present and less strict definition include?

What is weight?

What is measure?

What is specific gravity?

In the history of Metrology, how many distinctly-marked periods may be traced?

Describe the peculiarities of each period.

What was the original weight of the English silver penny?

What is the origin of the avoirdupois pound?

How did the custom originate of druggists using one system of weights for buying drugs and another for compounding them?

When were the Imperial measures and standards adopted in Great Britain?

What relation does the yard bear to the length of a pendulum beating seconds?

What is the weight in grains of the pound troy?

What is the weight in grains of the pound avoirdupois?

What is the weight in grains of a cubic inch of distilled water?

What is the weight of an Imperial gallon of distilled water?

What is the weight of a wine gallon of distilled water?

How many cubic inches does a wine gallon contain?

How is the pound troy divided?

How is the pound avoirdupois divided?

What is the difference in grains between the troy ounce and the avoirdupois ounce?

What is the difference in grains between the troy pound and the avoirdupois pound?

How is the U. S. wine gallon divided?

How is the Br. Imperial gallon divided?

What is the weight in grains of a pint of distilled water (U. S.)?

What is the weight in grains of a fluidounce of distilled water (U. S.)?

What is the weight in grains of a troy ounce of distilled water (U. S.)?

What is the weight in grains of an avoirdupois ounce of distilled water?
 What is the weight in grains of an Imperial fluidounce of distilled water (Br.)?
 What is the estimated capacity of a teacupful?
 What is the estimated capacity of a wineglassful?
 What is the estimated capacity of a tablespoonful?
 What is the estimated capacity of a teaspoonful?
 What is the standard or unit of measurement in the metric or decimal system?
 How is it derived?
 Why is the system called the metric system?
 Why is the system called the decimal system?
 How is the unit of capacity derived?
 How is the unit of weight derived?
 How are the multiples of the various units expressed?
 How are the divisions of the various units expressed?
 What word has been suggested as a useful mnemonic?
 Give the names of the various denominations of length.
 Give the names of the various denominations of capacity.
 Give the names of the various denominations of weight.
 Which of these terms are used in the U. S. Pharmacopoeia?
 What is the meaning of a micromillimetre?
 What are the chief merits of the metric system?
 What is the length of a metre?
 What is the capacity of the litre in pints?
 What is the measure of a gramme of distilled water?
 What is the weight of a gramme in grains?
 What is the chief disadvantage of the metric system?
 How are the metric weights usually divided?
 How can you convert metres into inches?
 How can you convert centimetres into inches?
 How can you convert millimetres into inches?
 How can you convert litres into fluidounces?
 How can you convert litres into pints?
 How can you convert litres into Imperial pints?
 How can you convert litres into Imperial gallons?
 How can you convert cubic centimetres into fluidounces?
 How can you convert cubic centimetres into Imperial fluidounces?
 How can you convert grammes into grains?
 How can you convert grammes into avoirdupois ounces?
 How can you convert grammes into troy ounces?
 How can you convert centigrammes into grains?
 How can you convert milligrammes into grains?
 How can you convert kilogrammes into avoirdupois ounces?
 How can you convert kilogrammes into avoirdupois pounds?
 How can you convert kilogrammes into troy ounces?
 How can you convert inches into metres?
 How can you convert inches into centimetres?
 How can you convert inches into millimetres?
 How can you convert pints into litres?
 How can you convert fluidounces into cubic centimetres?
 How can you convert Imperial pints into litres?
 How can you convert Imperial gallons into litres?
 How can you convert Imperial fluidounces into C.c.?
 How can you convert grains into grammes?
 How can you convert grains into centigrammes?
 How can you convert grains into milligrammes?
 How can you convert avoirdupois ounces into kilogrammes?
 How can you convert avoirdupois ounces into grammes?
 How can you convert avoirdupois pounds into kilogrammes?
 How can you convert troy ounces into kilogrammes?
 How can you convert troy ounces into grammes?
 How are the metric units spelled by the French?
 How are the metric units spelled by the U. S. Pharmacopoeia?
 How should 0.050 m. be read?
 How should 0.055 m. be read?
 How should 0.0555 m. be read?
 In measures of capacity less than a litre, what terms are used?

- In weight, when the quantity is relatively large, what terms are used?
 In quantities less than a kilogramme and greater than a gramme, what terms are used?
 In quantities below the gramme, what terms are used?
 What is a balance?
 What particulars are necessary to obtain correct results?
 Name the various kinds of pharmaceutical balances in use.
 Describe a single beam, equal arm balance.
 When the beam is in a horizontal position, where should the centre of gravity be?
 Give a simple illustration of the principle of suspending a beam.
 What particulars are necessary in regard to the end knife-edges?
 What is the effect if the end knife-edges are not equidistant from the central knife-edge?
 What if the central knife-edge is not in line with the end knife-edges?
 What if the knife-edges are not parallel with each other?
 What are the requisites for the beam of a fine balance in order to secure accuracy in weighing?
 Why should the beam of the balance be rigid and non-elastic?
 Why should it be no heavier than necessary in order to secure the requisite strength?
 What advantages have agate knife-edges and planes over those made of steel?
 How may a balance be tested for accuracy?
 What are the advantages of having the balance supported by a rigid metallic column?
 Wherein does an analytical balance differ from an ordinary prescription balance?
 What sort of counter scales was formerly in use?
 What has taken its place generally in more recent times?
 Upon what principle are the single beam, unequal arm balances constructed?
 Describe the vest-pocket prescription balance.
 Describe the double beam, unequal arm balance.
 What are its advantages?
 Describe a scale made to weigh liquids.
 What is the principal objection to such balances?
 What principle is adopted in making platform scales?
 What is the principle of the torsion balance?
 Of what weights does a pile of avoirdupois weights consist?
 What is meant by block weights?
 What is the objection to the use of a wooden block?
 How are troy weights usually arranged?
 How are iron metric weights usually shaped?
 What weights are generally used for analytical purposes?
 What is the best material and form for grain weights for prescription purposes?
 Why are aluminum weights preferable to brass?
 What are the advantages of aluminum wire weights?
 What measures are commonly used for measuring liquids when the quantity is more than a pint?
 What when the quantity is one pint or less?
 What effect has denting upon tinned iron or copper measures?
 Describe the forms of graduated glass measures in common use.
 Which is preferable, and why?
 Describe Hodgson's graduated measures.
 Describe Hobb's graduated measures.
 What is an objection to either of these, and how may it be remedied?
 What objection is there to using minim graduated measures?
 How may greater accuracy be obtained?
 How is a pipette used?
 Do the terms minim and drop always mean the same?
 About how many drops are there in a fluidrachm of water? *Ans.* 60.
 In a fluidrachm of syrup of acacia? *Ans.* 44.
 In a fluidrachm of chloroform? *Ans.* 250.
 In a fluidrachm of tincture of opium? *Ans.* 180.
 What is specific gravity?
 How much weight does a body lose by being immersed in water?
 What is the rule for finding the specific gravity of a body?

How is the specific gravity taken of a solid, insoluble in but heavier than water, by means of a balance?

How by means of a specific-gravity bottle?

How by means of a graduated tube?

How by immersing it in a liquid of the same specific gravity?

How is the specific gravity taken of a solid soluble in but heavier than water?

How is the specific gravity taken of a solid insoluble in but lighter than water?

How of a solid soluble in but lighter than water?

Describe a specific-gravity bottle.

Can an ordinary bottle be used for this purpose?

State how this can be done.

What are Lovi's or specific-gravity beads?

What is a hydrometer or areometer?

What two classes of hydrometers are there?

Describe Baumé's hydrometer.

What is the difference between the one for light liquids and the one for heavy liquids?

Why is the zero mark placed near the top in hydrometers for heavy liquids?

Describe the specific gravity scale hydrometer.

What is the object of having two bulbs blown in the glass at the lower end of the hydrometer?

Which is the more accurate for taking specific gravity,—the hydrometer or the specific-gravity bottle,—and why?

Which is more likely to give a correct indication of specific gravity,—a hydrometer having an elongated bulb with cylindrical sides, or one having an oval or globular bulb,—and why?

What is a urinometer, and how is it usually graduated?

What is the specific gravity of healthy urine?

What is the specific gravity of diabetic urine?

What is a saccharometer, and how is it graduated?

What is an elæometer?

What is a lactometer?

What does an alcoholmeter usually indicate?

Describe Tralles's hydrometer.

Describe Cartier's hydrometer.

Describe Gay-Lussac's centesimal alcoholmeter.

Describe Sikes's hydrometer.

Describe Jones's hydrometer.

Describe Dica's hydrometer.

Describe Twaddell's hydrometer.

Describe Beck's hydrometer.

Describe Zanetti's hydrometer.

Describe Fahrenheit's hydrometer.

Describe Nicholson's hydrometer.

Describe Mohr's specific-gravity apparatus.

Describe Gannal's method of taking specific gravity of a liquid.

How can a specific-gravity pipette be used to show specific gravity?

Describe Rousseau's densimeter.

What is specific volume?

How can you obtain the volume of a given weight of a liquid?

CHAPTER II

OPERATIONS REQUIRING THE USE OF HEAT.

Generation of Heat.

THE consideration of the theories which have been advanced from time to time to explain the phenomenon of heat, although very interesting and instructive, cannot be treated of in a work of this character, and the reader is therefore referred to any of the recent works on physics, which are everywhere accessible. The view which is now almost universally accepted is that known as the dynamical theory of heat, in which it is assumed that heat is produced by the constant motion of the particles composing the body, and that heat varies in quantity and kind according as the body is *solid*, *liquid*, or *gaseous*.

It will be convenient to consider the various practical operations and appliances for generating heat under three heads :

1. Operations and forms of apparatus in which *solids* are used in developing heat.
2. Those in which *liquids* are used in developing heat.
3. Those in which *gases* are used in developing heat.

OPERATIONS AND FORMS OF APPARATUS IN WHICH SOLIDS ARE USED IN DEVELOPING HEAT.

Kinds of Fuel.—Under this head is included the very well known employment of solid fuel, as wood, charcoal, anthracite coal, bituminous coal, coke, etc.

Wood is seldom relied upon as fuel in pharmaceutical operations where a regular, well-sustained heat is desired, yet from its wide distribution, ready inflammability, and comparative cheapness it is indispensable in kindling a fire. The large quantity of unconsumed carbon which is either lost in smoke or deposited upon vessels that are being heated constitutes the chief objection to its use.

Charcoal is more convenient, although more costly, than wood : it ignites easily, burns readily, and leaves but little residue. On account of its ready combustibility, it is well fitted for operations requiring a quick, strong heat.

Anthracite coal is probably the best form of solid fuel for general use, being the most economical : its hard, dense structure renders it difficult

to kindle, but where a long-continued, strong heat is desired it is to be preferred.

Bituminous or *semi-bituminous* coal affords a strong heat, but it is not equal to anthracite as fuel for pharmaceutical purposes. Unconsumed carbon is found in the smoke in large quantity, and this is apt to condense on the surfaces of kettles, vessels, etc., which are being heated, and the deposits of soot are uncleanly and often difficult to remove.

Coke, the residue obtained from the distillation of coal at gas-works, is an excellent fuel, and may be used either mixed with coal or by itself: it is more easily kindled than anthracite.

Pharmaceutical Furnaces, etc.—Much ingenuity has been used in the contrivance of various forms of furnaces, ranges, stoves, etc., to

meet general or special applications, yet in all there are certain fundamental principles of construction which must be well understood if faults are to be avoided. The elements of a furnace are the *air-flue*, *combustion-chamber*, and *vent* or *chimney*, and the relative proportions of these must depend upon the special object sought in the construction of the furnace, and the character of the fuel that is to be used. Fig. 57 represents a sectional view of a pharmaceutical furnace,—C being the air-flue, A the combustion-chamber, and B the vent.

Coal being the principal solid fuel in use, it will be most appropriate to treat of those furnaces adapted for its combustion, and therefore the chemical constitution of coal and the theory of its combustion must be noticed. Hard anthracite, which is the best kind of coal for pharmaceutical furnaces, usually has a specific gravity of 1.550, and has been shown to consist of 94 per cent. carbon, 0.40 per cent. hydrogen, and 1.26 per cent. oxygen; there are also apt to be present 2 per cent. of water and about 2.3 per cent. of incombustible impurities or ash, consisting of ferric oxide, silica, alumina, magnesia, lime, etc. The poorer grades of this kind of coal contain from 85 to 90 per cent. of carbon. Anthracite may be distinguished from other varieties by its rich, glassy lustre, its peculiar conchoidal fracture, and its hard, dense structure: it burns freely, without black smoke, showing the absence of unconsumed carbon. Soft anthracite or *semi-bituminous* coal has a tendency, when broken into pieces, to assume the form of irregular cubes, and to crumble easily when pressed: it burns freely, but with the production of large quantities of black smoke. The heat produced by its combustion is very strong, and it is largely used in many parts of the United States.

The combustion or oxidation of coal requires the presence of a certain quantity of air in contact with the burning coal to furnish enough oxygen to combine properly with the carbon of the fuel. The result of the combination is carbon dioxide, CO_2 , and carbon monoxide, CO , both of which are gases. It is very important to provide means of escape for these gaseous compounds, as they are both poisonous, and the former is a decided non-supporter of combustion. Theoretically, it has been calculated that one hundred and fifty cubic feet of air are necessary to

consume perfectly one pound of coal in an ordinary furnace, but practically, because of the obstruction of the ashes, which prevents the thorough contact of the air with all parts of the glowing carbon, nearly double this amount is necessary.

Stoves and ranges are now so universally used that it would be needless to multiply illustrations of them: the proper selection of such as are suited to the special uses of the pharmacist must be left to individual decision, and will depend upon the space that can be spared and the character of the work that is to be done. One important feature should not be overlooked, however, in this connection,—*i.e.*, the addition of a boiler

or water-back, whereby a constant supply of hot water can be had: where stoves are used, this can generally be effected by having a circulating hot-water boiler in a convenient corner, the pipes conveying the hot water being heated in the upper part of the combustion-chamber of the stove. If sufficient space can be appropriated, a range is very useful, particularly if a sheet-iron sliding-door can be lowered over the front to enclose the space. Now, when a communicating flue, controlled by a damper, is made to enter the chimney from the top of this space, operations can be conducted here that would otherwise be impossible, noxious vapors being at once carried off by the flue. Fig. 58 represents an ordinary range which is well adapted for many pharmaceutical operations. The front has been removed, in order to show the construction more clearly. This front is of sheet iron, and is hinged to the shelf which supports the boiler; it

FIG. 58.

Pharmaceutical range.

extends half-way over the top of the range, and when the damper, F, is opened, the vapors arising from operations conducted on the top are carried up the chimney. The hot-water boiler, B, is connected by pipes, G, with the cold-water supply in such a manner that the cold water circulates through pipes which surround the combustion-chamber, and, after becoming heated, ascends into the boiler.

Fig. 59 shows a durable pharmaceutical furnace made by Mershon's Sons, which has proved very useful in practical work. The body of the furnace is of wrought iron; it is lined with fire-brick, and the top is composed of a series of rings, which permits of the use of various-sized kettles, evaporating-dishes, etc. It has two cast-iron doors, the upper one being especially useful, as it permits the ready feeding of coal to the furnace whilst a kettle or dish is being heated, without disturbing the

latter. Fig. 57 affords a sectional view of the same furnace; and it will be noticed that the combustion-chamber, A, is sufficiently deep to contain

FIG. 59.

Pharmaceutical furnace.

a considerable body of ignited coal and permit the introduction of hot-water pipes. The proportion of the air-flue, C, is well arranged, whilst the vent, B, has sufficient capacity to serve all pharmaceutical purposes.

The merits of this furnace are that the greater part of the heat rises and is available for heating the vessel placed on the rings, the heavy lining of fire-brick preventing lateral radiation to a great extent, and that, while it has all the advantages of a stationary furnace, its position can be changed repeatedly if desired, the relative proportion being so well adjusted that, whilst it is very sensitive to an increase or decrease of draught, a moderate heat may be as steadily maintained as the intensity of a strong fire.

A drying-closet can be adapted to this stove by which the waste heat may be utilized. This will be described in the chapter on desiccation.

OPERATIONS AND FORMS OF APPARATUS IN WHICH LIQUIDS ARE USED IN DEVELOPING HEAT.

The liquids which are most used in pharmaceutical operations for heating are alcohol, petroleum, or coal oil, and benzin, or gasolin. All of these liquids contain carbon and hydrogen, whilst alcohol contains thirty-four per cent. of oxygen in addition.

Alcohol burns with a blue flame, which does not deposit soot, and the heat produced is intense. It is in many respects the best liquid to use

FIG. 60.

Spirit-lamp.

for generating heat in small operations, but the expense attending its use in this country is a serious objection; for this reason it is more economical to use a glass spirit-lamp, which is provided with a ground-glass cap (see Fig. 60), than an extemporaneous lamp made from an ordinary bottle: in the latter the loss by the evaporation of the alcohol from the wick, which is exposed when the lamp is not in use, is considerable. The older forms of alcohol-lamps, such as Berzelius's, Mitchell's, etc.,

have almost gone out of use, being superseded by improved forms.

Fig. 61 shows one of the simplest of these very convenient spirit-lamps. L represents the lamp, S the support, and C the cover. Alcohol is poured upon the brass-wire gauze, which sinks into and is absorbed by the asbestos, or mineral wool, with which the body of the brass disk is filled; a lighted match is now applied to the gauze, which retains sufficient spirit to ignite, and a strong heat is at once obtained, the large extent of surface of the gauze producing a solid blue flame. The great advantages of spirit-lamps of this kind are that, all parts being of metal, accidents from breakage are avoided, whilst explosions cannot occur, as neither the alcohol nor its vapor is confined in a tight receptacle, and if the lamp is upset accidentally no spirit can be spilled, because it is absorbed by the asbestos. The stand, S, is hinged in the centre, and the cap, C, fits tightly on the lamp, so that loss by evaporation is prevented when not in use: all the parts of the lamp fit into a box, which may be readily carried in the pocket. Many modifications of this simple contrivance have been introduced which are elaborate and useful, but want of space prevents further notice.

The so-called Russian blast-lamp is one of the best contrivances for generating an intense heat: it is useful when glass tubes of large diameter are to be bent, or in crucible operations. A sectional illustration is seen in Fig. 62. It is made of sheet copper, and consists of a partially-jacketed cylinder, A, with an opening on one side for introducing the

FIG. 61.

Metal spirit-lamp.

FIG. 62.

Russian blast-lamp.

alcohol, and on the opposite side a bent, tapering tube, B, which pierces the cylinder below the jacketed portion, and is turned upward as shown in the cut. The principle of action is that of the combustion of the vapor of the spirit. If sufficient alcohol is poured into the lamp through the side opening to half fill it, the cork loosely inserted, and half a fluidounce of alcohol poured into the large opening at the top, and then a lighted match dropped into it, the heat from the burning alcohol in the bottom of the lamp causes the alcohol contained between the jacketed sides to boil, and the vapor, having but one means of escape, rushes out by the tapering, bent tube, and at once ignites and produces a powerful

upward blast. The flame, C, may be at once extinguished by putting the cover, D, over the central opening.

Benzin, or *Gasolin*, is now used for heating purposes, and Fig. 63 shows one of the most convenient stoves for employing this cheap but very volatile hydrocarbon. The difficulties in the use of the very inflammable and often dangerous liquids of this class for heating have been here largely overcome: to avoid a smoky, luminous flame the *vapor* is burned in contact with air, whilst to prevent explosions the reservoir for the liquid is elevated and placed four or five feet away from the ignited vapor. Fig. 63 shows the stove, and Fig. 64 an enlarged view of the burner. The reservoir, G, is filled with gasolin, care being taken at the same time to see that the valve F is closed. When the burner

FIG. 63.

Gasolin stove.

is to be lighted, the valve F is opened slightly, and the valve D turned very carefully, so that a small quantity of gasolin shall flow from B over the sides and collect in the cup, C. When C is full, both valves, F and D, are turned off, and a lighted match applied to C; the burning gasolin will heat the burner, A; and when all of the liquid in C has been burned and the flame extinguished, the valve D

FIG. 64.

Gasolin stove burner.

is turned on slightly and a lighted match applied at A; the parts surrounding B being hot, the gasolin is vaporized, and passing upward through the burner, A, issues through the numerous circular openings and is ignited; the upward current of air caused by the heat mixes with the gasolin vapor and supplies the oxygen necessary to produce a perfectly blue and intensely

hot flame, the size of which is regulated by the valves D and F. When fairly ignited, F is slightly opened, and D is used to control the flame by turning to the right or left.

Although this stove is safe in careful hands, the volatile and very inflammable character of the hydrocarbon must be constantly borne in mind. In a large laboratory in the southern part of Philadelphia these

burners are exclusively used, an elevated tank in the yard supplying the gasolin to the gas-pipes, which are conveniently laid around the sides of the room and communicate with the burners on the tables.

Kerosene, or *Coal Oil*, is so widely known as a refined petroleum product used for illuminating and heating purposes that any extended notice of its properties in a practical work would be superfluous; as it is heavier in specific gravity and has a much higher flashing-point¹ than gasolin, it is much safer for popular use. A pharmaceutical stove in which coal oil can be burned with a blue flame safely, and without the use of wicks, is yet to be contrived. There are a great many stoves to

be had which are wick-burners, but these are often unsatisfactory: they are largely used, however, notwithstanding their inconveniences. Fig. 65 shows one of the best forms of this class. It is made by Adams & Westlake. The oil is poured into a reservoir in the base of the stove, the upper part is surrounded with perforated tin, which admits air to the flame and acts as a protection; the wicks, which are flat and wide, have corresponding chimneys, by which the heat is conveyed to the vessel that is to be heated. The disadvantage common to all coal-oil stoves using wicks is that the chimneys have to be high enough to secure perfect

Coal-oil stove.

combustion and prevent smoking, and this removes the vessel that is to be heated so far from the flame that quick heating is almost impossible; in addition to this, the wicks require constant attention, and imperfect combustion frequently results even when care is exercised. In sections of our country where gas cannot be had, they are, however, indispensable, and are the most convenient generators of heat attainable.

OPERATIONS AND FORMS OF APPARATUS IN WHICH GASES ARE USED IN DEVELOPING HEAT.

Gas.—The extensive employment of manufactured illuminating gas and the growing use of natural gas as sources of heat for pharmaceutical and other purposes render necessary a somewhat extended notice of gas in this connection. Illuminating gas is frequently called carburetted hydrogen, but it is really a mechanical mixture of various gases, some of which produce luminous flames and others do not; besides the hydrocarbon, CH_4 (carburetted hydrogen), which is the principal constituent,

¹ By this term is meant the temperature at which coal oil begins to give off inflammable vapor.

it contains condensible hydrocarbons, hydrogen, carbon dioxide, carbon monoxide, aqueous vapor, and traces of oxygen and nitrogen. Gas is usually produced by the destructive distillation of gas-coal, whilst coal-tar, gas-liquor, and coke are the liquid and solid by-products, and these are now exceedingly useful as the sources of valuable manufactures in the arts. Gas which is fitted for illuminating purposes must have its composition modified by admixture with air before it is fit for heating purposes; this may be best illustrated by the examination of an ordinary fish-tail gas-flame. In Fig. 66 it will be noticed that three zones are visible,—B, the dark central zone, which is not luminous and not at all

FIG. 66.

Gas-flame.

FIG. 67.

Bunsen burner (sectional view).

hot, because the gas is not fairly ignited; A, the luminous zone, where the emission of light is due to the suspension of minute particles of incandescent carbon in the flame, caused by the incomplete combustion of the gas; C, the outer non-luminous zone, the "mantle" which fringes the flame and where the particles of carbon coming in direct contact with the air are entirely consumed, the commonly accepted theory being that the oxygen in the air unites chemically with the incandescent carbon-particles, producing the invisible gases carbon monoxide and carbon dioxide.

Soon after gas came into use it was discovered that the properties which rendered it most valuable as an illuminator prevented its use as a source of heat, because of the deposition of the particles of soot from the luminous portion of the flame upon vessels that were to be heated. Dr. Duncan, of Edinburgh, showed that if gas properly mixed with air was made to enter at the bottom of a tall tinned iron cylinder, the upper end of which was covered with wire gauze, it would burn when ignited above the gauze with a blue, smokeless flame. The unnecessarily long cylinders (sometimes thirty inches) which were originally used were soon replaced by others of the length of five or six inches, for the sake of greater convenience. This discovery was at once utilized, and gas stoves and burners for various purposes came into use immediately.

Bunsen burners are more frequently used in simple operations than any other form (see Fig. 67). The coal-gas issues from a small orifice, O, near the base, passes up through a brass tube, H, four inches high, and is ignited at the top of this tube; four large circular openings surround the small orifice at the base, and these may be closed either wholly or in part by a perforated brass ring, R; this permits the regulation of the supply of air, which mixes with the gas as it ascends the tube, and a blue, smokeless, intensely hot flame may be produced; if the perforated ring is turned so that the air-openings are closed, a luminous, smoky flame results. One of the objections to the ordinary Bunsen burner is that, after being used for a time under a low gas-pressure, when

the tube becomes hot the flame will sometimes recede and the gas become ignited at the lower orifice: this may usually be avoided by gradually turning the brass perforated ring, so as to admit less air to suit the diminished pressure. Prof. Morton corrects this receding of the flame by contracting the orifice of escape at the top to about two-thirds of the area of the tube (see Fig. 68). That the length of the

FIG. 68.

Bunsen burner (Morton's).

FIG. 69.

Short burner.

FIG. 70.

Short burner, with support.

perpendicular tube does not materially affect the smokeless character of the flame may be proved by the use of the convenient little burners shown in Figs. 69 and 70. These are made by the Buffalo Dental Manufacturing Company, and have proved very useful at the prescription counter. Bunsen burners with the tube arranged horizontally have

FIG. 71.

Fletcher's radial burner.

FIG. 72.

Horizontal Bunsen burner.

grown in favor because they are less likely to be overturned, and if they have a broad base they will easily support a large vessel. Fletcher's

radial burner (see Fig. 71) has the merit of having no loose parts, and, as the casting is well annealed, it is well adapted for rough usage, the gas issuing from narrow slits cut radially in the raised circular burner; the flame is solid and non-luminous: no gauze is needed to distribute the heat. In Fig. 72 is shown a very compact and useful gas-burner, well adapted for the dispensing counter, made by Bullock & Crenshaw; it is of the horizontal Bunsen type, and is furnished with an attachment for distributing the flame, and three short legs for supporting the vessel that is to be heated.

In many localities outside of cities and towns, gas made by vaporizing gasolin and mixing air with it is used for illuminating purposes. It is made by gas machines, as they are termed, the air-pump, operated by weights and pulleys or by a water-wheel, being usually located in the cellar of the residence or building, whilst the gasometer is buried underground at a safe distance. This gas is very satisfactory, but it has been only within a few years that it has been utilized for heating purposes. Special burners are required when this gas is used as an illuminant, and they require some adjustment at first to secure the proper proportion of air. Fig. 73 shows the Springfield laboratory burner, which gives a very hot, blue flame with this kind of gas, and it may also be used with ordinary gas. The milled head at the base of the burner is used to control the quantity of the gas passing through, whilst by revolving the burner itself upon the thread of the screw by which it is connected with the base the quality of the gas is determined,—i.e., the proper proportion of air is admitted.

Gas stoves are now made in such variety that it seems difficult to make a judicious selection for general pharmaceutical work: the error most frequently made is in the choice of those which are intended to produce only

FIG. 73.

Springfield laboratory burner.

FIG. 75.

Water-heater.

FIG. 74.

Economy furnace.

very high temperatures. It is very seldom that a heat of great intensity is desired in pharmaceutical operations. The chief points to be secured

in a good gas stove are—1, a smokeless flame; 2, a strong, firm, indestructible frame that will easily support a large or small vessel and is not easily overturned; 3, an easy and quick adjustment, whereby either a strong, well-sustained heat or a low, diffused heat may be obtained. Prof. Parrish devised a pharmaceutical stove which had these qualifications, but it is not made at present. Fig. 74 shows the gas stove known

FIG. 76.

Hot-water generator.

in commerce as the Economy furnace. It is made by the American Meter Company, and of all of the gas stoves that have been used by the author, this is the one which is in every way most suited for pharmaceutical operations. It has a broad, low, strong base, and cannot be easily overturned, and a double ring burner, so arranged that either the small ring or both the small and large rings may be used. As it is only about four inches high, when placed upon the laboratory counter a vessel which is upon it and being heated is not elevated so that it cannot be conveniently stirred. It is nine inches square, and its consumption of gas when both rings are lighted is ten feet per hour.

One of the greatest conveniences that a pharmacist can have at a dispensing counter, where a large supply of hot water cannot be had from a boiler, is the water-heater shown in Fig. 75. If hot water is desired, the pipe at the top is connected with a hydrant, the water turned on, and the gas-burner lighted below; in a few seconds warm water, and in a minute or two hot water, will run from the lower pipe. Fig. 76 shows a convenient hot-water generator, well adapted for furnishing a supply of hot water in pharmacies which have not access to the water back of a range, but can use gas. It is shown in the illustration attached to an ordinary circulating boiler, and it can be depended upon to furnish a large quantity of warm water. It is made by the American Meter Company.

The advantages of the use of illuminating gas as a source of heat may be summed up as follows: 1. It may be made to furnish a clean, smokeless flame. 2. It is cheap when compared with alcohol and other sources of heat, and is particularly economical in large cities. 3. The supply is unremitting, and the inconvenience of continually supplying fuel, which is always present in other forms of stoves, is not experienced here. 4. The supply is under almost perfect control, and, after once regulating the flow suitable for a continuous operation, little apprehension need be felt, during the operator's enforced absence, of an injurious rise or fall in the temperature.

METHODS OF MEASURING HEAT.

To measure degrees of temperature in pharmaceutical operations thermometers are used exclusively. A thermometer may be described as an instrument consisting of a glass tube having a capillary bore, with a cylindrical or globular bulb blown at the end, the bulb and a part of the stem containing a liquid (usually mercury), and the tube being mounted upon a graduated scale, or the tube itself graduated, in order to measure the degree of expansion of the liquid when subjected to the influence of heat. Unfortunately, the value of the degrees of thermometers in common use is not the same, there being no less than three arbitrary scales,—Centigrade, Fahrenheit, and Réaumur, the latter rarely used.

The *Centigrade*, or Celsius's, scale is best adapted for scientific work; it is given the first place in the U. S. Pharmacopœia, 1890. The freezing-point of water is zero, 0° , and the boiling-point is 100° ; the intervening space is divided into one hundred equal parts (see Fig. 78).

The *Fahrenheit* scale is much the most largely used in this country and Great Britain, and until the 1880 revision of the U. S. Pharmacopœia it was used exclusively in pharmacy. The Centigrade degrees in the Pharmacopœia are followed by those of Fahrenheit enclosed in parentheses, as 100° C. (212° F.). In Fahrenheit's thermometer the freezing-point is 32° , and the boiling-point is 212° , the intervening space being divided into one hundred and eighty equal parts (see Fig. 79). In Réaumur's thermometer the freezing-point is 0° , and the boiling-point is 80° .

In Figs. 81, 82, and 83 the three thermometers are shown together to facilitate comparison: the lowest figures indicate the freezing-points of each, the highest the boiling-points.

Rules.

1. To convert Centigrade degrees into those of Fahrenheit, multiply by 1.8 and add 32.

2. To convert Fahrenheit degrees into those of Centigrade, subtract 32 and divide by 1.8.

Choice of Thermometers.—It is important that the practical pharmacist should possess a good thermometer. The best form is one in which the graduations are made on the surface of the tube. The diameter of the instrument should be the same throughout its entire length; this permits its convenient use through perforated corks in distillations and other operations where it is necessary to observe temperature,

and it is not so easily broken (see Fig. 79). The thickness of the glass of the bulb is not a matter of indifference: if too thick, the thermometer will not respond quickly to changes of temperature, whilst if too thin, the risk of fracture is very great. The bore of the tube should be flat or elliptical, and perfectly uniform throughout. The absence of air in the tube may be known by the descent of the mercury to the lowest part of the tube when the

Fahrenheit thermometer.

FIG. 80.

Paper-scale thermometer.

FIG. 81.

Fahrenheit thermometer.

FIG. 82.

Centigrade thermometer.

FIG. 83.

Réaumur thermometer.

thermometer is inverted. A strip of opaque, white enamelled glass behind the bore of the tube is of great assistance in reading the indication

quickly. A cheaper thermometer, which will answer for many purposes, has a paper scale inside of a glass tube (see Fig. 80). These should not be used for temperatures over 300° F., as in time the paper becomes charred. It is a good practice to send a thermometer to be officially tested,¹ and then to reserve it as a standard for correcting ordinary instruments. As glass usually reaches its limit of contraction in three years, such a thermometer should be at least this old before it is sent.

Table of Melting-Points of Official Substances.

Acidum Aceticum Glaciale	15° C.	=	59° F.
Oleum Theobromatis	30°-33° C.	=	86°-91.4° F.
Sodii Carbonas	32.5° C.	=	90.5° F.

QUESTIONS ON CHAPTER II.

OPERATIONS REQUIRING THE USE OF HEAT.

According to the dynamical theory, how is heat produced?

What solids are commonly used as fuels in developing heat?

What is the objection to using wood as a source of heat in pharmaceutical operations?

Is charcoal more or less convenient, and why?

What advantage has anthracite coal?

What is the objection to bituminous coal?

How is water heated in an ordinary range?

What liquids are used for heating purposes in pharmaceutical operations?

What objection is there to the use of alcohol?

What is the arrangement of the so-called Russian blast-lamp?

How may benzine or gasoline be burned without danger from explosion?

Is kerosene or coal oil safer than gasoline? If so, why?

Does coal oil require a wick to burn satisfactorily?

What is the disadvantage of using a wick?

Of what does ordinary illuminating gas consist? How is it produced?

What valuable liquid and solid by-products are obtained in process of manufacture?

Give an explanation of the three zones that are apparent in an ordinary gas-flame.

How may ordinary gas be burned so as to become a source of heat rather than of light?

What is a Bunsen burner?

What is the objection to the ordinary Bunsen burner?

How may this be obviated?

How does the length of the perpendicular tube affect the smokeless character of the flame?

Describe Fletcher's radial burner.

What are the chief points to be secured in a good gas stove?

Describe the Economy furnace.

What are the chief advantages in this stove?

What are the advantages of the use of illuminating gas as a source of heat?

In pharmaceutical operations, how are degrees of temperature measured?

What is a thermometer?

What three scales of degrees of heat for thermometers are used?

Which is most largely used in this country?

Which is used in the U. S. Pharmacopœia?

What are the freezing- and boiling-points of Fahrenheit's scale?

How is the intervening space divided?

What are the freezing- and boiling-points of the Centigrade scale?

How is the intervening space divided?

What are the freezing- and boiling-points of Réaumur's scale?

How is the intervening space divided?

How may Centigrade degrees be converted into those of Fahrenheit above 32?

How may Fahrenheit degrees above 32 be converted into Centigrade degrees?

What are the essential points of a good thermometer?

Convert — 18.72° C. into F.

CHAPTER III.

USES OF HEAT.

THE consideration of the uses of heat in pharmacy will follow naturally the preceding chapter upon its generation and measurement, and the subject may be properly treated of under two classes,—viz.: 1, those operations in which comparatively high temperatures are required, and, 2, those which require moderate or low temperatures. It will be readily noticed that the latter class will embrace nearly all of the more important pharmaceutical operations in which heat is employed.

Operations in which comparatively High Temperatures are required.—In this class of operations must be placed some which seem to be in danger of becoming lost arts through the growth of special methods, which are now conducted on a large scale by manufacturers, who supply the products of their skill so cheaply that the home-made apparatus is often produced at a pecuniary loss. It will, nevertheless, be found useful to refer briefly to these operations, for a certain amount of knowledge will frequently be of service to the practical worker in emergencies and on special occasions.

The Use of the Blow-Pipe.—A blow-pipe in its simplest form is a metallic tube, usually of brass or copper, slightly conical, gradually tapering to a minute orifice, the narrowest portion being curved so that the axis of the orifice is at right angles to that of the principal portion of the tube. It is used by placing the widest end in the mouth, and inserting the other end into the edge of the flame, and forcing a current of air through the tube, with the effect of increasing the intensity of the flame by converting it into a miniature blast. Some skill and practice are required to produce an unremitting current of air, and this is effected by keeping the muscles of the cheeks distended and constantly supplying air from the lungs as it is needed. When the blow-pipe is used with a luminous flame, the interior of the flame, owing to the carbon not being wholly oxidized, has the power of deoxidizing or reducing oxides, whilst the outer flame has opposite or oxidizing properties: a piece of lead glass tube held in the inner flame will be blackened through the reduction of the lead oxide to the metallic state; if this stain is held in the outer flame the metal is reoxidized, dissolves in the glass, and the glass again becomes transparent. The blow-pipe is useful in pharmacy in working and bending glass, in testing fusible chemical substances, in soldering apparatus, etc. The various forms of blow-pipes in common use are shown in Figs. 86 to 91.

The Fletcher's gas blow-pipe, shown in Fig. 92, furnishes an excellent and very powerful blast which is capable of delicate adjustment. It

has a universal ball-and-socket joint, which enables it to be used in any position. The very convenient foot-bellows, shown in Fig. 93, may be used in connection with it for producing the blast. The sides of this

bellows are of stout leather, and the reservoir of air beneath is obtained by stretching and fastening a circular piece of thin rubber cloth over the lower orifice and preventing too great expansion and rupture by enclosing it in a net: this form, with the reservoir below, is preferable to that formerly in use, which had the rubber cloth above; the advantages are greater protection against injury from falling

FIG. 92.

Gas blow-pipe.

FIG. 93.

Foot-bellows.

articles, and less obstruction to the valves through sucking in dust from the floor.

Crucible Operations.—A crucible is a cup-shaped vessel made of platinum, silver, black lead, iron, porcelain, wedgwood-ware, or clay, and intended to withstand a very powerful heat. It is used for fusing metals or heating metallic oxides or organic substances, and is very useful in chemical analysis. The Hessian crucible (see Fig. 94) is the cheapest: it is unfitted for delicate operations, for, although capable of withstanding great heat, its porous character permits the ready absorption of many substances. The black-lead crucible is more expen-

sive: it is less porous, is infusible, and has the great merit of bearing great changes in temperature without risk of fracture. Porcelain or wedgwood crucibles are fragile, and have to be very gradually cooled to prevent breakage. Fletcher's gas crucible furnace (see Fig. 95) is very useful in this connection. Of the metals used in making crucibles,

FIG. 95.

Crucible furnace.

FIG. 94.

Hessian crucible.

FIG. 96.

Platinum crucible.

platinum is superior to any: its well-known power of resisting fusion, its cleanliness, and its non-liability to be acted upon by most chemical substances render it invaluable to the chemist, notwithstanding its costliness (see Fig. 96).

The following processes require the application of high heat:

1. *Ignition*, in the sense in which it is used in the Pharmacopœia and by chemists generally, is the process of strongly heating solid or semi-solid substances, the residue left at the conclusion of the process being the object sought. The U. S. 1890 quantitative tests for potassium bitartrate, sodium benzoate, and purified antimony sulphide afford examples of the use of this process.

2. *Fusion* is the process of liquefying solid bodies by the application of heat without the use of a solvent: the melting of wax, and the preparation of moulded silver nitrate, are familiar examples of this process.

3. *Calcination* is the process of separating volatile substances from fixed inorganic matter by the application of heat without fusion: its principal application in pharmacy is in the expulsion of water and carbonic acid from carbonates, as shown in the processes for making magnesia, lime, etc.

4. *Deflagration* is the process of heating one inorganic substance with another capable of yielding oxygen (usually a nitrate or a chlorate); decomposition ensues, accompanied by a violent, noisy, or sudden combustion. Deflagration is used in making some of the salts of antimony and arsenic, and in some qualitative analytical examinations.

5. *Carbonization* is the process of heating organic substances *without* exposure to air until the volatile products are driven off, and the residue assumes the black color characteristic of free carbon or charcoal. The manufacture of bone-black and wood charcoal affords good illustrations.

6. *Torrefaction* (known also as roasting) is the process whereby organic substances have some of their constituents modified by the application of a degree of heat somewhat less than that necessary to carbonize them. The most familiar example of this process is the roasting of coffee. Rhubarb in coarse, dry powder, when subjected to this process, loses its cathartic properties, but retains its astringent qualities, and is known as *Torrefied Rhubarb*.

7. *Incineration* is the process of heating strongly, organic substances with access of air until all the carbon is consumed, the ashes which remain being the object sought. The process is frequently used in analysis to determine the amount of fixed matter in an organic substance.

8. *Sublimation* is the process of separating a volatile solid substance from one which is not volatile by the application of heat. A special chapter on this subject will be found in the succeeding pages.

OPERATIONS REQUIRING HEAT IN WHICH LOWER TEMPERATURES ARE USED.

In this class of operations will be found the most important of those requiring the application of heat; almost all medicinal substances have their properties altered by the action of heat, and many cases are met with where it is necessary to moderate carefully the heat in order to prevent the decomposition or destruction of the active agent; for the purpose of controlling heat various baths are used, as the sand-bath, oil-bath, solution-bath, steam-bath, water-bath, etc.

The sand-bath is usually an iron vessel of hemispherical or other convenient shape, containing dry, clean sand (see Fig. 97); the vessel to be heated is embedded in the sand, and the bath is then heated to the required degree. The object of this form of bath is to equalize the temperature, and to prevent a too sudden rise or fall of heat whereby unequal expansion or contraction might cause fracture to a glass or porcelain vessel being heated. Iron-wire clippings have sometimes been substituted for sand, with doubtful advantage, however.

The practical error usually made by inexperienced operators in the use of the sand-bath is in permitting too large a body of sand to rest between the bottom of the vessel to be heated and the flame; this results in an unnecessary waste of heat.

The oil-bath is designed to furnish a regulated temperature below 260° C. (500° F.). A fixed oil is the medium usually employed for communicating the heat, but one of the best substitutes for oil is petrolatum. Most fixed oils, when heated above 177° C. (350° F.), evolve disagreeable fumes.

In fractional distillation on a large scale, oil-baths are often used to control temperature, and the fumes arising from the heated oil are carried off by a pipe to the chimney.

The glycerin-bath.—In order to avoid the disagreeable odors arising from hot oil, glycerin is sometimes substituted. Acrolein, an acrid, volatile product, however, is produced if glycerin is heated nearly to

FIG. 97.

Sand-bath.

boiling. A temperature of 250°C . (482°F .) can be maintained in a glycerin-bath without much inconvenience.

Salt-water baths are sometimes used in special operations; their principle of action depends on the fact that the boiling-point of a liquid is raised in proportion to the quantity of fixed salt dissolved in it. Water, as is well known, boils at 100°C . (212°F .), but if common salt is dissolved in water until it ceases to take up any more, and a saturated solution is produced, it is found that this solution does not boil until the temperature of 108.4°C . (227.1°F .) is reached. The following table shows the boiling-point of certain saturated solutions as determined by Legrand and others:

Table of Boiling-Points of Saturated Solutions of various Salts.

SALT.	Boiling-Point.		SALT.	Boiling-Point.	
	C.	F.		C.	F.
Sodium Chloride	108.4°	227.1°	Sodium Acetate	124.4°	256°
Ammonium Chloride	114.2°	237.6°	Potassium Carbonate	135°	275°
Potassium Tartrate	114.7°	238.5°	Calcium Nitrate	151°	303.8°
Potassium Nitrate	115.9°	240.2°	Potassium Acetate	169°	336.2°
Sodium Nitrate	121°	249.8°	Calcium Chloride	179°	354.2°

The *water-bath* is one of the most useful of all the forms of pharmaceutical apparatus for regulating temperature, and the frequency with which it is directed to be used in works of authority indicates its importance as a necessary implement in the equipment of every pharmaceutical laboratory. Almost all the water-baths used by pharmacists are extemporized, and these are generally crude and inconvenient; two dishes usually suffice, one of them somewhat larger

FIG. 98.

Water-bath.

in diameter than the other. Water is poured into the larger dish, and the other dish, containing the liquid to be heated, is placed in the water and the heat applied; the room is soon filled with the escaping steam, and in winter the condensation of the moisture upon the windows is alone a sufficient inconvenience to render it undesirable. Fig. 98 shows a tinned copper water-bath in which

this annoyance is overcome. The water-level has at its lowest point a piece of block-tin tube soldered in; this extends half-way up the glass tube in the inside, whilst a perforated cork at the upper end of the glass tube permits the insertion of another piece of block-tin tube; the upper

tube connects with the cold-water faucet and terminates in the smoke-flue or with the outside air; the vapor arising from the boiling water either passes off into the chimney, as shown by the arrow, or is condensed, the loss being supplied by a small stream of water from the cold-water faucet, shown by the arrow pointing downward; the lower block-tin tube acts as an overflow, the excess of water being carried off by a rubber tube into the sink; all possibility of the water-bath "boiling dry" is thus obviated. Vapors from the liquid in the water-bath may be carried off by a hood (see Fig. 129). A simple water-bath may be made by encasing a tinned-copper round-bottomed dish in one of larger diameter having a flat bottom. Water is poured in through a tubulure in the top, and it is replenished as required. Fig. 99 shows a similar water-bath, a porcelain evaporating dish taking the place of the copper one. It is useful where a metallic dish would be acted on by the substance to be

FIG. 99.

Water-bath (porcelain dish).

FIG. 100.

Water-bath (copper ring).

heated. A water-bath intended for the smaller operations of analytical chemistry is shown in Fig. 100. The different sizes of the rings render it convenient for vessels of various shapes and sizes. It will be necessary to allude frequently hereafter to the uses and modifications of the water-bath.

THE USE OF STEAM IN PHARMACEUTICAL OPERATIONS.

The scope of this work will not permit of any extended consideration of the use of steam in technical pharmacy, yet it is of vital interest to be acquainted not only with the theories underlying its employment, but also with the apparatus used in its practical application.

When water is heated to the boiling-point and steam is produced, a certain amount of heat is absorbed (or apparently lost): this has been termed *latent heat*. When steam comes in contact with surfaces having less heat than itself, it is condensed, water is produced, and the latent heat becomes *sensible* (or reappears), thus proving the well-established physical law that *when a liquid assumes the gaseous state, a certain fixed and definite amount of heat disappears; and, conversely, when a gas or vapor becomes a liquid, heat to a corresponding extent is evolved*. Watts has illustrated this as follows: "When water at 0° C. is mixed with an equal weight of water at 100° C., the whole is found to have the mean of the two temperatures, or 50° C. On the other hand, 1 part by weight of *steam* at 100° C., when condensed in cold water, is found to be capable of raising 5.4 parts of the latter from the freezing-point to the boiling-

point, or through a range of 100°C . Now, $100 \times 5.4 = 540$; that is to say, steam at 100°C . in becoming water at 100°C . parts with enough heat to raise a weight of water equal to its own (if it were possible) 540° of the Centigrade thermometer, or 540 times its own weight of water one degree of the same." When water passes into steam the same quantity of sensible heat becomes latent. A consideration of these facts in physics leads to the practical application of steam as a transmitter of heat, whereby heat from any source may be absorbed by steam and carried through suitable pipes to the vessel designed to be heated. If this vessel is filled with a cold liquid, the latent heat of the steam is rapidly communicated to the liquid, the steam is condensed, and the result is this most convenient and economical method of producing a temperature which is capable of being regulated with great exactness.

Steam-baths may be divided into two classes: 1, those in which steam is used without pressure; and, 2, those in which steam is used under pressure.

1. *The use of Steam without Pressure.*—In many cases open steam, as it is termed, is used (see Fig. 101). The pipe which conveys the steam from the boiler is conducted to the bottom of a hemispherical kettle, and the liquid to be heated is poured into a dish of larger diameter, which is placed upon the top; the steam is turned on, and as it condenses is carried off by the drip-pipe. A temperature of about 100°C . (212°F .) can usually be maintained by this method.

Sometimes the steam-pipe is conducted directly from the top into the liquid to be heated. A steam-distributor, as shown in Fig. 102, may be used at the end of the pipe near the bottom of the kettle; it is made by screwing a cross upon the end of the pipe, and an elbow to each arm

FIG. 101.

Open steam-bath.

FIG. 102.

Steam-distributor.

of the cross; the steam issues usually with some force from each elbow and effectually stirs up the liquid, and rapidly produces a uniform temperature in it. The principal disadvantages about using steam in this way are the noise at first produced by the contact of the hot steam with the cold liquid, and the increase in bulk of the liquid through the condensation of the steam.

2. *The use of Steam under Pressure.*—This is by far the most convenient method of using steam practically as a means of transmitting heat. It has been stated that steam produced in open and unconfined vessels, with the ordinary pressure of the atmosphere, has the temper-

ature of 100° C. (212° F.). If water is heated continuously in a boiler capable of withstanding pressure, the water is prevented from boiling by the pressure of its own vapor, and the temperature of the steam rises in proportion as the pressure increases. It is usually stated that the pressure of the atmosphere is 14.7 pounds to the square inch. The following table shows the increase in temperature of steam when the pressure exceeds that of the atmosphere. Of course the opposite effect is produced when the pressure is removed, and the water boils below the temperature of 100° C. (212° F.). (See vacuum apparatus.)

Table of the Temperatures of Superheated Steam.

PRESSURE.		Temperature of Steam.		PRESSURE.		Temperature of Steam.	
Pounds per Square Inch.		C.	F.	Pounds per Square Inch.		C.	F.
14.7		100°	212°	55		141.6°	287.1°
17		104.2°	219.6°	60		144.7°	292.7°
20		108.8°	228°	65		147.7°	298°
23		113°	235.5°	70		150.5°	302.9°
25		115.6°	240.1°	75		153°	307.5°
30		121.3°	250.4°	80		155.5°	312°
35		126.2°	259.3°	85		157.8°	316.1°
40		130.7°	267.3°	90		160°	320.2°
45		134.6°	274.4°	95		162.2°	324.1°
50		138.3°	281°	100		164.4°	327.9°

The principle of the use of steam under pressure is shown in the apparatus (see Fig. 103). It was designed by the author in 1872 to illustrate the subject practically upon the lecture-table. A cylindrical copper boiler, A, supported by a stout iron stand, is heated by a row of six

FIG. 103.

Use of steam under pressure.

Bunsen burners; water is forced into the boiler from the hydrant through a rubber hose attached to the pipe connected with the check-valve, H. The steam passes into the jacketed kettle, B, and is controlled by the

steam-valve, E, the exhaust steam and condensed water passing through the pipe controlled by the valve F.

An upright tubular steam boiler, suited to operations in the pharmaceutical laboratory, and a sectional view of the same, are shown in Figs. 104 and 105.

Prof. Patch has contrived a very convenient upright tubular steel boiler, shown in Fig. 106. It is covered with asbestos composition, which acts as a non-conductor of heat, and the source of heat is a large coal-oil

FIG. 104.

Steam boiler.

FIG. 105.

Steam boiler (sectional view).

stove; a conical coil of pipe serves to support a funnel when hot filtration is needed, whilst a safety-valve and steam-gauge assure safety. It is, of course, intended only for the laboratory of a retail druggist.

The usual form of steam kettle is shown in Fig. 107. A copper pan, tinned inside, having flaring sides to facilitate evaporation, is securely connected about midway from the bottom with another copper pan, both being riveted together. An opening for the steam-pipe is made in the jacketed side to admit steam, and at the lowest point of the bottom another pipe is attached to carry off the water which is produced by the condensation of the steam. The upper edge of the kettle is protected by a flat brass ring, which is soldered and riveted to it, and which also

serves to support the still-top when the steam kettle is used for distillations. (See chapter on distillation.) Care should be exercised to have the bottom of the kettle made of copper heavy enough to resist the greatest amount of steam-pressure that will be likely to be used on it, as instances have been known of collapse when this was neglected. In using the steam kettle, the liquid that is to be heated is run into it by a syphon or other means; the drip- or exhaust-cock below is opened partially, and the steam slowly turned on. The habit of opening steam-valves cautiously is one that should be sedulously cultivated, as accidents and strains to steam apparatus often arise from the sudden shocks due to want of care in this respect. While the liquid is becoming heated, the condensed water should be allowed to escape freely, and when the proper temperature is reached, the steam-valve should be carefully adjusted and the exhaust-valve turned so that, whilst all the condensed water may escape, no steam shall

FIG. 107.

Steam kettle.

FIG. 106.

Patch's steam boiler.

FIG. 108.

Enamelled steam kettle.

be allowed to go to waste by its being opened too widely. One of the

greatest objections to the use of tinned-copper kettles is that the coating of tin soon wears off, and contamination of the extract or liquid with copper is almost sure to result. The enamelled cast-iron kettle made by Barrows, Savery & Co., of Philadelphia, shown in Fig. 108, is to be preferred on this account, although the injurious cracking of the enamel from overheating and the resulting exposure of the liquid to the iron surface beneath is an objection. It is proper to state that with care the

FIG. 109.

Steam coil.

enamel may often be retained for years in perfect condition. Jacketed iron tanks lined with sheet block-tin are very useful and durable, but their costliness is apt to prevent their extended use.

Pressure steam is frequently passed through coils of iron, block-tin, or lead which have been immersed in the liquid to be heated. Fig. 109 shows the usual form. It will be found very useful to the practical worker to use block-tin pipe. Steam-valves may be soldered to both ends of the pipe, and on account of the flexibility of the pipe it may be readily adjusted and coiled to suit available space, whilst the absence of danger from contamination when used for heating most medicinal liquids is an advantage which should not be overlooked. Steam, when

FIG. 110.

Upright steam coil.

FIG. 111.

Horizontal steam coil.

FIG. 112.

Zigzag steam coil.

passed through coils of various shapes, zigzag pipes, etc., is also largely used in heating liquids in special operations, in drying drugs, chemicals, etc. Figs. 110, 111, and 112 illustrate these forms. (See also chapter on desiccation.)

QUESTIONS ON CHAPTER III.

USES OF HEAT.

- What is a blow-pipe, and how is it used?
 What is it used for?
 How is Fletcher's gas blow-pipe arranged?
 What is the construction of a foot-bellows?
 What is a crucible, and what is its use?
 Of what materials are crucibles made?
 What sort will bear great heat without danger of breaking?
 What is the best metal from which to make crucibles, and why?
 What processes require the application of high heat?
 What is ignition? Give an example of ignition.
 What is fusion? Give an example of an official preparation in which this process is used.
 What is calcination?
 What is deflagration?
 What is carbonization? Give an illustration.
 What is torrefaction? Give an illustration.
 What is incineration?
 What is sublimation?
 In operations requiring lower temperature, what contrivances are used for controlling the heat?
 What is a sand-bath?
 What is an oil-bath?
 What temperature does an oil-bath furnish?
 What temperature does a glycerin-bath furnish?
 What temperature does a salt-water bath furnish?
 What is a water-bath?
 What is latent heat?
 When water at 0° Centigrade is mixed with an equal weight of water at 100° Centigrade, what is the temperature of the mixture?
 How much water will 100 parts (by weight) of steam raise from the freezing-point to the boiling-point?
 What temperature can be obtained by an open steam-bath?
 What is the pressure of the atmosphere to the square inch?
 If water be heated continuously under pressure, what will be the result?
 Describe an upright tubular steam boiler.
 What is the objection to using tinned-copper steam kettles?
 What is the objection to using enamelled cast-iron steam kettles?

CHAPTER IV.

VAPORIZATION.

UNDER this head will be included those pharmaceutical operations in which volatile substances are separated from fixed bodies, or from others which are less volatile, by the action of heat at varying temperatures. Vaporization is frequently employed in pharmacy, and it will be most convenient to consider its applications in the order of their importance :
1. To Liquids. 2. To Solids.

1. When vaporization is used to separate a *volatile liquid* from a *less volatile liquid*, it is called *evaporation*.

2. When the object sought is the *volatile liquid*, it is called *distillation*.

3. When it is used to separate a *volatile liquid* from a *solid*, it is called *desiccation*, *exsiccation*, or *granulation*.

4. When it is used to separate a *volatile solid* from another body, it is called *sublimation*.

The following diagram may serve to impress the definitions on the memory :

Vaporization.

Object Sought.	Process.
Liquids :	
Fixed or less volatile	Evaporation.
Volatile	Distillation.
Solids :	
Fixed	{ Desiccation. Exsiccation.
Volatile	
	Granulation.
	Sublimation.

The subjects of Evaporation, Distillation, Sublimation, and Desiccation will be considered in the chapters which immediately follow. Vaporization, as applied to Granulation and Exsiccation, will be more appropriately considered after the chapters on Solution and Crystallization.

EVAPORATION.

Although this term has in its more popular sense the signification of the separation of moisture from any body, whether solid or liquid, in pharmacy the word has a more restricted meaning, and signifies the driving off of the more volatile or less valuable portions of a liquid by the application of heat, with the object of purifying it or obtaining the less volatile portion. Illustrations are found in the concentration of syrups and liquids intended for crystallization, and in the treatment of weak tinctures in making fluid-extracts and extracts.

As *ebullition*, or *boiling*, is an important form of evaporation, it will be necessary first to consider the essential points concerned therein. Ebullition in a heated liquid is caused by the formation of bubbles of vapor upon the surface of the vessel, which, rising to the surface of the liquid and bursting, permit the vapor to become diffused in the space above the boiling liquid. The *boiling-point* of a liquid may be defined as the temperature at which the tension of its vapor is equal to the pressure of the atmosphere, this point being *definite*, whilst *evaporation* takes place in the same liquid at nearly all degrees of heat, and hence the *evaporating* point is an *indefinite* temperature. The point at which a liquid boils varies with the liquid, and in the U. S. Pharmacopœia and other authoritative works the boiling-point is frequently considered an important test in establishing the identity or purity of a liquid. The table at the end of this chapter shows the boiling-point of the official liquids arranged in order, beginning with the lowest.

The boiling-point of a liquid is affected by the cohesion of the liquid and the degree of pressure upon its surface. Water under the ordinary pressure of the atmosphere boils at 100° C. (212° F.). When confined in a steam boiler it has been shown that water can have a temperature considerably over 200° C. (392° F.) without boiling, the bubbles being prevented from rising to the top on account of the pressure of the steam in the confined space above the liquid. On the other hand, the removal of pressure causes a liquid to boil below its normal boiling-point, as will be explained in the chapter on vacuum apparatus. The character of the vessel in which a liquid is boiled has also a slight effect in modifying the boiling-point. (See Evaporation by Boiling.)

Determination of Boiling-Points.—One of the simplest methods of ascertaining the boiling-point of a liquid is illustrated in the cut (see Fig. 113). The liquid is introduced into a test-tube, and a glass tube is selected of such diameter as will permit a tube-thermometer to pass easily through it and leave a small space between; the tube should be about one inch shorter than the thermometer. A short piece of wire should be passed through the glass ring of the thermometer, and slightly bent to hold it in position; a perforated cork should now be fitted tightly to the test-tube, and the tube carrying the thermometer-tube pushed through the perforation in the cork until the bulb of the thermometer is just above the liquid; heat should be applied cautiously by a sand-bath or water-bath. The vapor from the boiling liquid passes upward through the whole length of the thermometer, escaping at the top, and thus the error common to some methods, due to the difference in temperature between the portion of the thermometer in the test-tube and that outside of the test-tube, is measurably avoided.

Tension of Vapors.—If a glass tube, thirty-six inches long, closed at one end, is filled with mercury, and the open end, after closing it

Fig. 113.

Boiling-point test.

with the finger, carefully inverted in a beaker containing mercury, it will be found that the mercury will run out from the tube into the beaker until a column of mercury about thirty inches in height is left: this column is sustained by the pressure of the atmosphere, and is, in fact, the well-known mercurial barometer-tube: the six inches of space in the tube above the level of the mercury is of course empty, or vacuum. Now, if a few drops of water are passed into the tube by a dropper, they immediately rise to the level of the mercury in the tube, and, although the temperature has not been increased, a portion of the water is vaporized, and the column of mercury is proportionately depressed: this depression is due to the elasticity or tension of the aqueous vapor. If the tube be forcibly pushed down into the mercury, the increased pressure will be found to have liquefied the vapor, and the original quantity of water is recovered; but the depression in the column of mercury may be increased by heat, and when a sufficient amount of heat has been applied to the tube to expel the mercury until none is left in the tube, it will be found that the temperature marks 100° C. (212° F.), which is exactly the boiling-point of the liquid (water), showing that this point must be reached in order to overcome the pressure of the atmosphere. If alcohol or ether be substituted for water, it will be found that the mercury will be depressed in a far greater ratio,—this being due to the greater volatility and lower boiling-point of these liquids. The *maximum density* of the vapor of a volatile liquid in a confined space in contact with the corresponding liquid is reached when its elastic force attains the limit beyond which pressure produces the liquefaction of the vapor. When this limit is reached, the vapor is said to be *saturated*: maximum density varies with the temperature. If a saturated vapor in an enclosed tube is not in contact with an excess of liquid, increase of temperature lowers its density or expands it. On the other hand, when a saturated vapor is cooled, liquefaction gradually takes place, the vapor above the liquid remaining in the condition of maximum density until converted into the liquid: so that *cold* and *pressure* have the effect of *converting vapors into liquids*, whilst *heat* and the *removal of pressure* have the reverse effect,—i.e., the *conversion of liquids into vapors*. The phenomena above described characterize evaporation into a space filled with air as well as evaporation into a vacuum, the only difference being that more time is required to produce the same effects when evaporating in contact with air, for volatile liquids are instantly converted into vapor in a vacuum, while the presence of air retards, but does not prevent, vaporization. A consideration of the foregoing facts leads to the following deductions:

1. The quantity of vapor that will form in a confined space depends upon the amount of pressure and heat to which the liquid is subjected; and when the point of maximum density of the vapor is reached, evaporation ceases if the pressure and temperature remain the same.

2. The rapidity of evaporation of an aqueous liquid in the open air is influenced by the condition of the aqueous vapor always present in the air. If it has the greatest density possible for the degree of heat, evaporation is retarded; but if the aqueous vapor in the atmosphere

is much below the state of maximum density, as is usually the case, evaporation is promoted.

3. Rapidity of evaporation is increased by removing the pressure of the atmosphere.

4. Increase of temperature obviously accelerates evaporation, by increasing the formation of vapor.

Evaporation of Liquids by Boiling.—In evaporating *by boiling*, temperature, pressure, etc., being equal, the rapidity of the process depends upon the *extent of surface exposed to the heat*.

Fig. 114 represents a profile view of two evaporators, A and B. The corrugated bottom of A gives twice as much surface as the smooth bottom of B, and hence if the same quantity of a liquid is made to boil in each, at the same temperature, the bubbles of vapor given off from the corrugated bottom will be twice as numerous as those formed on the plain bottom.

FIG. 114.
Evaporation by boiling.

The superiority of tubular boilers over the ordinary plain or Cornish boiler also affords a good illustration of this fact (see Fig. 105).

When a pure, volatile liquid is heated to the boiling-point in the open air, its temperature remains the same until the whole of the liquid has evaporated. If, on the other hand, solid matter is dissolved in the liquid, the temperature of the solution is gradually increased until saturation is reached: this fact is well illustrated by considering boiling-points of saturated solutions of various salts (see page 127), and it shows the importance of diminishing the heat in the evaporation of solutions of organic substances as evaporation progresses, as, for example, in the making of extracts, etc.

The cohesion of a liquid affects its boiling-point, dense, thick, and sticky liquids offering more resistance to the escape of the bubbles of vapor than rare, mobile, or thin liquids.

The relative depth of liquid also influences the boiling-point. Shallow vessels favor ebullition, because they afford proportionally less weight of liquid above the bottom of the dish for the bubbles to escape through than deep ones. Rough metallic surfaces favor evaporation by boiling, and are better than smooth surfaces, because they expose a greater amount of surface to the source of heat.

Evaporation below the Boiling-Point.—In evaporating liquids *below their boiling-point*, temperature, pressure, etc., being equal, rapidity of evaporation depends upon the *extent of surface exposed to the air*.

Figs. 115 and 116 show two vessels of exactly the same diameter, but of different capacity, containing water: both expose the same amount of surface to the air, but that of Fig. 116 contains eight times more liquid than that of Fig. 115.

FIG. 115. FIG. 116.
Evaporation below the boiling-point.

If both be subjected to the same temperature, *provided it be below 100° C. (212° F.)*, the water will evaporate as rapidly from one as from the other.

Proper Shape of Vessels for Evaporating Liquids.—Broad,

shallow vessels should be used for evaporating below the boiling-point, because the extent of surface is proportionally greater in vessels of this shape. Fig. 117 is an illustration of a porcelain evaporating dish having

FIG. 117.

Porcelain evaporating dish.

FIG. 118.

Glass evaporating dish.

the proper shape: the chief objection to dishes of this kind is their liability to breakage. Care should be taken to dry the bottom of the dish

FIG. 119.

"Agate-ware" evaporating dish.

thoroughly before placing it over a gas-flame. A glass evaporating dish is shown in Fig. 118. This should always be used in a sand-bath, or should be otherwise protected from direct heat. Enamelled cast-iron dishes are very useful, notwithstanding the lack of durability of the enamel. Enamelled sheet-iron dishes, called "agate-ware," are very light, and are much more lasting than the ordinary enamelled cast-iron dishes (see Fig. 119).

Use of Stirrers.—By stirring an evaporating liquid the surface is largely increased, whilst the currents of air produced at the same time greatly assist in dissipating the vapors which rise. Upon the small

FIG. 123.

Rotary stirrer.

FIG. 121.

Porcelain stirrer (double).

FIG. 122.

Horn stirrer.

FIG. 120.

Porcelain stirrer.

scale, porcelain, horn, or wooden stirrers are used (see Figs. 120, 121, and 122), whilst mechanical stirrers are usually employed in the labo-

ratory in more extensive operations. Fig. 123 shows a rotary stirrer to be operated by steam-power.

Vacuum Apparatus.—It has already been shown (page 130) that the boiling-point of liquids is lowered by removing the pressure of the atmosphere. This fact is easily proved by placing under the receiver of an air-pump some alcohol in a test-glass containing a few pieces of broken glass; when, upon exhausting the receiver, many bubbles of vapor will rise from the surface, and the liquid will boil at the ordinary temperature. Water will boil at 84°C . (183.2°F .) upon the top of Mont Blanc, on account of the diminished pressure of the atmosphere.

The practical application of these principles is of great importance in pharmacy, and vacuum-pans are frequently used in the larger laboratories

FIG. 124.

Vacuum apparatus.

for concentrating solutions which are injured by heat under the ordinary pressure of the atmosphere, and especially in evaporating solutions of organic substances, for these are almost without exception injured by heat.

In Fig. 124 a vacuum-pan, made by Lafferty, Gloucester, N. J., is

shown. The top of the pan or kettle is furnished with a very wide pipe, which is bent twice, and connected at its lower extremity with a steam-pump. Steam-pipes are attached to the bottom of the vacuum-pan so that a moderate heat may be used if necessary. The air is exhausted from the pan upon starting the pump, and the vapor from the evaporating liquid may be condensed or wasted as desired. The pan is furnished with thermometers, gauges, windows, etc., so that the evaporation is under complete control.

It frequently happens that the pharmacist is unable to devote much space to laboratory operations; this is particularly the case in cities or large towns, where rents are high. When pharmaceutical operations must be conducted in the store, an absolutely indispensable convenience is an *evaporating chamber* (see Fig. 125). If the arrangement of the store will admit of it, this should be built into a chimney-breast. The

FIG. 125.

Evaporating chamber.

bottom of the chamber is preferably made of a slate slab, which should have a slight inclination towards the front, and be large enough to project about two inches over the closet upon which it rests, for the purpose of preventing a liquid, spilled by accident, from running into the closet and soiling the contents. The chamber should have a gas-pipe in it, and the upper part should connect, by a flue in which there is a damper, with a chimney having a good draught. A wooden or galvanized-iron front having a light of glass fitting tightly in it will prevent vapors or odors from getting into the store, while operations

can be seen and go on with occasional attention. The space below may be utilized as a closet for evaporating dishes, gas stoves, etc.

Evaporation by Direct Heat.—This method usually requires the greatest amount of care in order to avoid loss or injury by overheating:

FIG. 126.

Flask evaporation.

it is to be preferred, therefore, only in cases where the residue is not easily injured by such an accident. The evaporation of saline solutions in crystallization, or of weak aqueous organic solutions, may usually be performed by the application of direct heat. Careful watching, however, is necessary, and also frequent stirring, to prevent the formation of a crust upon the bottom. Fig. 126 shows a method of evaporating by direct heat by using a flask supported on a piece of brass-wire gauze, upon a retort stand.

Evaporation to a Fixed Volume.—This operation cannot be performed accurately without inconvenience, and hence it is much more satisfactory to evaporate a liquid to a definite weight,—all that is necessary in the latter case being to use a tared dish, and weigh the dish and contents when evaporation has progressed to the desired point. In evaporation to a definite measure, a

graduated evaporating dish (see Fig. 127) may be employed, care being taken to level it by noticing that the height of the liquid is the same on

FIG. 127.

Graduated evaporating dish.

each side, or the expedient illustrated in Fig. 128 may be resorted to. An ordinary evaporating dish, D, is placed upon a grommet, G (see page 144), and subjected to the heat (in this case the temperature is intended to be that of a warm room); a perforated wooden strip, A, is placed across the dish, and a glass thermometer, T, is supported in an upright position in the liquid by

a perforated cork. Sufficient water is poured into the dish to equal the final measure of the liquid, and a small rubber band is slipped on the

thermometer (or a piece of string tied on) to indicate the desired level of the liquid; the water is replaced by the liquid to be evaporated, and evaporation proceeded with until the liquid has been lowered to the mark on the thermometer. When the use of a thermometer is unnecessary, a notched stick may be substituted. In order to arrive at results approaching accuracy by these methods, the liquid must be allowed to cool to the temperature of the water which was used as the measure of the liquid in the beginning.

FIG. 128.

Measuring evaporator.

Use of Hoods.—A hood is a contrivance, usually of a conical shape, intended to collect and dispose of vapors which, from their disagreeable odors or their suffocating effects, render the atmosphere of the store or laboratory unwholesome. Fig. 129 shows a

FIG. 129.

Hood.

form of hood which has been found useful upon the small scale: it is made of galvanized iron, and connects by galvanized stove-pipe with the strong draught of a good chimney; the stove-pipe running horizontally to the chimney should have a damper in it. If any condensation of the vapors takes place in the stove-pipe, the larger diameter of the circular hood will cause the drops of liquid to fall outside of the evaporating dish, and thus contamination of the contents of the dish is avoided. Hoods are usually made of wood when intended for operations upon the large scale. Fig. 130 illustrates the method of using a hood when the dish is placed upon a stove.

FIG. 130.

Stove hood.

Use of Grommets.—One of the inconveniences in using round-bottomed evaporating dishes is due to the shape of the bottom, serious loss often

occurring from the tilting of the dish and spilling of the contents: to obviate this, *grommets* should be used. These may be economically made from a cast-off piece of rubber hose or tubing by bending it into a circle, placing a wooden plug in one end, tacking it securely, and inserting it in the other end and fastening it in the same manner (see Fig. 131): an elastic ring is thus formed, upon which an evaporating dish or round-bottomed vessel may be safely placed. Grommets serve another very important purpose, that of preventing the fracture of a porcelain or

glass dish containing a hot liquid, by being placed between the hot dish and the cold surface of a table or floor.

Spontaneous Evaporation.—By this term is meant the evaporation of a liquid at the ordinary temperature of the atmosphere, or without the application of strong, direct heat. It is used in cases where the residue or less volatile liquid is liable to injury or loss by the application of much heat, or in crystallization, where, by the slow vaporization of the volatile liquid, finely-formed crystals may be secured, and in other less important operations. Spontaneous evaporation is usually conducted in drying-rooms or closets when they are accessible; these, as will be subsequently described, are rooms or closets which are very slightly heated by the use of exhaust steam or other means; or this form of evaporation may be used by placing the liquid in shallow dishes or trays and exposing the

surface to the rays of the sun during fine weather. Upon the small scale, one of the most convenient methods is to support the dish upon a wire tripod placed upon a stove, at a sufficient distance above the top of the stove to avoid injury, or if heated air from a furnace is available, it can be utilized by supporting the dish, properly protected, over the register; the upward current of dry heated air greatly assists in promoting the evaporation.

Table of Boiling-Points of Official Substances.

Æther	37° C.	=	98.6° F.

QUESTIONS ON CHAPTER IV.

VAPORIZATION.

- What is vaporization?
- What is evaporation?
- What is distillation?
- What is desiccation?
- What is exsiccation?
- What is granulation?
- What is sublimation?
- What is meant by ebullition or boiling?
- What is meant by the boiling-point of a liquid?
- Is the boiling-point of a liquid a definite temperature?
- Is the evaporating-point of a liquid a definite temperature?
- What is the boiling-point of water under the ordinary pressure of the atmosphere?
- When confined under pressure, how high can its temperature be raised without boiling?
- What will be the effect upon boiling if the pressure is made much less than that of the atmosphere?
- How may the boiling-point of a liquid be determined accurately?
- What is meant by the tension of vapors?
- What effect have cold and pressure upon vapors?
- What effect have heat and removal of pressure upon vapors?
- Upon what does the quantity of vapor that will form in a confined space depend?
- How is the evaporation of a liquid influenced by the pressure or absence of aqueous vapor in the air?
- How may the rapidity of evaporation be increased?
- Why does increase of temperature hasten evaporation?
- In evaporation by boiling, temperature, pressure, etc., being equal, upon what does the rapidity of the process depend?
- When a pure volatile liquid is evaporated by boiling in the open air, does the temperature change with the amount evaporated?
- If there is solid matter dissolved in the liquid, what takes place on evaporation?
- What inference should be drawn from this,—for example, in the preparation of extracts?
- Which are most easily evaporated,—thin, mobile liquids or dense and thick ones, and why?
- Does the depth of a liquid influence its boiling-point?
- Why are rough metallic surfaces better for evaporation than smooth ones?
- In evaporating liquids below the boiling-point, temperature, pressure, etc., being equal, upon what does the rapidity of the process depend?
- Therefore, what shaped vessels should be used for evaporating liquids below the boiling-point?
- What effect is produced by stirring an evaporating liquid?
- Will water boil at a higher or lower temperature in more elevated positions, and why?
- What application is made of this principle in pharmacy?
- What is an evaporating chamber, and how should it be constructed?
- What is the objection to evaporating liquids by direct heat?
- In evaporating a liquid to a definite measure, how may it be ascertained when the measure has been reached?
- What is a hood, and what is its use?
- What is a grommet, and what are its uses?
- What is meant by spontaneous evaporation?
- How may it be advantageously conducted?

CHAPTER V.

DISTILLATION.

THE first part of the process of *distillation* is identical with that of evaporation, for it is simply the *vaporization* of the volatile liquid through the application of heat. The next step is distinctive and opposite, and consists in the conversion of this vapor into a liquid by the application of cold: this part of the process is called *condensation*.

The elements of distillation are: 1, vaporization, and, 2, condensation. The subject of vaporization was treated of in the preceding chapter: we have now to consider condensation.

Condensation.—It has been already shown (page 128) that when a *liquid* is *vaporized* a certain amount of heat disappears or is rendered latent, and when a *vapor* is *liquefied* a corresponding degree of heat is evolved or reappears. Whilst the practical application of this law is of great service in the use of steam for heating purposes, the opposite process of condensation shows its disadvantages, because of the relatively large quantity of cold water necessary to liquefy vapors.

The greater the difference in temperature between the condensing surface and the vapor, the more rapid is the condensation; and it has been computed that steam at 100° C. (212° F.) requires about twenty-five times its weight of water at 20° C. (68° F.) to condense it. The proper relation between the heating and condensing surfaces of apparatus used in distillation can only be known by careful study of the laws governing vaporization and condensation, or by practical experience.

Apparatus used in Distillation.—In considering the many kinds of apparatus used in distillation, two typical forms are presented: 1, the *alembic form*, in which the vapor is condensed in an enclosed space immediately above the heated liquid, and, 2, the *retort form*, in which the vapor is condensed in a vessel placed at one side of that containing the heated liquid, and connected with it by a suitable tube or pipe.

The Alembic.—This is probably the most ancient kind of distillatory apparatus, and in its original form it is now rarely employed. The *body*, or *cucurbit*, is usually globular or oval in shape, and at its junction with the hemispherical *head* or *dome* there is a gutter or groove. This serves to collect the condensed vapor or distillate, which is carried off by a tube, as shown in the illustration (see Fig. 134).

Fig. 135 shows an alembic which, according to Mr. Brady, of Newcastle, England, is still frequently employed in Japan. Into the boiler, *a*, is fitted a short cylinder, *b*: this has a perforated bottom, and the gutter communicates with the spout; the condenser, *c*, has a cover, *d*,

and is also furnished with a spout for carrying off the water used in cooling the dome after it has been heated by the vapors rising from the boiling liquid in the body. This still, or, as it is called by the Japanese, *lambik*, is shown because it represents the alembic probably in one of its

FIG. 184.

Alembic.

FIG. 185.

Japanese lambik.

best practical forms, and the advantages possessed by this kind of distilling apparatus are seen to be compactness and simplicity. It is, however, not fitted for distilling very volatile liquids, is very inconvenient and troublesome, because of the necessity for constantly replacing the water used in the condenser, and distillation is slow and tedious.

The Retort.—This form of distillatory apparatus has many advantages over the alembic, which it has almost entirely replaced. A retort, in its

FIG. 186.

Plain retort.

simplest form, may be described as a long-necked glass flask in which the neck, after being heated thoroughly, is bent over until its axis makes an acute angle with that of the bowl of the flask. Retorts are of two kinds,—plain and tubulated. A *plain* retort has just been described (see Fig. 136). If it has a *tubulure* or orifice at the top of the bowl for the purpose of introducing the liquid to be distilled, it is said to be *tubu-*

lated (see Fig. 137). Retorts are made of glass, porcelain, earthenware, platinum, iron, lead, etc., according to the purposes for which they are designed.

Porcelain and earthen-ware retorts are used in the distillation of

phosphorus, mercury, etc.; platinum and iron retorts, in destructive distillation; leaden retorts, in making hydrofluoric acid, ether, etc.

The glass retort is the only kind, however, which will be considered here in detail. The shape of a retort is an important point to regard in its selection: retorts having deep bowls are best suited for very volatile liquids. The lower surface of the neck of the retort should form

a decidedly acute angle with the surface of the bowl if tubulated; a line drawn from the centre of the stopper should touch the centre of the bowl, A, so that when a funnel is introduced into the tubulure, T, to charge the retort, the contents may all be delivered into the bowl without soiling or splashing the neck. The neck of the retort should gradually taper to the end, and the beak, B, should never be larger in diameter than any other

FIG. 187.

Tubulated retort.

portion of the neck, otherwise difficulty may be experienced in making joints with adapters, receivers, or condensers (see Fig. 138). Such a fault may prevent the use of a cork ring in joining, for this ring should be made tight by forcing it up the gradually-increasing diameter of the neck. The glass forming the retort should be carefully annealed and have a uniform thickness: extremes should be carefully guarded against. If the glass be too thick, the sudden changes in tem-

FIG. 188.

Badly-formed retort.

perature, to which retorts are constantly subjected in distillation, may cause fracture; on the other hand, if too thin, they are easily broken in cleaning. Scratches and imperfections in the bowl should cause retorts to be rejected.¹ The objections to the use of retorts are mainly due to

¹ Although there is no disposition on the part of the author to weaken the force of this conventional advice, the possession of a retort having a large bubble in the bottom of the bowl, which has been in successful use for ten years and has outlasted many of its more perfect fellows, supplies the needed exception.

their peculiar shape, the principal one being the difficulty of cleaning them thoroughly. The necessity for having a variety of different shapes and sizes to suit special operations is greater than when distillation is performed with flasks and bent tubes.

FIG. 139.

Distilling flask.

Flask distillation will be usually found most practicable for pharmaceutical work. The best shape for a flask is shown in Fig. 139. The bowl should have a flat bottom, so that it will stand unsupported; the neck should be wide, to admit a large cork, so that there will be plenty of room for a wide bent tube, a thermometer, and a safety or charging tube (see Fig. 140). The advantages of using a flask

instead of a retort for all distillations that will allow of it are several: it is easily cleaned, it is useful for other purposes, for instance as a measure,

FIG. 140.

Bent tube, etc., for distilling flask.

as a container, or as a receiver for the distillate, and the parts are readily replaced in case of breakage. One of the most important parts of this apparatus is the bent tube for conducting the vapor to the receiver or condenser: the diameter of the tube should be as large as the receiver or condenser will conveniently accommodate.

Cutting Glass Tubes.—The glass should be moderately thick and of the proper length. A glass tube may be broken neatly by scratching it across with a sharp three-cornered file, and then grasping it with both hands, one on each side of the scratch, and making a slight outward pressure, which will generally produce a clean fracture: by holding the sharp edges for a few moments in the flame the corners

holding the sharp edges for a few

may be rounded so that they will pass through a cork without cutting it and making a ragged edge.

Bending Glass Tubes.—A tube may be bent by heating it properly over a gas-flame. To make a symmetrical curve in a tube of large diameter requires considerable skill and practice. One end of the tube should be closed by a cork, and the part of the tube that is to be bent held just above the flame and gradually rotated between the fingers, so that it may be heated evenly throughout: it should also be passed to the right and left through the flame for the space of an inch or two on each side of the middle of the proposed bend, and very slowly allowed to curve in one direction, so that the bend shall not be too abrupt. The object of closing one end with a cork is to prevent a current of air from passing through, and, in case collapse from overheating occurs, by gently blowing in the tube the softened glass may be swelled to its proper curve. Fig. 141 shows a tube properly bent, while Figs. 142 and 143 illustrate some of the defects produced by unskilled work. In Fig. 142 the tube was not rotated evenly, and at the top of the bend,

B, it was hot enough to collapse. Fig. 143 represents the effects of hurry and unequal heating, the operator having forced the bend, C, before the tube was heated uniformly. A gas-burner having a solid, steady flame is the best kind to use (see Fig. 66), and draughts of air should be avoided.

Cork-Fitting.—Corks for joining apparatus should be of the *best quality*. They are perforated for the passage of the glass tubes by the use of cork-borers (see Fig. 144). These are cylindrical brass tubes of various sizes, sharpened at one end, and surmounted by a milled-brass cap: they are furnished in sets. A small hole is drilled through both sides of the brass cap, so that an iron rod may pass directly through it and form a convenient handle. They are used by holding the cork firmly with the left hand and pushing the borer through with the right hand, using a twisting motion at the same time so as to cut a smooth round hole. The mistake frequently made in using cork-borers is due to "hurry:" the attempt to force the borer through quickly without rotating it sufficiently, always ends in breaking off pieces of the cork. The cork-borer shown in Fig. 145 is much more convenient for larger corks, and should be used where cork-borers are often needed, the tool-handle, I, being large enough to give the operator a firm grasp, so that the cork may be readily bored. The cutting edge of the borers should always be kept sharp and in good condition by the use of the grindstone

or emery-paper. When the cutters do not bore a hole of the exact size needed for the glass tube, which of course should fit tightly, it is best to select a borer which will cut a smaller hole than that desired, and then to enlarge the hole by filing with a rat-tail or half-round file (see Fig. 146). When the tubes have been fitted, the cork should usually be thoroughly soaked in hot water, for the purpose of swelling and softening it: it should never be soaked before cutting or filing. The rasp and file shown in Fig. 147 will be useful in fitting up large flasks. Rubber corks can often be used with great advantage, and they may be readily perforated by dipping the cork-borer in solution of caustic soda or potassa or strong water of ammonia before beginning to use it. If rubber corks are well dried by wiping them thoroughly, they may be filed easily with a new, sharp, flat file. The main

FIG. 144.

Cork-borers.

FIG. 145.

Cork-borer (large size).

FIG. 146.

Rat-tail file.

FIG. 147.

Rasp and file.

advantage of rubber corks is that they are practically impervious to vapors or gases, and hence require no luting. Substitutes for rubber corks may be made by keeping dry corks in melted paraffine or wax until the pores are thoroughly filled, and then cooling.

Lutes.—The most satisfactory lute for ordinary distillations is made by adding flaxseed-meal to *boiling water* and stirring until a thick, sticky mass results. When the perforated and soaked cork containing the tubes is inserted in the neck of the flask, a small quantity of lute

should be pressed into the joints, and then followed by sufficient to make the joint vapor-tight, the quantity varying with the quality of the cork and the character of the vapor that is to be excluded. If future trouble from leaking is to be avoided, it is usually better to throw away a cork which will not make an almost perfect joint without lute, rather than trust to cover up serious deficiencies with lute. A neat finish may be given to the joint by dipping a finger into water, and with it smoothing the surface of the lute. In Fig. 140 the cork is shown perforated and mounted; in Fig. 139 it is luted and in position.

Bladder Joints.—One of the most useful substances to the practical pharmacist who has occasion to join tubes is a strip of moistened bladder. Hogs' bladders are usually preferred, and it is now possible to get them of excellent quality prepared by being thoroughly cleaned and then soaked in an alkaline solution or in benzin to deprive them entirely of fat. In connecting two tubes of different diameters which are not to be subjected to a high heat, a bladder joint is especially useful. For an ordinary joint of inch glass tube, a strip about six inches long and an inch and a half wide should be moistened and wrapped around the proposed joint; the upper end of the bladder is then tied tightly with strong linen twine, leaving the short end of the twine at least six inches long; this end is carried along the top of the bladder and tied tightly around the lower end of the joint; the long end of the twine is then wrapped spirally and regularly around the bladder until the lower end is reached, when it should be there tied tightly (see Fig. 148). Strips of writing-paper soaked for a few moments in water, and then coated with ordinary, smooth flour-paste to which ten per cent. of glycerin has been added, may also be used for joining apparatus.

Rubber joints are preferred to bladder joints when there is no likelihood of vapor or high heat dissolving or softening the rubber, and when the tubes to be joined are nearly of the same diameter: the ease and celerity with which such joints can be made are their strong points. A piece of rubber tubing is cut of slightly less diameter than that of the tubes to be joined; by moistening the rubber on the inside with water, and stretching it over one end of the glass tube, and then inserting the end of the other glass tube, the joint is made. Success largely depends upon having the rubber tube slightly smaller in diam-

eter than the glass tube, so that the elasticity of the rubber alone will be sufficient to make a tight joint, otherwise the rubber tube must be tied on, and then the advantage over a bladder joint is lost (see Fig. 150). In all cases it is preferable to select tubes which differ slightly in diameter, so that one may slip into the other, the narrower of course having the higher position, so

that the vapor or liquid shall not come in direct contact with the rubber.

Receivers are glass vessels, usually globular in shape, intended to receive distillates. They are

FIG. 154.

Mode of using quilled receiver.

of three kinds,—*plain*, *tubulated*, and *quilled* (see Figs. 151 and 152). When a plain receiver is required, an ordinary flask (see Fig. 153) will answer, but if uncondensable vapors are produced, it is necessary to provide for their escape, or an explosion may occur from the accumulated pressure: this may be done in a tubulated receiver by occasionally removing the stopper, or, better, by connecting a bent glass tube with the receiver and allowing the end of the tube to dip into water, or into an acid solution if the vapors be alkaline, or into an alkaline solution if the vapors be acid. A quilled

receiver is useful where the distillation is to be carried to a definite point and a certain amount of distillate is to be received, or, as in the prepara-

tion of hydrocyanic acid, the end of the quill is made to dip below the surface of the cooled diluted alcohol or water, in order to condense all of the gas. In the distillation of very volatile liquids an effective mode of using a quilled receiver is shown in Fig. 154. A hole is cut in the bottom of a rather shallow tin pan and a short tube soldered into it; a perforated cork will permit the quill of the receiver to pass through it, and at the same time a tight joint should be made; ice or snow is heaped up over the receiver, and any uncondensable gases may escape from the bent tube in the tubulure or be absorbed by the liquid into which the tube dips.

Adapters are tapering tubes of glass which are used to connect retorts with receivers. Fig. 155 shows the bulbed and bent form. Good adapters may be made from retorts having broken bulbs by cutting off

FIG. 155. FIG. 156.

Adapters.

FIG. 157.

Use of adapter.

the broken portion, scratching the tube with a file, and extending the crack thus made entirely around it by slowly passing a red-hot poker over the line marked for the fracture. Fig. 157 shows an adapter of this kind in position.

Charging Retorts.—Plain retorts must be charged by using a funnel-tube: this may be a funnel with an elongated tube, or a modification of it, as shown in Figs. 158, 159, and 160, or one may be improvised by selecting a tube of sufficient diameter to permit of the introduction of a small funnel (see Fig. 161). The object of using a funnel-tube is to prevent the soiling of the neck of the retort; as the object of distillation is usually to purify the liquid, the latter must be delivered into the bowl of the retort without touching the neck. Fig. 162 shows the method of charging a plain retort; a small piece of rubber tube, R, is sometimes placed on the end of the funnel-tube to guide the liquid safely. Tubulated retorts are charged by simply placing a funnel in the tubulure and pouring the liquid in.

FIG. 158. FIG. 159. FIG. 160.

Stopped
funnel-tube.

Funnel-tube.

Thistle-top
funnel-tube.

Safe-y-Tubes.—It is sometimes impossible to avoid sudden evolu-

tions of vapor during distillations. When there is a likelihood of such occurring, it is advisable to insert a Welter's safety-tube into the tubulure of the retort. This tube (see Fig. 163) is bent into the form of an S, having a bulb blown in the middle, and a thistle funnel at the top.

Mercury is poured into the tube before inserting it into the tubulure of the retort, and a piece of loose cotton is placed in the thistle funnel; when undue pressure occurs, the mercury is forced into the cotton and the vapor escapes; when the retort has been thus relieved, the mercury descends into the bulb and the distillation proceeds.

Retort-stands are used to support properly retorts, flasks, receivers, etc., during distillation, although they are also employed by pharmacists for a variety of other purposes, as in filtration, percolation, evaporation, etc. Fig. 164 shows a retort-stand which has been used with much satisfaction in the laboratory of the Philadelphia College of Pharmacy. It is more substantial than those that are commonly furnished by the

chemical-apparatus makers. The clamp (see Fig. 165) is made upon the principle of one originally devised by S. Lloyd Wiegand, and is hook-shaped, so that any of the different sizes of rings may be unscrewed from the upright rod without disturbing the rest. In many of the common retort-stands the bottom ring cannot be removed without first slipping off all above it. Fig. 166 shows the ordinary retort-ring. The almost universal fault of the retort-stands in common use is their extreme lightness and want of stability; the rings frequently bend under such weights as should be easily borne, and, owing to the base being too light and small, the whole stand is sometimes upset during an operation. In the stand shown in Fig. 164 the base-plate is permanently fastened to the operating counter in a place known to be the most convenient; if the counter is one that must be used for other purposes, the base-plate may be screwed to the under side of the counter, and a five-eighths-inch

hole bored through the counter, so that the centre shall coincide with the centre of the hole in the base-plate. When the retort-stand is not in use, the hole in the counter may be closed with a cork. The upright is made of half-inch iron tubing, and can be quickly screwed into the base-plate

with the hands without the use of pipe-tongs. The rings and clamps are in one piece, and are made of malleable iron, so that if dropped on the floor they are not likely to break. When used for holding a glass percolator or funnel, the danger of fracture on account of the contraction of the iron ring may be avoided by stretching three split sections of rubber tubing upon it (see Fig. 167).

Bumping is the term applied to a phenomenon occurring when certain liquids are heated to the boiling-point in glass vessels. Ebullition often proceeds regularly at first and the vapor is given off continuously, when suddenly the surface of the liquid will become smooth for a few seconds. This is succeeded by a slight explosion, when the accumulated vapor is violently expelled and the liquid is said to "bump;" these effects occur alternately, and increase as distillation progresses, and some liquids, particularly sulphuric acid, cannot be distilled in glass vessels without using certain precautions. The exact cause of bumping has not yet been satisfactorily explained, but the fact that the forces of cohesion and adhesion in certain liquids are greater when they are boiled in glass vessels than in metallic vessels has been proved. The expedients that have been used to prevent bumping, or rather to lessen its effects, usually consist in the addition of some insoluble solid substance to the liquid, such as broken glass, a fragment of charcoal (when admissible), piece of clay pipe, rock crystal, etc.; these serve to break

the explosive force of the vapor in its upward course, and are thus serviceable. Probably as good an expedient to use as any in pharmaceutical operations, is to add a few pieces of glass of irregular shape to the liquid before it is heated.

LIEBIG'S CONDENSER.

This condenser, although now bearing the name of the great chemist, was used before his time. It consists of a long glass tube, surrounded by another tube of larger diameter; two small openings are made, one near the bottom and the other near the top of the large tube. Connection is made with the tube leading to the bottom with a cold-water supply, and the water circulates in the space between the inside of the large tube and the outside of the smaller tube, and finally has its exit at the opening near the top. Fig. 168 shows a large condenser of this

FIG. 168.

Liebig condenser.

form, well suited for illustrating the process of condensation practically. Both tubes are of glass, the ends being of rubber, and made by cutting

FIG. 169.

Liebig condenser (all glass, rubber joints).

two sections from a clothes-wringer roller; the lowest rubber cork is perforated at its lowest convenient point, for the introduction of a short piece of glass tubing, and the upper rubber cork is similarly perforated for the same reason. A rubber tube connects the lower short glass tube with the cold-water supply, whilst another rubber tube, connected with

the upper short tube, carries off the warmed water. For smaller condensers the form shown in Fig. 169 answers very well; the outer glass tube is contracted at the ends and supplied with short tubes as shown, a rubber tube or bladder joint being used to make the joint between the condenser tube and the outer tube. This form is recommended in

FIG. 170.

Liebig condenser (in use).

The liquid which is being distilled is gradually supplied to the distilling flask by the feed-tube from the contents of the bottle on the shelf; the rate of flow is controlled by a pinchcock compressing the rubber tube. An enlarged view of the best form of pinchcock to use for this purpose is shown in Figs. 171 and 172. It was contrived by Dr. Squibb

FIG. 171.

Squibb's pinchcock (open).

FIG. 172.

Squibb's pinchcock (closed).

to overcome the annoyances experienced in using the ordinary forms. It can be easily and quickly applied to or removed from a rubber tube without breaking a joint, and much more perfect control of the flow can be

secured than by the form seen in Fig. 173, which is known as Mohr's. Hoffman's screw pinchcock (see Fig. 174) is often useful, but it cannot be applied or removed so conveniently as Squibb's. A section of compressed tube is shown at A. Fig. 175 shows a method of refrigeration which may be used when the ordinary condensers and a steady supply of water are not to be had. A wide tube is connected with the

Spring pinchcock (Mohr's).

FIG. 174.

Screw pinchcock (Hoffman's).

distilling flask, and some lint, lamp-wick, or other absorbent material is wrapped spirally around it and tied at the ends; a square piece of cardboard is perforated so that it will fit tightly upon the tube, and it is pushed upon the lower end until it is in close contact with the lint; if water can be supplied from a faucet, a rubber tube is connected with it and conducted to the upper part of the condensing tube, and tied in such a position that a stream of water will trickle from it and be carried down by the lint until it reaches the cardboard, where it falls into the vessel prepared to receive it. If hydrant water is not available, a large bottle containing water may be placed upon a shelf, and a syphon, having a rubber tube and pinchcock, attached, as shown in the cut.

FIG. 175.

The Condensing Worm.—The method of condensing by the use of the worm is very old, and its advantage in securing economy of space and its ease of application are very apparent. Fig. 176 affords a good illustration of this kind of condenser used in the larger laboratories. It will be found

FIG. 176.

Condensing worm.

most convenient to attach the condenser to a wooden base, mounted on wheels, of suitable height: this permits the convenient shifting of the condenser to the different stills. Block-tin pipe is the best that can be used for general pharmaceutical work. Copper or tinned-copper tube should be avoided, because it is impossible to prevent the action of acid vapors or liquids upon the copper; soluble salts of copper would thus be

Tube condenser.

Copper or tinned-copper tube should be avoided, because it is impossible to prevent the action of acid vapors or liquids upon the copper; soluble salts of copper would thus be

formed and the distillate often rendered poisonous. Iron tube is not admissible, on account of the contamination from iron salts; pure tin is not affected so easily, and the salts that possibly would be formed are not so objectionable. Block-tin pipe may be wound spirally around a convenient cylindrical vessel, such as a tin can or similar object, to give it the proper shape, and then fastened to three notched uprights and placed in position, as shown in Fig. 176. Earthen-ware condensing worms of all sizes, of excellent quality, are made by Doulton & Watts, Lambeth, London, England, and by John Cliff & Sons, Leeds, England. For condensing acid vapors, as in making spirit of nitrous ether, these condensers are undoubtedly superior to metallic ones.

PHARMACEUTICAL STILLS.

Stills are preferred in all distillatory operations where the liquids or vapors do not act chemically upon the metals of which they are made. Tinned copper is the best material to use in the construction of stills, for, although tinned iron is cheaper, the greater durability of the former renders them in the end more economical. The same typical forms may be seen in the construction of pharmaceutical stills as in glass distillatory apparatus,—i.e., the alembic and retort.

Pharmaceutical Stills—Alembic Principle.—One of the most useful stills constructed on this principle was devised by Prof. Procter in 1847. The still body was connected with the condensing head or dome by a water-joint, and the sides of the dome were continued up into the head so that an alembic-gutter was formed to catch the condensed liquid; this was delivered at the spout, and this spout was partly surrounded by the jacket. Water for refrigeration was supplied by a tube; this first circulated around the delivery-spout, and then found an exit through a rubber tube. Wiegand's still is shown in Fig. 177. It differs from Procter's principally in the method of joining the head of the still to the body;

FIG. 177.

Wiegand's still.

Wiegand's still is shown in Fig. 177. It differs from Procter's principally in the method of joining the head of the still to the body;

the sides of the head are tapering, so that the head can be pressed down tightly into the body, and with the aid of flaxseed lute a tight joint can be made; the feed-pipe is useful in charging the still, from the fact that it carries the liquid below the point where it would be likely to soil the condensing surface by splashing. Prof. Curtman's still (see Fig. 178) has several modifications about it which require special notice. The

FIG. 178.

Curtman's still.

used for refrigeration circulates around the central tube, N, in the Liebig's condenser, and then finds an outlet into the head B by means of the bent tube L.

FIG. 179.

Curtman's still (sectional view).

jacketing of the neck of the alembic, which is partially carried out in Procter's and Wiegand's stills, is extended so that it is converted into a Liebig's condenser; a bent tube, L (see Fig. 179), serves to convey water partially heated from contact with the vapor over into the head, B: this modification is especially intended to strengthen alcohol which is in process of recovery from weak tinctures; the water of the bent tube L. The intention is to regulate the flow of water so that it shall be sufficient to condense alcoholic vapor passing through the tube, the heated water from L being at the same time of a temperature just above that of the boiling-point of alcohol (180° F.): the vapor of water coming over with the alcoholic vapor comes in contact with this heated surface, and, as the boil-

ing-point of water is 100° C. (212° F.), the temperature of the condensing surface (180° F.) is sufficient to condense the vapor of the water, but not that of the alcohol; thus the water is separated and trickles back into the still, while the alcoholic vapor passes on into the condenser.

A still on the alembic principle, made by Whitall, Tatum & Co., is shown in Figs. 179a and 179b. E represents the boiler, the pan C being used as a water-bath if required. The vapor rises through the tube H and passes into the chamber B, where it is condensed. The reservoir A is supplied with cold water, ice, or snow. The condensed liquid flows into a trough around the tube H and is discharged through F. At G there is a tubulure, closed with a screw-cap, through which the boiler can be supplied with water or the liquid which is to be distilled. The reservoir A is furnished with an overflow-pipe to conduct away the warm water as distillation proceeds. The still is simple in construction, but in practice it will be found advisable to attach a rubber tube to F to conduct the distillate away from the flame or other source of heat.

FIG. 179a.

Fig. 179c represents Game's still, made by J. M. Maris & Co., of Philadelphia. This still is also constructed on the alembic principle, the special features being the tubes A and B, as shown in the drawing, which are used to supply the still with liquid continuously during the distillation, the tube B connecting with the reservoir and furnishing air to replace the liquid as it flows into the still; the distilling chamber is shown at G, the pipe A descending nearly to the bottom of the still; the pipe B terminates in an inverted funnel near the bottom for the purpose of lessening the possibility of the air-pipe's becoming closed by the splashing of a thick liquid. The mouth of this cone is about three-fourths of an inch above the bottom, and it will be seen that when sufficient liquid has been run into the still from tube A to reach the bottom of tube B, no more liquid falls from the reservoir, and thus the amount of liquid in the still is always limited. When the distillation reduces the quantity of liquid so that it falls below the level of tube B, the liquid runs again from the reservoir, and thus the supply becomes automatic. The other parts of the still will be readily comprehended by inspecting Fig. 179c.

FIG. 179b.

The still shown in Fig. 179d was invented by Professor A. B.

Stevens, of Ann Arbor, Michigan. As will be seen from the illustration, it is made on the alembic principle, but it has several features

FIG. 179c.

about it which differ from the stills heretofore described. A light copper float, having a central rod or stem, is arranged in the still body, so that it will warn the operator when the liquid in the still has evaporated below the danger-point, previously adjusted. One of the best features about this still is the method of joining the two principal parts. The water-joint, which is never satisfactory in actual practice, is replaced here by a rubber rod ring, which fits into a circular groove and is held in place by

clamps which are easily disconnected when the distillation is over. The methods of condensing and refrigerating are similar to those used in the preceding descriptions of alembic stills.

Stills constructed on the alembic principle have the disadvantage of having the cold water supply directly over the source of heat, and, as the latter is usually a coal stove or gas burner, the cold water used for refrigeration is rapidly heated, and much more is required to effect condensation than is the case with stills constructed on the retort principle. Again, the delivery-tube of the condensed liquid is immediately over the fire, and in recovering alcohol from weak percolates (one of the principal uses that pharmaceutical stills are put to) the danger from alcoholic vapor taking fire is great, if constant vigilance is not exercised. Many accidents have occurred through the neglect of the operator to keep a constant supply of cold water applied to the condenser. In cities and towns where water is supplied by a tap or faucet the flow is sometimes stopped by the shutting off of the water when workmen are making repairs to the pipes, and serious accidents are thus likely to occur through the water in the condenser becoming so hot that it will not condense alcoholic or ethereal vapors, which soon come in contact with the flame, and fire or explosion results. In all stills made on the alembic principle care should be observed to connect a metal or glass tube with the delivery-tube of the still, so as to lengthen it and convey the condensed liquid as far as possible away from the flame. Fortu-

FIG. 179d.

nately, water joints are now rarely employed: these usually consist of a gutter running around the top of the still body and filled with water; the head of the still is simply laid on top and held in place by a clasp;

in a short time the heat evaporates the water, permitting the escape of vapor; hence watchfulness is required to renew the supply of water.

The distilling apparatus known as the Prentiss still, or alcohol reclaimer, possesses some peculiarities, a portion of the vapors being condensed immediately over the still: the still body has an upright column screwed to it; this connects by a union joint with the condenser, which is a single pipe bent into a zigzag form and terminating in a spout. The water intended for refrigeration is poured into the funnel at

the top. The distinctive feature, however, is the series of perforated diaphragms which are soldered to a central rod and are placed inside of the column; these are asserted to impede the passage of and condense aqueous vapor when mixed with that which is alcoholic; the alcoholic vapor passes over and is converted into alcohol in the condenser, whilst the condensed water falls back into the still.

A condenser contrived by Charles Rice, in which the block-tin worm is enclosed and placed immediately above the still head, is shown in Fig. 180. The still is heated by steam, which enters at *M*, *N* being the exhaust-pipe. The still head is constructed of copper. The condenser is a cylindrical copper vessel, with rounded

FIG. 180.

Rice's still and condenser.

bottom and closed top, having short half-inch tubes projecting from the bottom and from the top at *B* and *C*. There are two such tubes at the bottom, one for attaching the rubber hose, *A*, bringing the water; the second, shown in the cut immediately alongside the letter *B*, is closed with

a cork, and is used to permit the water to be emptied without detaching the hose from the other. At the top there are two tubes, one at *C* for attaching rubber hose to carry off the water into the waste-pipe *D*; the other, which is closed with a cork, is not shown in the cut, as it is on the back of the condenser.

The head of the still carries three short tubulures, only one of which is visible in the cut: this one contains a cork bearing the safety-valve, *L*. A second one is at the other side, for refilling the still when required, with another narrower tube intended for the insertion of a thermometer. The condensing pipe begins at *E*, where it rises from the head parallel with the condenser. It is made of copper as far as the point indicated by the upper *E*, where it is soldered to the downward projecting upper end of the block-tin worm contained in the condenser and emerging from it at *F*. This arrangement makes it impossible for any condensed liquid to come in contact with anything but block-tin. The worm inside the condenser is made by carefully winding block-tin pipe upon a round block of wood, taking particular care to give the coil a uniform downward descent throughout. After emerging from the condenser at *F*, it extends for a short distance, where the cut shows it to be connected to the separate block-tin pipe, *J*, by means of a union joint lined with tin. Half-way between *F* and the end proper of the worm the pipe is tapped, and a branch, carrying the faucet *H*, leads into the still at *G*, where it terminates under the centre of the head in the form of an , forming a trap to prevent the escape of vapors by this passage. The object of this arrangement is to cause the condensed liquid to flow back into the still as long as the faucet *H* is open, or to collect it outside by turning off the faucet. Prolonged digestions with alcohol may be made by means of this apparatus without any loss of liquid. The head is attached to the still by means of a rubber washer and iron clamps, and when it is desired to remove it the water is allowed to drain from the condenser, the clamps are taken off, and the whole is hoisted up by the tackle *K*, and set on one side.

Pharmaceutical Stills—Retort Principle.—The method of condensing vapors by cooling them in a separate vessel connected with the still by a tube or tubes has been largely employed. The simplest plan is to connect the still head with a Liebig's condenser or a worm. The principal disadvantage of the former method is that considerable space is required in providing for the long tube and its refrigeration, and this is an important consideration in most laboratories. The disadvantage about the worm is one which is still greater, for, whilst space is economized, the spiral shape of the worm prevents the possibility of thoroughly cleaning it, and where a still is used for several purposes the odor and taste of the last liquid used in the still will be very apt to pervade and contaminate the distillate in process of collection. Kolle, in his endeavor to overcome these objections, retained the condensing tub, but, instead of using a worm, bent the pipe into a zigzag form and adjusted it in a vertical plane, the angles of the zigzag tube upon one side projecting through the sides of the tub: these projecting angles were made of separate, short pieces of tube, which were cemented to the condensing pipe. The objection to this condenser was the incon-

venience of breaking and making so many joints. Mitscherlich improved Gadda's condenser by constructing a condenser from two cylindrical vessels, the inner one removable and yet capable of being connected with the outer vessel by a tight joint: deficiency of condensing surface and the inconvenience of making vapor-tight joints were objectionable in this condenser.

From a consideration of the necessity for some new plan for condensing liquids in pharmaceutical stills, whereby the above objections could be overcome, the author was led, in 1872, to employ the principle of the tubular boiler for condensation (see Fig. 181). The body of the still is made of tinned copper; the bottom is not rounded, but flat, permitting it to stand securely on an ordinary counter; the bottom is made of heavier copper than the sides, and is fastened by tucking and folding, thus making a tight joint. A glass tube water-level on the side of the still shows when the liquid has been distilled to a dangerously low point, as well as too active ebullition, which may result in frothing. The glass tube may be removed from the rubber-tube connection by simply slipping it out, and if a thick residue in the still

Pharmaceutical still.

remains, it may be transferred to a bottle or dish by allowing it to escape at the lower tube orifice, thus avoiding loss of product by waste. The still body is connected with the top by a "twine joint," a flat brass ring being soldered to the top of the still body, and another of exactly the same size being soldered to the still top or dome. When the connection is to be made, a piece of soft, thick twine, two inches longer than the circumference of the ring, is soaked in water, and carefully laid upon the brass ring in such a way that the ends overlap; the top is then carefully laid upon the wet twine and securely fastened with clamps, which should be applied at opposite points at the same time, so as to bear equally.

The *still top* differs from most others in having the opening for the escape of vapors drawn over to one side, instead of in the centre; by this arrangement the condensing surface of the dome is reduced to a minimum, and condensation *inside the still* is obviated as far as possible.

The construction of the condenser shows the application of a well-known principle which has been made to do service for an opposite purpose. The substitution of a number of tubes of small diameter for one large vessel is recognized as an effective means of rapidly producing vaporization (see page 131). The principle is of equal value in condensation. The condenser has seven parallel, solid block-tin tubes,

surrounded by a copper case: this case is perforated twice, and a short tube is soldered in at each extremity. To the lower tube a rubber tube is attached, which is connected with a cold-water faucet; a rubber tube is slipped over the upper short copper tube of the condenser for carrying off the water after it has served its purpose of condensing the vapors, which it does by circulating freely between the outer surface of the block-tin tubes and the inner surface of the containing case. The proportions of this condenser are so adjusted that if any liquid likely to be used is actively boiled in the still body, and cold water is running through the condenser, there can be no escape of condensable vapor at the exit-tube. In the condenser for the still holding three gallons the combined length of the tubes is about six feet, and about one hundred square inches of condensing surface are obtained: the condenser itself is fifteen inches long and about four inches wide. Straight, smooth, solid block-tin parallel tubes are used because of the convenience of cleaning them. A piece of cloth wrapped on the end of a rattan or stiff wire may be rapidly pushed through each tube, which serves to clean it when a very odorous liquid has been distilled, but usually it suffices to hold the condenser under a hot-water faucet for a few moments. The methods of connecting the various parts of the apparatus are simple. Two ground-brass joints are made, one at the point of junction of the condenser, with the still head top, and the other where the nose-piece is attached to the end of the condenser: these, on account of their comparatively small diameter, require no clamps or lute, and are vapor-tight. Where a moderate heat below the boiling-point of water is required, the still body is placed in a kettle; and, if the quantity of liquid to be distilled is not large, a round-bottomed, tinned-copper water-bath is clamped between the still body and still head, and the still body filled with water, the waste steam escaping through three apertures in the rim of the water-bath. This water-bath arrangement may be used in addition in making ointments. The automatic feeding attachment consists of a glass syphon, a rubber and a glass tube (the latter passing through a cork), and a pinchcock. The manner of using this is as follows. The still having been charged (about half full), the remainder of the liquid is placed in a vessel above the still body upon any suitable support; the syphon is placed in the liquid, then connected with the rubber tube carrying the pinchcock, and by suction or other means the syphon is filled and the pinchcock screwed down; the other end of the rubber tube is then connected with the glass tube running through the cork, which passes through the tubulure in the still head. Heat is now applied to the still body, the cold-water faucet is turned on to supply the condenser with cold water through the lower rubber tube, and when the distillate comes over in a steady stream a narrow strip of paper is pasted on the glass gauge-tube on the body of the still to mark the level of the liquid at starting. The pinchcock is then opened, and the level of the liquid in the still is regulated so that the liquid neither rises nor falls: this indicates that a stream of liquid from the reservoir above is running into the still exactly equal in volume to that of the distillate running from the exit-tube, and the apparatus may be left to take care of itself. The empyreumatic odor which dis-

tiled and aromatic waters often possess, and which is usually caused by the solid substances lying in immediate contact with the hot still bottom, is obviated in this still by putting the substance into a hemispherical, coarse wire-sieve cage (see Fig. 182): the round bottom of the cage prevents any possibility of contact with the flat bottom of the still, whilst circulation of the water and vapor takes place through the meshes; a handle serves to lift it out when the distillation is completed. Fig. 183 shows a dissected view of the still, which illustrates the relative

position of the parts,—D, the still body; N, tube level; L, clamp; C, water-bath; W, condenser; B, cold-water tube; A, exit-tube for warmed water.

A very useful automatic water still, devised by Herrick, is illustrated by Fig. 184. The lower vessel is the boiler, the middle one the condenser tank, the upper one the supply tank provided with a loose cover. Of the four pipes shown, A is the steam and condensed water tube, coiled, as shown in the condenser tank full of water, and delivering distilled water at A'; B is a pipe leading from the water level in the boiler to the top of the supply tank; C, a pipe, with cock, leading from the bottom of supply tank to the condenser tank; and D, a pipe leading from the top of the condenser tank to bottom of boiler. E is an opening, with air-tight stopper, for filling supply tank; and F, a cock to draw off hot water from boiler. The distillation of water proceeds, after it is once started, automatically. The advantages possessed by such a still are that a constant supply of distilled water can be furnished at a minimum cost. It can be operated by a gas flame, coal-oil stove, or by placing it upon the top of a range or stove, or in fact by any source of heat, and a very little care suffices to keep it running. It is, of course, only suited for distilling one liquid like water, where a constant supply of liquid can be maintained, and is not intended to be used for general pharmaceutical work, such as recovering alcohol from weak percolates, etc.

Fractional Distillation.—By this term is meant the process of separating by distillation liquids having different boiling-points or vapor-densities. When a mixed liquid, or one consisting of liquids of unequal volatility, is distilled, the first portion of the distillate contains a larger proportion of the most volatile constituent than of the others; hence the boiling-point is observed to rise as the distillation proceeds; and if a means is provided for collecting the distillate in several portions, or fractions, as they are called, fractional distillation offers a process by which liquids may be purified or separated. It is impossible, however, *in a single operation* to effect this separation of the component parts of a mixed liquid perfectly, because the distillate obtained at any period of the process is nearly identical with the vapor that is rising from the hot liquid, and therefore it is made up of the condensed vapor of that part of the liquid having a boiling-point at or below the temperature registered by the thermometer, plus the smaller amount of condensed vapor that is given off from the constituents having higher boiling-points, but which emit sensible vapors much below the point at which they actively boil. The relative proportions of the constituents of the mixed liquids have also a bearing in determining the composition of the distillate. By collecting the fractions carefully at stated temperatures, and redistilling each by itself, a more thorough separation may be effected, and this method is usually followed when such a separation is necessary. Upon the small scale one of the simplest forms of apparatus for fractional distillation is made by taking a gas bulb (a glass flask having a bent lateral tube in the neck), and, having adjusted a perforated cork in the neck for a thermometer, passing the tube of the gas bulb into a loosely-stopped test-tube, which is placed in a vessel surrounded with ice or properly refrigerated. A more efficient method is to connect the lateral ascending tube of a flask with the end of a worm, or a condenser so arranged that the liquid condensed at a certain temperature may run back into the flask; vapors having lower boiling-points pass through it uncondensed until they reach the second condenser, which is refrigerated to a degree sufficient to condense all the vapor. This method is used for manufacturing purposes upon the large scale.

Destructive distillation is the process of heating dry organic matter in a distillatory apparatus until all volatile substances are driven over: the residue is said to be carbonized. Destructive distillation is a process which is rarely employed by the pharmacist; hence it is not necessary in this work to treat the subject in detail. Glass vessels are not adapted to the process, because they will not usually stand the heat required without fracture, and the solid residue frequently fuses, is insoluble in water, and becomes so firmly attached to the bottom and sides that it cannot be removed without great difficulty. The best form of apparatus is an open vessel of cast iron, like a crucible, having a flange at the top, a dome with a corresponding flange, and a bent tube for carrying off the gaseous products: the connection is made with fire-clay lute and iron clamps. The manufacture of acetic acid, succinic acid, oil of amber, etc., affords illustrations of the use of this process, which is nearly always performed on a large scale.

CHAPTER VI.

SUBLIMATION.

SUBLIMATION is the process of distilling *volatile solids*. The product is termed a *sublimate*.

The objects of sublimation are—1, to purify volatile solids from admixed and fixed impurities, and, 2, to provide a convenient means of collecting volatile solids resulting from chemical reaction at high temperatures. The retorts or apparatus used may either be of iron, or of glass or stone-ware if the degree of heat necessary will admit of the use of the latter.

Sublimation is almost exclusively confined to operations which are conducted by manufacturers on the large scale. A process was formerly official for the sublimation of benzoic acid. It consisted in introducing benzoin into a shallow tinned-iron pan, and pasting over the top a sheet of filtering-paper. A pasteboard hood, shaped like a hat-box, was then fitted to the pan and tied or pasted with paper so that a tight joint was made; the apparatus was placed on an iron plate and subjected to a low but *uniform* heat: the vapors of benzoic acid passed through the pores of the filtering-paper, were separated from impurities, and, coming in contact with a cooler atmosphere in the hood, slowly condensed, often forming crystals of great beauty.

The temperature at which the condensation of the vapor is effected in sublimation has a very important influence in determining the physical character of the sublimate, and two kinds of sublimates are produced: 1. Cake sublimates. 2. Powder sublimates.

Cake Sublimates.—If the temperature of the condensing surface and of the air in contact is but slightly below that at which the volatile body is capable of subliming, the particles will be deposited in compact masses, like corrosive sublimate, commercial sal ammoniac, or carbonate of ammonia. Fig. 185 shows a simple apparatus for obtaining

sublimates in cakes or masses. A shallow sheet-iron dish, having its upper edge turned out so that it forms a flat ring, is provided with an earthen-ware cover (it will be usually found more convenient to have

the iron dish made to fit the cover than the reverse), through which a hole is drilled to permit the escape of air (this may be done with a three-cornered file). After the substance which is to be sublimed has been placed in the iron dish, a piece of asbestos twine, slightly longer than the circumference of the ring, is laid upon it, and this is covered with a lute composed of equal parts of potters' clay and flaxseed-meal with sufficient water, the earthen-ware cover is pressed upon it until it adheres, and, when necessary, iron clamps are used to make a tight joint. The aperture in the cover is loosely covered with a cone of cardboard, the dish is placed in a sand-bath and gradually heated; the aperture is kept open during the sublimation by occasionally probing it with a glass rod; after cooling, the sublimate will be found adhering to the earthen-ware top in one cake or mass, and may be removed by a spatula. The earthen-ware top may be replaced by a sheet-iron one in cases in which the former would be likely to be fractured by excessive heat.

Powder Sublimates.—If the apparatus for conducting sublimation is so contrived that there is a marked difference between the temperature of the air in contact with the vapor and the subliming-point of the volatile body, the sublimate will be deposited very rapidly and in small particles, like calomel, sulphur, etc.

Fig. 186 shows a convenient apparatus for subliming camphor in powder. It is well adapted also for a lecture-room illustration of the

FIG. 186.

Subliming camphor.

process. A wooden case has two openings made in the sides to admit sheets of glass, which are secured in place by putty in the usual manner. One of the sides has a hinged door, which fits the frame snugly; the opposite side has a tapering circular aperture, which admits the shortened beak of a retort, as shown in the cut. Camphor is placed in the retort, a safety-tube is adjusted in the tubulure, and the retort is then placed deeply in a sand-bath on a good gas stove. Care must be observed in heating at first, and

a Bunsen burner should be at hand to heat occasionally those portions of the top of the retort and the beak upon which the sublimate is forming. When the boiling-point is reached, the camphor vapor passes over rapidly, and at once falls in the form of powder upon coming in contact with the cold air in the chamber. The especial points to be observed are care in heating, and watchfulness that the beak of the retort does not become clogged with the sublimate. A judicious use of the Bunsen flame will soon melt the obstruction.

The most important, and in practice the most difficult, part of the operation of sublimation is the regulation of the heat. The temperature of the condensing surface should always be below the fusing-point of the substance if distinct crystals or crusts are expected.

QUESTIONS ON CHAPTERS V. AND VI.

DISTILLATION AND SUBLIMATION.

DISTILLATION.

- What are the elements of distillation?
 How many times its weight of water at 20° C. (68° F.) are required to condense steam at 100° C. (212° F.)?
 What two forms of apparatus are used in distillation?
 What is the form of an alembic?
 What is the body of it called?
 What is the form of a retort?
 Has a retort any advantages over an alembic, and if so, what are they?
 What is a plain retort?
 What is a tubulated retort?
 Of what materials are retorts made?
 For what purposes are the various kinds used?
 What are the essential qualities of a good retort?
 What are the advantages of using a flask for distillation?
 What is the best shape for a flask?
 How may glass tubes be cut?
 How may glass tubes be bent?
 What is a cork-borer, and how is it used?
 How may rubber corks be cut?
 What is the advantage of rubber corks?
 What substitute for rubber corks may be made?
 How may a satisfactory lute for closing joints be made?
 How may bladder be used to join tubes?
 How may paper be used to join tubes?
 Is rubber superior to bladder for such purposes? If so, why?
 How is it used?
 What are receivers?
 What are tubulated and quilled receivers?
 What are adapters, and how are they used?
 How may plain retorts be charged?
 What is a Welter's safety-tube?
 For what purposes are retort-stands used?
 How may funnels or percolators be protected from the breakage due to contact with the iron rings of the ordinary retort-stand?
 What is meant by bumping in distillation?
 How may it be prevented or lessened?
 What is a Liebig's condenser?
 Describe the pinchcock contrived by Dr. Squibb.
 Describe Mohr's spring pinchcock.
 Describe Hoffman's screw pinchcock.
 How may vapors be condensed when the ordinary condensers and a steady supply of water are not at hand?
 What is a condensing worm?
 What is the best metal to use for making it?
 What objection is there to copper?
 What objection is there to iron?
 What objection is there to tinned iron?
 What objection is there to earthen-ware?
 What is the best material to use for pharmaceutical stills?
 Describe Procter's still.
 Describe Wiegand's still.
 Describe Curtman's still.
 Describe Prentiss's still.
 Describe Rice's still and condenser.
 What is the disadvantage of Liebig's condenser?
 What is the disadvantage of a worm condenser?
 Describe Remington's still and condenser.

What is meant by fractional distillation ?

What is meant by destructive distillation ?

What objection is there to using glass vessels in destructive distillation ?

Give example of products made by destructive distillation.

SUBLIMATION.

What is sublimation ?

What is the product called ?

What are the objects of sublimation ?

Of what material are the retorts or apparatus usually made ?

What effect does the temperature of the condensation point of the vapors of solids have upon the character of the sublimate ?

What is the difference between a cake sublimate and a powder sublimate ?

How are cake sublimates obtained ?

How are powder sublimates obtained ?

What is the most important point to be observed in the operation of sublimation ?

CHAPTER VII.

DESICCATION.

DESICCATION is the process of depriving solid substances of moisture, and in pharmacy should be effected at as low temperatures as possible. (See Exsiccation.)

The objects of desiccating medicinal substances are threefold: 1. To aid in their preservation. 2. To reduce their bulk. 3. To facilitate their comminution.

1. To Aid in their Preservation.—Chemical salts frequently contain water either chemically or mechanically combined with them. An elevation in the temperature, or the absorption of water from moisture present in the air, will in some instances cause *deliquescence*, whilst in others contact with a dry atmosphere will cause *efflorescence*, due to the evaporation of chemically-combined water; hence such salts in their natural condition are unstable; they are much more permanent when dried. Vegetable drugs soon decompose or become mouldy if allowed to remain in a moist condition, and desiccation is absolutely necessary to preserve them.

2. To Reduce their Bulk.—If desiccation is performed successfully, —i.e., at properly-regulated temperatures under certain precautions,—the substance is merely deprived of water without suffering any loss of medicinal activity, and the reduction in bulk that follows is a practical advantage which results in adding to the strength of the medicinal substance.

3. To Facilitate their Comminution.—The presence of water gives to drugs an elasticity and ability to resist disintegration, which in some cases interfere greatly with the process of bruising, grinding, or reducing the drug to particles. One of the first steps in comminution is to dry the substance thoroughly in order to make it brittle or crisp.

The apparatus employed in desiccation is frequently of the simplest character, and the heat is usually not especially created for the purpose, for it is most economical to use the waste heat from kitchen fires or cellar furnaces or the diffused heat in lofts or unused attics. There can be no objection to this if care is taken to provide protection for the substance from dust, light, and injury during desiccation. Herbs may be dried by tying them in bunches and suspending them to the attic ceiling or to the rafters of a barn during summer weather, and this is an excellent method usually, notwithstanding its slowness, because there is no danger of the heat being strong enough to cause loss of valuable volatile principles. Roots, barks, and leaves may be dried by spreading them out upon clean tables or floors in a dry room and turning them repeatedly, so as to

expose fresh surfaces to the dry air. On the large scale, and in the laboratory, special apparatus must be employed. Fig. 187 illustrates a portion of the interior of a laboratory drying-room. Live steam is passed through the pipes when higher temperatures are needed, but waste or exhaust steam from steam kettles is economically and properly used. Trays of suitable size, containing the substance to be dried, are placed on thin muslin, are set upon the shelves of the rack. Ventilators should be provided to carry off the moist air. The space immediately over the steam boiler can often be economically used for a drying-room by placing a sheet-iron floor over it to secure the radiated heat, and arranging racks and trays upon it in convenient positions, or by placing the drugs in barrels in which the heads have been replaced by wire netting, or by simply enclosing the drugs in coarse bags which permit the escape of moisture.

Fig. 188 shows a pharmaceutical drying closet which is simple, economical, and easily made: the heat from the flue of the pharmaceu-

FIG. 187.

Desiccating frame and trays.

tical stove (see Fig. 59) is utilized. The frame which supports the closet is made of half-inch steam-pipe, and to the uprights the retort-rings (see Fig. 164) may be clamped, and the filtration of chilled oils in winter-time, or warm filtration or percolation of

FIG. 188.

Pharmaceutical drying closet.

any kind, may be carried on. The sides of the closet are of thick paper, felt, or asbestos cloth, tacked to a wooden frame, and cleats at convenient intervals are arranged for the trays to slide upon. The stove-pipe from the stove is connected with the flue at the bottom of the drying

closet, and the heat from the smoke and gas passing up the flue is thus utilized; the hood may be dropped over the top of the stove when the latter is not needed for other purposes, the heated air carrying the moisture from the substance to be dried, rising and escaping at the ventilators. Lozenges, crystallized salts, extracts, filters, etc., may all be dried in this cheap and simple closet. One practical point about desiccation is frequently overlooked. It is that substances which are being dried must be repeatedly turned over, so that the parts underneath shall be exposed to the external dry atmosphere. In the case of salts, crystals, and other bodies, if this is not done, a hard crust is formed upon the surface which is often difficult to break up.

A convenient drying closet, suitable for a small laboratory, is shown in Fig. 189. It was contrived by T. Edward Greenish, of London; it is heated by gas, and is intended to fit into a recess in the wall. The drying closet, B, is made of thin sheet-iron, and provided with wire shelves, C, and a tightly-fitting door, D. The closet is made of such a size that when fixed into the recess in the wall a space of about two inches is left at the back, sides, bottom, and top, the space being covered in front by the flanges *a, a*; these constitute, with the door, the front of the closet. E is a gas-burner supplied from the pipe, and F, F are two air-pipes which enter at the bottom of the closet: these pipes draw their supply of air from an *external* source, and thus the laboratory fumes and odors cannot taint the substances which are to be desiccated. The upper ends of these tubes are covered with a layer of sand two inches deep, forming a sand-bath.

The gas being lighted is supplied with air from the front, and the heated air, together with the products of combustion, passes around the closet through openings made for that purpose in the sides and back of the gas-chamber, up the space between the closet and the wall to a pipe, G, and thence to a chimney. The substances to be dried, or the liquids to be evaporated, are placed either upon the shelves or upon the sand-bath. The air which enters by the pipes F, F, slightly warmed by the sand, will carry up any vapor therefrom to a pipe at the top of the closet, and thence to the pipe G. In order to regulate the draught of air at the back and sides of the closet, and thereby to adjust the degree of heat, the pipe G

FIG. 189.

Drying closet (gas heat).

FIG. 190.

Drying oven.

is provided with a circular damper, and the gas-chamber also has in front of it an arrangement for regulating the supply of air to the gas, thus preventing sudden fluctuations of temperature. By these means the heat of the closet may be readily adjusted. If the temperature of the upper shelf is 82° F., the next lower will be 85° F., the next 88° F., the lower one 92° F., whilst the sand-bath will register about 130° F.

A drying oven, intended for drying precipitates in analytical work, but very useful for desiccating small quantities of pharmaceutical substances, pills, lozenges, or drugs like squill, saffron, castile soap, etc., is shown in Fig. 190. Water is poured into the tubulure at the top, and a Bunsen burner furnishes the requisite heat when placed so that the flame touches the under surface, the legs of the oven being long enough to permit its use.

Loss in Drying Medicinal Substances.—When drugs are powdered, loss is always experienced. This arises partly from the escape of fine particles, but principally from loss of moisture in drying. Again, in powdering almost all drugs, a portion remains which resists disintegration. This is called by the miller “gruffs,” and is usually worthless and should be thrown away: the gruffs are frequently kept, however, and sent with the next lot of the same drug to be ground at the mill. The dose of a powdered drug is usually somewhat less than that of the same drug before it was pulverized, because the weight it has lost generally represents inert matter, water, etc. Powdered ipecac is a good illustration of this. The active principle *emetine* resides in the starchy cortical portion of the root; the internal ligneous cord constitutes the “gruffs” of ipecac, and is inert. The exception to this is the case of those drugs containing an active volatile constituent, like the aromatics, cloves, cinnamon, nutmeg, or like *asafetida*, *myrrh*, *cubeb*, etc. These drugs, when powdered, generally contain less of their active constituents than they did before they were ground: the volatile oils to which their virtues are due are driven off to a greater or less extent by the amount of heat necessary to make them brittle enough to be readily pulverized. The U. S. Pharmacopœia recognizes the importance of this fact by directing *myrrh*, and not powdered *myrrh*, in the compound iron mixture; *asafetida*, and not powdered *asafetida*, in the *asafetida* mixture; and in the compound tincture of cardamom by the direction to mix the unpowdered drugs, cardamom, cinnamon, caraway, and cochineal together, and reduce the mixture to powder, in preference to mixing the separate powders of these drugs. If care is exercised in desiccating, the powders of most drugs possess all their medicinal properties, and in many cases they will retain indefinitely these properties unimpaired if they are properly preserved and not unduly exposed to air, light, or moisture.

The practice of some drug-millers of establishing a loss in the weight of a drug as a regular standard, and then making up the deficiency by adding the same amount of some inert substance, is reprehensible. That the amount of moisture present in different lots of the same drug varies greatly may be seen by a glance at the following table, compiled by Mr. T. J. Covell from accurate records obtained from Dr. E. R. Squibb's drug-mills. The table is valuable because it represents the loss in powdering considerable quantities of drugs:

Table showing Loss in Powdering Medicinal Substances.

Substance.	Greatest Loss per cent. on any Single Lot.	Smallest Loss per cent. on any Single Lot.	Average Loss per cent.
Acacia	1.88	0.40	0.83
Acacia (granulated)	1.67	1.08	1.85

CHAPTER VIII.

COMMINUTION.

COMMINUTION is the process of reducing drugs to particles, or breaking up their state of aggregation.

Medicinal substances in their natural state require to be mechanically divided in order to facilitate the action of menstrua or solvents, or to permit their administration *per se* in the form of fine powders.

A simple illustration is offered in the case of alum. A solid lump of alum weighing one ounce, if added to a pint of water, will not dissolve nearly so quickly as will one ounce of the same alum in the same quantity of water *if finely powdered*. Vegetable substances offer very variable degrees of resistance in powdering, owing to the proportion and toughness of their ligneous fibre and the amount of cellular tissue.

Under the head of comminution will be grouped the various mechanical operations used in pharmacy by which the surface of solid substances is increased, whether by cutting, rasping, grating, chopping, crushing, rolling, stamping, grinding, powdering, triturating, levigating, elutriating, granulating, or similar processes.

By far the greater number of substances employed in medicine belong to the vegetable kingdom, and, whilst many of the processes of comminution used for these are also applicable to the chemical substances of the *materia medica*, it will be necessary in the following chapter to note the apparatus specially adapted to each class.

Cutting, Slicing, and Chopping.—This process is used principally in bringing roots, barks, leaves, herbs, etc., to the proper condition for

FIG. 192.

Herb-cutter.

treating with suitable solvents. For very small operations either the pruning-knife or pruning-shears answers a good purpose. The tobacco-knife or herb-cutter shown in Fig. 192 is well adapted for the purpose. It should be

observed, however, that the principle upon which a knife operates successfully should be carefully carried out in constructing apparatus designed for cutting: direct pressure without a slight drawing or sawing motion is not effective; therefore those knives which have guides arranged

so that the knife-edge sunders the particles at an angle are greatly preferred. Fig. 193 shows a roller knife which is very serviceable. It is made by W. Weber, Evansville, Indiana. The circular blades or knives are made of the same quality of steel that is used for saws, and

FIG. 193.

are mounted upon a shaft, being separated by a series of spools or collars. The handles are of wood and mounted on the ends of the shaft, so that they are loose upon the shaft, thus permitting the handles to be grasped tightly whilst the roller knife revolves. The substances to be cut are placed upon a smooth board and the roller knife passed over them with more or less pressure. Upon the large scale drugs are cut with hay-cutters, implements usually consisting of four or more circular blades fastened to a shaft and revolving at the end of a trough, down which the substance that is to be cut is gradually fed. Sarsaparilla root is cut in this way before it is contused.

Rasping or Grating.—A half-round rasp (see Fig. 147) or a nutmeg-grater is very useful at the prescription counter, as it frequently enables the pharmacist to prepare a small quantity of a powder for a prescription in case the regular stock-bottle is found empty or a very fresh powder is needed. The small pocket pepper-mills used by European travellers for grinding whole pepper at the table will be found especially useful.

Contusion, or bruising, is an operation very frequently resorted to. It may be defined as the process of reducing a drug to particles by striking it a succession of blows. The instrument generally employed is the well-known mortar and pestle, which, for contusing drugs, should be made of cast iron, bell-metal, or brass. The shape best adapted for this purpose is shown in Fig. 194, the mortar being represented on a mortar-block. The bottom of the mortar should be flat and heavy, so that it may rest firmly upon whatever base it is placed; the sides should flare slightly, but the mortar should be so deep that substances will not be easily forced out on to the floor by the blows of the pestle. A leather or wooden cover should be used upon the mortar when corrosive or irritating substances are contused. The pestle should be heavy and sufficiently flat on the under surface to permit the convexity nearly to coincide with the concave surface of the mortar. The inner surface of the mortar should be tinned, to prevent rusting and facilitate cleaning. The best support for an iron mortar is the top surface of a hard-wood post six inches in diameter and of sufficient length to pass from the top

of the floor into the cellar and rest on the ground. A turned wood mortar-block two feet high should rest upon the post; this block should have a flat iron hoop upon the top projecting half an inch above the

FIG. 194.

Mortar and pestle.

surface, as suggested by Dr. H. T. Cummings, whilst the bottom should have an inch hole bored up through the centre for the distance of twelve inches; an inch wooden pin, two feet long, should be firmly fixed in the centre of the post for the distance of twelve inches, which would leave twelve inches of the wooden pin projecting above the floor. Now, if the mortar-block is placed over it so that the pin enters the hole in the base, it will be found that a solid foundation is provided for resisting the blows of the pestle, and jarring and vibration, so destructive to balances and fragile apparatus, are prevented (see Fig. 194).

When for good reasons the post-support cannot be used, the next best base is a deep, strong box filled with dry sand. The principal objection to this is the constant loss of the sand and the inconvenience of having it spilled on the floor. When it is necessary to use an iron mortar and pestle for a continuous operation, for a considerable length of time, it will be found advantageous to connect the upper part of the pestle with an elastic wooden spring attached to the ceiling, so that the labor of lifting the pestle will be lessened. This spring is preferably made from a tapering hickory strip seven or eight feet long and four inches wide at the base, the rope connecting the pestle with the end of the spring being of such length that the pestle barely touches the bottom of the mortar when the spring is stretched to its utmost tension.

On account of the large number of mills scattered over the country, established for grinding drugs, and the increase of facilities for grinding and powdering drugs on the large scale, the skilful use of the mortar and pestle by the pharmacist must be regarded as a lost art. The necessity for thoroughly drying drugs before subjecting them to comminution has already been mentioned. (See Desiccation.)

Wooden mortars and pestles are occasionally used for contusing soft bodies, like prune pulp, almonds, recent fleshy roots, substances that are affected by iron, etc. *Lignum-vitæ* is a very hard and suitable wood for this purpose, although boxwood is preferable when it can be procured, because it has less tendency to split.

Marble mortars are also used for operations of a similar character on a somewhat larger scale; but care must be used to avoid putting substances containing acid into such mortars, on account of the reaction upon the marble and the consequent contamination of the product.

Grinding and Pulverizing.—The former term is applied to the reduction of a substance by mechanical means to *coarse* particles, the latter to the production of *fine* particles. These processes are the most important of any grouped under comminution. At present they are

very largely carried on by drug-millers. It is necessary for the pharmacist to be familiar with the methods employed, however, if intelligent judgment is to be exercised in the subsequent treatment of the vegetable and mineral substances of the *materia medica*. Before pulverizing a substance it must be dried, and the desired fineness of the powder determines the character of the preliminary treatment. In order properly to grind or powder substances upon the large scale, special knowledge and experience are required; previous acquaintance with the methods best suited to accomplish the object on the small scale, whilst useful to some extent, will be found inadequate. If a drug is to be coarsely ground, the necessity for thoroughly drying it is generally not so pressing as when a fine powder is to be made of the substance; drugs containing volatile oils are apt to be rendered worthless if they are dried sufficiently to enable them to be ground to a fine powder. Myrrh,

FIG. 195.

Munson's buhr-stone mill.

cloves, cubebs, nutmegs, etc., afford good illustrations of this: hence these drugs are preferred when coarsely powdered. Within the last few years an important change in pharmaceutical practice in this respect has been effected, and preparations in which formerly very fine powders were directed are now ordered to be made from coarse powders: the processes for extracting the soluble principles having been greatly improved, the

necessity no longer exists for using the very fine powders, and hence volatile principles are not sacrificed.

DRUG-MILLS.

The **Buhr-stone Mill** is very extensively employed in drug-milling. There are two kinds, termed respectively under-runners and upper-runners. The principle upon which this mill operates is that of reducing the substance to particles by the friction and contusion that follow the delivery of the substance in the contracted space formed by a rapidly-revolving stone disk, brought in nearly close contact with a similar disk which is stationary. In the under-runners the upper stone is stationary and the lower stone revolves, the upper stone having a central circular opening through which the substance is fed, as shown in Fig. 195, the under stone being connected with the shaft. In the upper-runners the lower stone is stationary, the upper stone being perforated as in the under-runners. In both, the stones revolve horizontally. The

Fig. 196.

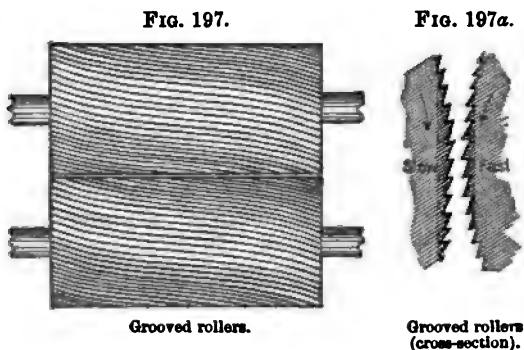

Buhr-stone.

stone used must be very hard. The best buhr-millstone is obtained from the old and celebrated quarries of La Ferté-sous-Jouarre, in France. The surfaces of the millstones are crossed with "furrows," which pass from the centre to the circumference, as shown in Fig. 196. The object of the furrows is to provide a means for the passage of the ground particles to the outer circumference and to the trough: this is accomplished through the centrifugal force and current of air caused by the rapid revolution of

the stone in motion. The fineness of the powder is regulated by raising or lowering one of the stones, this of course increasing or decreasing the space between them; the character of the powder is also influenced by the dressing of the stone. Fig. 195 illustrates one of the best of the modern buhr-stone mills,—Munson's under-runner.

Roller-Mills operate by crushing, or crushing and cutting, the substance. In their simplest form they consist of two smooth-faced iron rollers revolving in opposite directions, which can be brought into close contact by regulating screws. The principle has been extended and improved in modern milling, so that for grinding certain drugs this mill gives excellent results. The rollers are now made of steel, chilled iron,

or biscuit (porcelain), and are corrugated or ribbed to suit special purposes. The sections of these corrugations are serrated, undulated, or crenated. The rollers revolve in the same direction or in opposite directions, and at equal or different speeds. Fig. 197 shows the position of the grooved rollers, and Fig. 197a shows a sectional view of the same. A roller drug-mill, operated by steam-power or by hand, is made by W. Schroeder & Co., of Leipsic, Germany. The rollers have sharp oblique furrows upon their surfaces, and extra rollers are supplied to suit special purposes for grinding very fine powders, etc. (N. R., 1878, p. 336.) Allaire, Woodward & Co., of Peoria, Illinois, use with great success a corrugated roller-mill in grinding *nux vomica*.

Chaser-Mills are so called because two heavy granite stones, mounted like wheels and connected by a short horizontal shaft, are made to revolve or *chase* each other upon a granite base (see Fig. 198). The stones are discoid, and the grinding surfaces are the circumferential edges of the stones and the surface of the granite base; an iron cylinder, called a "curb," surrounds the circular base, and a "scraper," made of iron and adjusted at an angle, is connected with the shaft. It is evident that if the substance to be powdered is delivered upon the granite base in the path of the rapidly-revolving stones it must speedily be reduced to powder, not only on account of the crushing weight of the heavy stones, but also because of the attrition caused by the outer edge of the stone travelling through a longer distance than the inner edge. In some mills the stones having flat, grinding surfaces have been replaced by stones having curved surfaces, and the flat base by a circular gutter curved to correspond with that of the surface of the stone: in this way the grinding surfaces have been greatly increased and rapid pulverization facilitated. Fig. 199 shows the shape of the stones of this form in use in Dr. Squibb's laboratory.

In practice the chasers are enclosed in a tight box or small room, closed with air-tight doors, and the substance to be powdered is fed in from the top by an

elongated funnel, the spout of which delivers the material immediately upon the path of the stones. The height of the curb is increased by pasting heavy paper around it, and the fineness of the powder is influenced by the height of the curb. The revolution of the chasers produces an upward current of air; this carries over the lighter particles, which fall outside the curb and are subsequently collected as a fine powder; those particles which are larger are of course heavier and cannot rise to the height of the curb, but fall back under the stones to be reground: in this way refractory substances can be reduced to very fine powder. Chasers are more largely employed in making "dusted" or very fine powders than any other form of pulverizing apparatus.

Mills with Iron Grinding Surfaces.—Many mills have been constructed from time to time to suit special purposes: these cannot be noticed at length in a work having the scope of the present one. *Barrel-mills* have been used. These consist of strong barrels lined with sheet-iron, supported by strong iron shafts attached to the heads. The substance to be comminuted is placed in the barrel, and large round iron balls, like cannon-balls, are introduced: upon revolving the barrel rapidly, disintegration is effected. This principle is used also in pulverizing dried extracts and friable substances. A hollow circular iron ring, having a diameter slightly larger than that of the cannon-ball which is placed inside with the charge of substance to be powdered, is made to revolve rapidly; the inertia of the cannon-ball and the friction render its speed less than that of the ring, and the substance is quickly ground. The "*Bogardus*" mill is constructed on a very ingenious principle: the grinding surfaces are two horizontal chilled-iron plates, the lower one revolving, the upper one stationary; both have corrugations having sharp edges, arranged concentrically. The peculiarity of this mill is that the centres of the grinding-plates are not directly over each other as in buhr-stone mills, but the centre of the lower plate is placed a few inches to one side: by this arrangement the substance to be ground is caught by the ring-edges of the revolving plate and dashed against the cutting-edges of the stationary upper plate at an angle, the effect being to incise it as if cut with scissors and crush it at the same time.

Mead's Disintegrator differs from the mills thus far considered in the principle of construction, in the character of the grinding surfaces, and in its method of operation. The grinding is effected by hardened steel beaters riveted to a steel disk, which revolves vertically between corrugated rings; the beaters are placed on the side of the disk nearest to the feeding-trough, and catch the material as it enters the mill, beating it with great force against the corrugated rings until it is fine enough to pass between the disk and the face of the rings; as soon as it passes here, it is on the side of the mill from whence it is discharged, and all that is fine enough is immediately driven out by the beaters on the back of the disk. That portion of the substance which is not fine enough is caught by the beaters and beaten against the screens until sufficiently fine to pass through. The screens are two inches in width, and extend around three-fourths of the diameter of the mill: they are made of square steel bars, and present a grinding surface to the beaters,

but there is sufficient space between them to permit the passage of fine particles. The substance, as it is ground, falls into a receiving-box below the mill, or is discharged through the floor into a room below. One prime requisite in running this mill is high speed: the disk must make three thousand revolutions a minute. The disintegrator is capable of grinding one hundred and fifty pounds of Ignatia bean, or six hundred pounds of wild-cherry bark, in one hour. Fig. 200 gives an illustration of the mill, whilst Fig. 201 shows an enlarged view of the revolving disk, and a section of the screens immediately above.

Mead's disintegrator.

Revolving disk and screens.

Hand-Mills.—It is more difficult to construct a drug-mill for the general use of the pharmacist than one for the special purposes of a drug-miller. The latter has the choice of a buhr-stone mill, chaser, disintegrator, iron mill, etc., which he can adjust to suit the character of the substance he desires to grind. The pharmacist's drug-mill, on the other hand, is expected to do all kinds of work rapidly and well. It must, therefore, be capable of ready adjustment, possess durability, and have cutting surfaces not quickly dulled, and working parts not liable to get out of order.

It is not easy to realize that every medicinal substance has an individuality of its own, but he who neglects the study of the physical characters of the substances of the *materia medica* can never expect to overcome successfully the obstacles which stand in the way of disintegration. Hand drug-mills may be divided into three classes: 1. Those having vertical grinding surfaces. 2. Those having horizontal grinding surfaces. 3. Those having conical grinding surfaces. They have the following points in common: iron is the principal material of construction, the grinding surfaces are of hardened iron or steel and consist of teeth arranged in concentric rows, and the regulation of the fineness of the powder is effected by a screw or screws, by which the plates are made to approach or recede from each other.

1. **HAND DRUG-MILLS WITH VERTICAL GRINDING SURFACES.**—*Swift's Mill* (old style).—This hand-mill has been in use longer than any other in the American market. Its introduction marked an era in the history of pharmacy, and, although superseded now by greatly-improved mills, it is still remembered with grateful feelings by those of the present generation, who had been previously accustomed to laborious mortar practice. In this mill there are two vertical grinding-plates, one of which is stationary, whilst the other is connected with the horizontal revolving shaft; a conical breaker is also attached to the shaft, and when in position it is immediately below the lower opening of the hopper; a fly-wheel with a handle is bolted to the outer

end of the horizontal shaft, and furnishes the power required. The teeth are of iron and arranged in concentric rows, and the plates are made to approach each other or to separate by an adjusting-screw. The supports of the mill are of ash or oak, and are durable and firm. The principal disadvantages of this mill are the difficulty of cleaning it, its slow action, its liability to become clogged, and the absence of a tight box or drawer to receive the ground drug. Two improvements have been made in the Swift's new-style mills: in one the fly-wheel has been made larger and heavier, in the other a double fly-wheel has been attached.

Troemner's Mill, whilst constructed upon the same principle as Swift's, is much more thorough in its action, and requires less labor to operate it, than Swift's mill (old style). It has vertical plates, a thumb-screw to regulate the fineness of the powder, a heavy fly-wheel, and a close-fitting drawer to receive the powdered drug. It is not so easily cleaned, however, as the next mill to be mentioned.

The Enterprise Mill.—The introduction of this mill, in 1875, gave an impetus to the manufacture of hand drug-mills which is still felt: the application of several new principles, and the extension and improvement of some valuable old ones, at once gained the attention of practical pharmacists. The great advantage possessed by this mill over those in the market at the time it was introduced was the ease with which the interior and the working parts could be reached. The principle of sup-

FIG. 202.

Enterprise drug-mill.

porting the grinding-plates upon a horizontal shaft, to the extremities of which heavy fly-wheels were attached, and providing a means for lifting all the working parts out of the interior to facilitate their cleaning, were novel features. Fig. 202 so thoroughly illustrates this mill that it is hardly necessary to dwell upon its other features. The left-hand grinding-plate revolves, being geared to the shaft, whilst the one on the right hand is stationary: when in position for grinding they are, of course, nearly in contact. The opening of the interior is effected

by simply turning the thumb-screw in front. A smaller mill is shown in Fig. 203. It is very conveniently used at the dispensing counter.

2. HAND DRUG-MILLS HAVING HORIZONTAL GRINDING SURFACES.—*Thomas's Mill*.—This was one of the first hand drug-mills

made upon this principle. There are two horizontal grinding-plates, the lower one revolving and the upper one stationary. A vertical shaft, which is geared to a horizontal shaft by bevel-wheels, communicates the power to the lower plate upon revolving the fly-wheel. The absence of a closed receptacle, and the difficulty of quickly cleaning the grinding surfaces, are the principal objections to this mill.

Swift's B Mill.—This is a comparatively new mill, very different in appearance from the old Swift's mill, and different in principle. The grinding-plates are horizontal, the lower one revolving, whilst the upper one is stationary and forms the lower part of the hopper. It has two fly-wheels, but the receptacle for the powder is an open one. A valuable feature of the Enterprise mill is present here,—i.e., that of opening horizontally in the centre. The fineness of the powder is regulated by raising or lowering the lower plate by the thumb-screw.

3. **HAND DRUG-MILLS HAVING CONICAL GRINDING SURFACES.**—The principle of construction in these mills is probably the best, because it avoids the fault of those constructed on the vertical-plate principle, that of permitting particles to drop into the receptacle before they are finely ground, and also the fault of the horizontal-plate mills, which may hold the ground particles too long, often until clogging results. The conical-plate mill, if properly constructed, leaves little to be desired.

Hance's Mill is made on this principle. Formerly, the objection to this mill was the loss of time and labor consumed in getting it apart: this has been obviated by the introduction of the principle of opening it horizontally with the same kind of thumb-screw and hinge that is used in the Enterprise mill. The Hance mill is better adapted for heavy work than any other of the hand drug-mills, and, if desired, a belt and pulley can be attached for steam-power. The lower plate is conical in shape, the summit being elongated into a breaker; the teeth are arranged in consecutive rows, a scraper being attached to the under surface of the lower plate; the upper grinding surface is situated upon the lower surface of the hopper, and corresponds in shape and in the arrangement, number, and size of teeth with the surface of the lower plate. The revolving-plate is attached to the upright shaft by a simple key; this permits the easy removal of the plate when the mill is to be cleaned, yet holds it securely when in operation. Power is communicated by means of two shafts at right angles, geared with bevel cog-wheels. The fineness of the powder is regulated by a thumb-screw at the base, which elevates the revolving-plate. The support to the mill is a strong iron frame, which is cast in one piece, and, although the mill has but a single fly-wheel, this is partially compensated for by the length of the bearing for the horizontal shaft. Fig. 204 shows the

FIG. 203.

Drug-mill (dispensing).

form which is mounted on a stand and is designed to be bolted to the floor; the new form, in which the mill is mounted on a box-stand, may be preferred by some. Fig. 205 shows the upper grinding-plate, and Fig. 206 the lower plate with a feeder, which is fastened to the upper portion with a set-screw, so that seeds and similar drugs may be automatically fed to the mill.

FIG. 204.

Hance's drug-mill.

General Rules for Operating Hand-Mills.—Much of the dissatisfaction experienced in operating hand-mills has arisen from improper methods of using them, or from failure to measure accurately the degree of resistance to disin-

FIG. 205.

Hance's mill (upper plate).

FIG. 206.

Hance's mill (lower plate).

tegration possessed by the substance to be ground. One of the first requisites, as before mentioned, is to dry the substance as perfectly as its physical character will permit without injuring it. If coarse, bulky, fibrous roots, barks, or similar substances are to be ground, they must first be cut or bruised. Most substances are ground with less labor if they are passed through the mill first with the coarse adjustment, returning the portion which is sifted out for regrinding, after setting the plates more closely together: this plan is repeated until the whole is ground. Care should be taken not to feed the substance into the hopper faster than it can be ground. The desire to get through quickly is the most frequent cause of clogging the mill, and when this occurs much time is lost, and the operator is strongly reminded of the well-worn proverb about undue haste. If a considerable quantity is to be ground, two persons can operate the mill more economically than one,—one feeding the mill carefully, the other supplying the physical labor, and, after the expiration of a given time, exchanging places. Good judgment is necessary in determining the rapidity with which substances can be fed into the hopper. Resinous or oily drugs, or substances which soften by heat, require very careful treatment and cannot be fed rapidly; dry ligneous barks or roots, on the other hand, can be fed as rapidly as the extent of grinding surface of the mill and the muscle of the operator will permit. The mill should be thoroughly cleaned after each operation, particular attention being given to the grinding-plates. In the case of substances which form hard lumps by heating or clogging upon the plates, the quickest way is to use boiling

water to soften or dissolve the lumps; the plates should then be quickly dried, to prevent rusting. By running sawdust or rice chaff through a mill, after an odorous drug has been ground, it may be speedily cleaned and freed from odor.

Trituration is the process of reducing substances to fine particles by rubbing them in a mortar with a pestle. The pestle is given a circular motion, accompanied by downward pressure, and the most effective method of using the pestle is to begin in the centre of the mortar and describe a circle of small diameter with the pestle on the substance, and gradually increase the size of the circle with each revolution until the side of the mortar is touched, when the motion is reversed and circles continually smaller in diameter are described until the centre is reached: this is repeated until pulverization is effected: by this treatment all the particles are brought under the action of the pestle. The mortar and pestle best adapted for this operation have the shapes shown in Fig. 207. Mortars with pestles having flattened ends are the best. Wedgwood-ware is very serviceable, but is difficult to keep clean. As tritulating mortars are rarely subjected to blows, porcelain mortars of proper shape are preferred. One of the principal annoyances in the use of wedgwood or porcelain mortars and pestles is that of the continual loosening of the handle of the pestle. The cement employed by the manufacturer is chiefly rosin of bad quality, and in using the pestle the particles of loosened cement often drop into the mixture in the mortar during trituration. The best plan is to pull the handle out of the pestle entirely as soon as possible and reset it: this is easily done by heating the end of the pestle in a sand-bath until the cement has softened so that the handle may be extracted, then some hot cement (good sealing-wax) is poured into the pestle-hole, and the wooden handle is at once pressed forcibly in and

FIG. 208.

Pestle (hard-rubber handle).

FIG. 207.

Mortar and pestle.

held in its place by wedging or other means until the sealing-wax has hardened. The hard-rubber handle, which is made to screw accurately into the pestle (see Fig. 208), is a great improvement over the ordinary

handle, and the additional cost is more than repaid by the comfort of using it. Where trituration is combined with contusion, as frequently

FIG. 209.

Wedgwood mortar and pestle.

happens in effecting solutions of chemical substances, a wedgwood mortar of the shape shown in Fig. 209 is well suited for the purpose. The selection of good mortars and pestles is frequently overlooked amidst the many items of detail in furnishing a pharmacy; but few implements bring more satisfaction to the operator than good mortars and pestles. It is a safe rule to examine every purchase carefully before accepting it finally, to see whether the pestle fits the mortar accurately: it should have as much bearing on the interior surface of the mortar as its size will permit, because the rapidity of the trituration depends largely on the amount of contact of the surfaces.

The use of a round-surfaced pestle in a flat-surfaced mortar is just as great a waste of labor as that of a flat-surfaced pestle in a round-surfaced mortar. Trituration, as a distinct method of preparing a class of preparations, was officially recognized in the U.S. Pharmacopœia of 1880, and a new preparation, *Trituratio Elaterini*, made by triturating elaterin with sugar of milk, was introduced.

FIG. 210.

Triturating with loaded pestle.

Fig. 210 shows a device for facilitating trituration. It was communicated by Charles Rice, and is simpler and more effective than similar contrivances which have been described. It consists of an ordinary mortar and pestle, the latter having been lengthened by cutting down the mushroom top of the handle, so as to admit of its being inserted into the large end of a wooden handle, shaped somewhat like a ball-bat, and between two and three feet long. The upper end of this handle should be about an inch in diameter, and during the use of the pestle is to be kept upright and steady by passing through an opening in a piece of heavy pasteboard or wood which may be tacked to the under side of some convenient shelf. The mortar should stand on a counter about three feet from the floor, and the upper end of the pestle pass through a shelf above. To stop the noise caused by the pestle striking against the sides of the opening, a piece of sole-leather is attached to the under side of the shelf and the pestle passed through a hole in its centre. This also serves

the opening, a piece of sole-leather is attached to the under side of the shelf and the pestle passed through a hole in its centre. This also serves

another purpose; viz., when it is necessary to raise the pestle to admit of changing or stirring the contents of the mortar, the leather will clasp the enlargement of the handle so as to suspend the pestle securely out of the way of the hands. In using the apparatus, one hand grasps the handle just above its lower end, and a very slight effort is requisite to give it the necessary motion. The weight of the handle is usually sufficient to insure a proper degree of friction. If, however, more pressure is desired, the pestle can be weighted by slipping a perforated weight on to an iron pin driven in the top of the handle.

Mortars and pestles are sometimes made of green or white glass. The former are to be preferred because they are stronger; the latter, however, present a handsomer appearance. Glass mortars are not adapted to the continued trituration of hard substances. They are useful only in dissolving certain chemical substances directed in prescriptions, like corrosive sublimate, the alkaloids, etc. It is best to place the glass mortar over a dark surface, in order to show by contrast more clearly when the solution of the white object is effected.

FIG. 211.

Porcelain mortar and pestle.

Porcelain mortars and pestles (see Fig. 211) are, however, more generally useful as solution mortars. Pestles entirely of porcelain are objectionable, because they are so easily broken.

Spatulas.—The process of trituration as ordinarily performed requires the use of spatulas. These consist of flexible steel blades attached to handles, and in trituration they serve to loosen the substance as it becomes packed upon the sides of the mortar. Spatulas are largely used in extemporaneous pharmacy, and they will be alluded to frequently under various special heads in Part VII. The blade of a spatula is frequently broken when too much pressure is applied, but if the broken blade remaining in the handle have its sharp corners ground off upon a grindstone, or filed off, it will be just as useful for some purposes as it was when perfect.

Spatulas may now be had of excellent quality, and greatly improved in style over those formerly used. The best form is the balance-handled spatula (see Fig. 213). In this the metal of the handle and that of the

FIG. 212.

FIG. 213.

Balance-handled spatula.

blade are continuous and of the same width, so that the annoyance of the tang becoming loose in the handle, as in the old-style spatulas, is avoided. The flat metal handle is enlarged by riveting smooth, flat pieces of hard

wood to it to insure convenience in using. The balance-handle derives its name from the fact that when lying upon the counter the weight of the handle is sufficient to overcome the weight of the blade, so that contact of the blade with the counter is prevented. Solid-handled spatulas (see Fig. 214) are also made, the whole being of one solid piece

FIG. 214.

Solid-handled spatula.

of metal, and the handle being nickel-plated. A pocket spatula, which closes like a clasp-knife, is also furnished by dealers.

Fig. 215 shows a spatula coated with hard rubber, made by Fox,

FIG. 215.

Steel spatula blade, coated with hard rubber.

Foultz & Webster, for making ointments which contain corrosive substances, or substances acting on steel.

Sifting is the process of passing a powdered substance through the meshes of perforated material with the object of separating the coarser from the finer particles. Sieves are employed in this process: the frames are usually round, although sometimes they are oval, square, or rectangular. The ordinary sieve is usually made by stretching wire gauze over a flat wooden ring, and keeping it in its place by slipping over it a narrow wooden ring of slightly greater diameter, which is tacked securely. Covered sieves, or drum sieves, have tight covers for the top and bottom. The simplest pharmaceutical sieve for general use is obtained by making five rectangular frames, each four inches deep, ten inches wide, and sixteen inches long. These should be light but strong, and the bottoms covered with brass-wire gauze of different degrees of fineness. A box, ten inches deep, twelve inches wide, and twenty-two inches long, with a tight cover, is provided to hold the sieves and prevent dust from escaping. Two cleats are nailed horizontally upon the sides of the box, five inches from the top, for the sieve to slide upon, and a hole is cut in the front of the box in order to permit a handle, with a hook at the end, to pass through and be attached to a screw-eye in the front side of the sieve; two large corks are screwed to the back of the sieve at either end to act as buffers. The powdered substance is introduced into the proper sieve, which is placed upon the cleats, and the handle passed through the hole and hooked to the sieve; the cover is then placed in position, and the sieve pushed backward and forward, touching the back lightly.

A very important point, which must not be omitted after sifting substances, is the thorough mixing of all portions of the sifted powder, in order that each part of the finished powder may have a uniform composition. The starchy portions of a drug will be powdered more

quickly than the ligneous portions, and will usually pass through the sieve first: hence the sifted powder must always be thoroughly mixed. Upon the small scale this may be easily effected with a spatula or mortar and pestle; upon a larger scale special apparatus is needed. Hunter's sifter is one of the most effective: it is shown in Fig. 216. In this the powder is sifted in the cylindrical sieve, and adhering particles or small lumps are brushed through by the revolving

FIG. 216.

Hunter's sifter.

brushes; the revolving spiral mixers in the large box cause the particles to be thoroughly mingled. The illustration shows the method of operating so well that further description is unnecessary. In Fig. 217 is seen an enclosed sifter well adapted for many purposes, whilst Fig. 218 shows a sectional view of the same kind of sifter for smaller operations. The sieve is hemispherical in shape, and is contained in a tinned-iron scoop (see Fig. 219, which shows the end view). Two circles of stout wire are soldered to a central axis at right angles to each other, and the axis passes through the tin handle and terminates in a crank. When a powder is placed in the scoop, and the wire rings are made to revolve by turning the axis with the hand, the particles of powder are

rapidly forced through the meshes of the sieve. This apparatus is especially useful in breaking up moistened lumps in powders which are about to be percolated. (See Percolation.)

FIG. 217.

Sifter.

The degree of fineness of powders is designated in the United States Pharmacopeia by the number of meshes to the inch possessed by the sieve. The five different sizes are as follows :

Very fine powder should pass through a sieve having 80 or more meshes to the linear inch (30 meshes to the Cm.).

Fine powder should pass through a sieve having 60 meshes to the linear inch (24 meshes to the Cm.).

Moderately fine powder should pass through a sieve having 50 meshes to the linear inch (20 meshes to the Cm.).

Moderately coarse powder should pass through a sieve having 40 meshes to the linear inch (16 meshes to the Cm.).

Coarse powder should pass through a sieve having 20 meshes to the linear inch (8 meshes to the Cm.).

In special cases powders of different degrees of fineness (e.g., No. 30, No. 12) are directed to be taken. In every case the number of the powder indicates the number of meshes to the inch of the sieve used to make the powder. Not more than one-fourth of the powder is expected to pass

FIG. 218.

Scoop sifter.

FIG. 219.

Scoop sifter (end view of sieve).

through a sieve having ten more meshes to the inch than the one designated.

For very fine powders, bolting-cloth is used for the sifting medium ; and when acid substances are to be sifted, horse-hair sieves are used.

Levigation is the process of reducing substances to a state of minute division by tritulating them after they have been made into a paste with

FIG. 220.

Slab and muller.

water or other liquid. This is effected in a shallow mortar with a flat-surfaced pestle, or upon a ground-glass slab with a flat-surfaced glass muller (see Fig. 220). The motion imparted to the muller, A, closely resembles the figure 8; this is frequently varied with that of elongated circles which intersect each other, the object being to vary the motion so that all particles of the powder may be brought under the action of the muller upon the slab G. Certain substances, like red mercuric oxide and zinc oxide, if made into a paste with alcohol or water, are more readily reduced to fine powder in this way than by the action of the mortar and pestle. The process is termed *porphyzation* when performed with a porphyry slab and muller.

Elutriation is the process of obtaining a substance in fine powder by suspending an insoluble powder in water, allowing the heavier particles to fall to the bottom of the vessel, and decanting the liquid containing the lighter particles into another vessel, and there collecting them. It is *water-sifting* practically, wherein the superior gravity of the larger particles is used as a means of separating them from the smaller. Prepared chalk is a familiar illustration of an elutriated powder.

Trochiscation is the process of making the pasty mass or magma obtained by elutriation into dry, conical masses. This is usually accomplished by the use of the little apparatus shown in Fig. 221. This consists of a tinned-iron cone, supported in a circular wooden frame which has one short wooden leg and a handle. A slab of chalk or other porous sub-

FIG. 221.

Trochleator.

stance is provided, and after filling the cone with the pasty mass the handle is taken in the right hand and the leg of the frame is tapped gently upon the slab of chalk: the shock causes a conical mass of the substance to fall upon it, whereupon the moisture present soon becomes absorbed, so that the little cone dries quickly. A succession of taps, with a slight lateral movement, deposits the cones in regular rows, and when the slab is full the first cones are found to be dry enough to be transferred, and all will soon be in the same condition. Chalk, bismuth, lake, and other insoluble powders are formed into conical nodules in this way.

Pulverization by Intervention is the process of reducing substances to powder through the use of a foreign substance, from which the powder is subsequently freed by some simple method. No general process can be given for this method of pulverization, as the character of the substance must determine the method. The metal gold may be powdered by rubbing gold-leaf in a mortar in contact with potassium sulphate: the latter is subsequently dissolved out with water. Camphor may be pulverized through the addition of a few drops of alcohol, chloroform, or other solvent. The foreign substance in this case is disposed of through evaporation. Metallic tin may be granulated by melting it and agitating it in a box containing powdered chalk: the latter is subsequently dissolved out with diluted acetic acid. Phosphorus may be pulverized by placing it in water contained in a small flask, then heating the water gradually until the phosphorus is melted, and shaking the flask while the phosphorus is cooling: the agitation in the presence of water keeps the particles from cohering.

QUESTIONS ON CHAPTERS VII. AND VIII.

DESICCATION AND COMMUNUTION.

- What is desiccation?
- What are the objects of desiccation?
- How may roots, herbs, and leaves be conveniently dried on the large scale?
- What is meant by "gruffs?"
- What use is made of "gruffs?"
- Why does the U. S. P. direct myrrh in substance and not in powder in making compound iron mixture?
- Table showing loss in powdering medicinal substances.
- What is comminution?
- What are the objects of comminution?
- How may roots, barks, etc., be conveniently cut?
- How upon the large scale?
- How may drugs be most conveniently bruised or contused?
- When it becomes necessary to use an iron mortar and pestle for a considerable length of time, how may the labor of lifting the pestle be lessened?
- For what purposes are wooden mortars used?
- For what purposes are marble mortars used?
- In using marble mortars, what precautions are necessary?
- What is the difference between grinding and pulverizing?
- What drugs are most injured by drying?

- What is a buhr-stone mill?
 What two varieties are there, and what are they called?
 What is the peculiarity of each?
 What are roller-mills?
 What are the rollers usually made of?
 What is the form of the rollers?
 What are chaser-mills?
 How are the stones arranged?
 How are powders of greater or less degrees of fineness obtained from chaser-mills?
- What are barrel-mills?
 How is the "Bogardus" mill constituted, and what is its peculiarity?
 What is Mead's disintegrator?
 What is requisite in running this mill?
 What three classes of hand-mills are there?
 Describe Swift's mill (old style).
 What improvements have been made in the new-style Swift's mill?
 Describe Troemner's mill.
 Describe the Enterprise mill.
 What are its advantages?
 Describe Thomas's mill.
 What are the principal objections to this mill?
 Describe Swift's B mill.
 Describe Hance's mill.
 Is Hance's mill best adapted for light or heavy work?
 What are the most usual difficulties met with in operating hand-mills?
 How may these be obviated?
 What is a good method of cleaning a mill after an odorous drug has been ground?
- What is trituration?
 What shaped mortars and pestles are best adapted to the purpose of trituration?
 What objection is there to the ordinary pestle of porcelain or wedgwood mortars?
- How is this best remedied?
 Is the hard-rubber handle any better, and if so, why?
 What preparation, called a "trituration," has been made official in the U. S. P.?
- Describe a device for facilitating trituration.
 What is the objection to glass mortars and pestles?
 Which are most useful,—mortars and pestles of porcelain, white glass, or green glass, and why?
- What is a spatula, and what is its best form?
 For what are spatulas covered with hard rubber useful?
 How is the process of sifting accomplished?
 How are the degrees of fineness of powders designated in the U. S. P.?
 How many degrees of fineness are so designated?
 What is meant by a very fine powder? Fine powder? Moderately fine powder? Moderately coarse powder? Coarse powder?
- In some special cases other degrees of fineness than these five are designated, as, for example, No. 80 and No. 12: what is meant by these numbers?
 What is levigation?
 What is meant by porphyzation? By elutriation?
 Give an example of an elutriated powder.
 What is trochiscation?
 What is pulverization by intervention?
 Give an example of this process.

CHAPTER IX.

SOLUTION.

Solution.—In pharmacy this term is applied to the process whereby any substance is liquefied or made to disappear when brought in contact with a liquid: the particles of the substance being uniformly diffused through the liquid, no separation takes place upon standing. The liquid used to effect this change is called a *solvent*, and, after its combination with the dissolved substance, a *solution*; if the liquid has exercised its powers as a solvent to its utmost extent, and is incapable of retaining any more of the dissolved substance, it is termed a *saturated solution*. A substance which is not acted on by a solvent is said to be *insoluble*.

Solution of Solids.—This is an operation which is very frequently performed by the pharmacist: in this place only the methods of effecting the solution of solid bodies which can be entirely dissolved in the solvent will be noticed. This excludes the operations of Infusion, Decoction, Percolation, Maceration, etc., which will be considered at length in subsequent chapters. Solution may be of two kinds: 1, Simple; 2, Chemical.

1. **Simple Solution** is where the solid suffers no alteration on being dissolved, except that which depends upon its external form, and where, if the reverse operation of evaporation is applied, the solid substance is recovered unchanged. The making of simple syrup is an example.

2. **Chemical Solution** is where the properties of the dissolved body are changed by the chemical action of the solvent or some of the substances added, and the simple process of evaporation results in the production of a body having different properties, as, for example, in the official solution of mercuric nitrate.

Effects of Pulverization and Agitation.—The solution of solids may be facilitated by pulverizing them and stirring the mixture, thus increasing their extent of surface and promoting the frequent contact of the surfaces with fresh portions of the solvent. This is easily illustrated, as already noted under Comminution, by placing half an ounce of lump alum and half an ounce of powdered alum each in a pint of water at the same time: a few vigorous stirs will soon cause the latter to dissolve, whilst the former will require a much longer time.

Effect of Heat.—The application of heat generally favors solubility, for nearly all substances are more soluble in hot liquids than in cold ones. In addition to this, the convection currents in the liquid caused by heat hasten the solution by constantly bringing fresh surfaces into

contact with the liquid. In many cases the ratio of solubility is not the same for equal increments of heat.

Density of Solutions.—The effect of dissolving a solid body, specifically heavier than the solvent, is always to increase the density of the liquid in which the solid is dissolved. The specific gravity of water is 1.000: if five per cent. of sugar is dissolved in it, the specific gravity is 1.021; if ten per cent., 1.070; if twenty per cent., 1.088, etc. This fact is capable of optical proof; for if a piece of sugar is suspended near the top of some water in a beaker, the downward currents of the solution can readily be noticed if viewed by transmitted light.

Solubility of Substances in Saturated Solutions.—Whilst a saturated solution is one which is incapable of dissolving any more of the substance which was dissolved in the liquid, it must not be assumed that the saturated solution will not dissolve *other* solids. For example, if granulated potassium nitrate be mixed with two per cent. of copper sulphate, and then placed in a funnel having a plug of cotton in the throat, it will be found that the copper sulphate can be very easily removed by pouring on the potassium nitrate mixture a *saturated solution* of potassium nitrate. The potassium nitrate cannot suffer loss, because the liquid passing through is a saturated solution of the same substance; but copper sulphate is soluble in a saturated solution of potassium nitrate, and it is thus washed out.

Reduction in Temperature caused by Rapid Solution.—When solids dissolve rapidly in liquids without chemical action, a reduction in temperature always takes place, and cold is produced, in accordance with the well-known law governing the conversion of solids into liquids, whereby sensible heat is converted into latent heat. The so-called freezing mixtures are produced in this way: thus, if five parts of potassium sulphocyanide are quickly mixed with four parts of cold water, the temperature of the solution falls to -20° C. (-4° F.); thirty-two parts of sodium chloride, if mixed with one hundred parts of snow, will produce a brine having a freezing-point of -23° C. (-9.4° F.). Equal parts of crystallized calcium chloride and snow, when well mixed, will have a temperature as low as -45° C. (-49° F.).

Elevation of Temperature produced by Solution accompanied by Chemical Action.—If chemical action takes place whilst solution is progressing, the opposite effect, or elevation of temperature, is frequently produced, as in dissolving anhydrous salts. The same fact is noticed when the solution of an alkaline oxide made by calcination is effected by treating it with an acid, as when calcined magnesia is dissolved in a solution of citric acid.

Modes of Effecting Solutions of Solids.—The method usually employed by the pharmacist is by the use of the solution mortar and pestle (see page 190). The ordinary practice is to crush the substance into fragments in the mortar with the pestle, and then pour upon it the solvent, meanwhile stirring with the pestle until solution is effected. If definite quantities are used, and the whole of the solvent is required to dissolve the given weight of the salt, a portion only of the solvent should be added at first, and when this is saturated the solution is poured off, and a fresh portion of solvent added: this operation is

repeated until the solid is entirely dissolved; the solutions are then mixed. Other methods of effecting solution are to shake the solid with the liquid in a bottle or flask, or to apply heat to the substances in a suitable vessel.

Circulatory Solution.—A very excellent mode of dissolving substances, particularly where the solid is not very soluble or the relative proportion of liquid is small, is to suspend the solid near the top of the liquid upon a porous diaphragm or a suitable sieve, or tied up in a gauze bag if its nature will admit of this treatment. The parts immediately in contact with the solvent are dissolved, and the solution descends, its place being supplied by fresh portions of the solvent: a circulation is thus created and solution facilitated (see Fig. 222).

Solvents used in Pharmacy.—*Water.*—The most useful of all solvents is water. It has a more extensive range than any other liquid, and the aqueous solutions are among the most important preparations of pharmacy. They are especially treated of in chapters, under the head of *Liquores*, *Aquæ*, *Syrupi*, etc.

Alcohol as a solvent is next in importance to water. It has an important advantage over water in the fact that preparations made with it keep almost indefinitely, whilst most aqueous solutions of organic substances soon decompose or become worthless. Resins, volatile oils, alkaloids, glucosides, salts, etc., are dissolved by alcohol, whilst many inert principles, like gum, albumen, and starch, are insoluble in it, so that it has also great usefulness in its negative character.

Glycerin is an excellent solvent, although its range is not so extensive as either of the preceding: it has in its concentrated state antiseptic qualities of a high order, but has not the valuable negative qualities of alcohol. It dissolves the fixed alkalies, some of the alkaline earths, a large number of neutral salts, and vegetable acids, pepsin, tannin, etc., but it also dissolves gum, albumen, starch, etc., and thus its solutions are generally loaded with inert constituents. (See *Glycerites*.)

Ether is a good solvent for special purposes. Oils, fats, resins, and some of the alkaloids and neutral principles are dissolved by it.

Benzin is very similar in its solvent properties to ether.

Chloroform resembles ether and benzin as a solvent. It has an advantage over both, however, in not being inflammable, although its costliness prevents any extended application.

Carbon Disulphide is an excellent solvent for rubber, phosphorus, etc. Its range is limited, however, and its odor and inflammability detract from its usefulness.

Acids, either strong or diluted, are used as solvents; as in vinegars.

Oils are also used in this way in liniments, etc.

FIG. 222.

Circulatory solution.

Table of the Solubility of Official Chemicals in Water and in Alcohol.

Abbreviations: s = soluble; ins. = insoluble; sp. = sparingly; v. = very; alm. = almost; dec. = decomposed.

SOLUTION OF GASES IN LIQUIDS.

The methods employed to effect the solution of gases in liquids differ

Method of absorbing gas.

essentially from ordinary processes of solution, and depend upon the solubility of the gas in the liquid, the relative specific gravity, and the strength of the solution desired. It is usually sufficient to conduct the gas into the liquid by a suitable tube, reaching nearly to the bottom, when more or less of the gas is absorbed by the liquid. Fig. 223 shows a simple method where the gas is readily soluble in the liquid, as in making chlorine water. For a continuous operation, as in making hydrochloric, nitric, and hydrobromic acids, and similar liquids, the well-known Woulffe's, or three-necked, bottles are employed advantageously, the gas which escapes solution in one

bottle passing over into the next. The washing-bottle shown in Fig. 224 is easily made, and well adapted for purifying the gas after it is

generated. B is an ordinary wide-mouthed bottle, closed with a perforated rubber cork, C; a wide tube, D E, passes nearly to the bottom, and a narrow tube, A, is joined by a short piece of rubber tubing, J, to the tube leading from the generating flask, and at the other extremity is curved upward so as properly to deliver the gas into the water placed in the bottle to wash it: it escapes by the bent tube, T, which is continued until it dips into the liquid in which the gas is to be dissolved. The space between the tube A and the wide tube D E acts as a safety-valve: if the pressure accumulates through the too rapid generation of the gas, or if a stoppage occurs in the delivery-tube, the liquid in the bottle is first blown out through this space, and the pressure is thus relieved.

FIG. 224.

Wash-bottle.

Fig. 225 shows a very convenient little apparatus for generating and washing small quantities of gases, for testing, or other purposes: the wash-bottle is made from

FIG. 225.

Gas-generator.

a homoeopathic vial, rubber corks being used, and the bent tubes by bending ordinary glass tubing over a flame as described on page 143. The funnel-tube permits the addition of fresh liquid to hasten or continue the action as the operation progresses. It is usual to add merely sufficient water to cover the orifice of the delivery-tube in the wash-liquid at the beginning of an operation, as the aqueous vapor carried over by the gas condenses in the wash-bottle, which soon increases in quantity, and may accumulate in a long operation to an extent which will necessitate a partial discharge of its contents or the entire cessation of the process. As the apparatus

suitable for each operation must be especially selected, general observations on the solution of gases will not be so useful in this chapter as a detailed process in connection with each preparation where it is described in the subsequent pages. One general rule should be noted, however,—*i.e.*, that gases are generally more rapidly and thoroughly absorbed by cold liquids than by hot ones: hence the receiving bottle should be kept surrounded by ice or otherwise refrigerated.

QUESTIONS ON CHAPTER IX.

SOLUTION.

- What is meant by solution ?
What is the liquid used to make a solution called ?
What is a saturated solution ?
When is a substance said to be insoluble ?
What two kinds of solution are there ?
Give examples of each.
How may the solution of solids be facilitated ?
What is the effect of dissolving a solid body specifically heavier than the solvent ?
How may this be shown ?
Is a saturated solution of one substance capable of dissolving some other substance ?
Give an example.
When solids dissolve rapidly in liquids without chemical action, what takes place ?
How are freezing mixtures made ?
What is the effect if during the solution chemical action takes place ?
How are solutions usually made by the pharmacist ?
What is meant by circulatory solution ?
Name the principal solvents used in pharmacy.
What are some of the advantages of alcohol as a solvent of glycerin ?
For what substances is ether a good solvent ?
What advantages has ether over chloroform ?
What are objections to carbon disulphide as a solvent ?
Upon what do the methods for making solutions of gases in liquids depend ?
Where a gas is freely soluble in a liquid, how is a solution usually effected ?
What is the arrangement of a Woulffe's bottle ?
Are gases generally more rapidly and thoroughly dissolved by cold or hot liquids ?

CHAPTER X.

SEPARATION OF FLUIDS FROM SOLIDS.

THE operations involved under this head are among those which are most frequently used in pharmacy,—i.e., Lotion, Decantation, Colation, Filtration, Clarification, Expression, Percolation, etc.,—and the principles which govern the successful performance of these practical processes should be mastered early in the career of the student. They are almost exclusively mechanical processes.

Lotion, or Displacement Washing, is the process of separating soluble matter from a solid by pouring a liquid upon it which will dissolve and wash out the soluble portion. The separation of the fluid from the solid is generally effected by placing an obstruction in a funnel or cylindrical vessel, such as a plug of cotton or tow, notched cork, filter-paper, etc., and then, having introduced the solid into the funnel and arranged a suitable vessel beneath, the liquid is poured upon it. (See Percolation.) Precipitates are frequently purified from contaminating soluble matter in this way. A very convenient method of applying the liquid is by the use of the spritz bottle (see Fig. 226). This is usually made from a flask, but a round-shouldered pint bottle of the diameter most easily grasped by the hand is preferable.

Two glass tubes, one bent at an acute angle and the other at an obtuse angle, are used; one end of the former is drawn out to a capillary orifice, and the other extends nearly to the bottom of the bottle. The obtuse-angled tube merely enters the bottle below the cork; the upper portion of this tube should be held in the gas-flame, so as to fuse the edges of the glass and thus prevent cutting the lips when it is used. By filling the bottle with liquid, and blowing with the mouth through the tube, a stream of liquid is ejected from the capillary orifice which can be directed to any portion of a solid substance that is to be washed. It is often desirable, in order to save time, to use the liquid hot. One of the wicker-covered bottles in which *Farina* cologne is imported answers a good purpose here to prevent burning the fingers, and if care is used to pour in a small quantity of hot liquid first and agitate it before adding the rest, so that the glass may be *gradually* warmed, there is no danger of fracturing the bottle.

Continuous Washing.—The use of the spritz bottle for small operations is convenient. A simple method of automatically supplying the wash-liquid in larger quantities is shown in Fig. 228. This requires

FIG. 226.

Spritz bottle.

no attention from the operator except at the beginning of the operation. The bottle is furnished with a perforated cork and a short glass tube. All that is necessary is to fill the bottle and adjust it over the funnel so that the end of the tube shall be at the height desired for the liquid : on tilting the bottle slightly (if the tube selected is not too narrow in diameter) the liquid will run out into the funnel until it rises to the orifice of the tube, when the flow will cease. As the liquid gradually passes through the solid substance in the funnel, the level falls, and bubbles of air pass through the tube into the bottle, the liquid once more flows, and the operation continues until the bottle is empty. Many elaborate methods of continuous washing have been suggested, and many have been practically tried by the author, but if care is taken in the simple apparatus just described to have the tube of proper diameter, at least so wide that the force of capillary attraction shall not be strong enough to prevent the ingress of air, it is the most satisfactory of all. Bottles having narrow mouths may often be used in the same way, and the cork and tube be dispensed with. A little practice will enable the operator to make a bottle in which the parts are adjusted to a nicety. On the large scale, Prof.

FIG. 228.

Continuous washing.

FIG. 229.

Continuous-washing apparatus.

B. S. Proctor's suggestion of two carboys may be used,—one above and inverted, containing the liquid, supported by a box having a circular hole cut in its side, and the other inside the box, containing the funnel and filter.

A modification of Gay-Lussac's apparatus is one of the most successful and practical for continuous washing (see Fig. 229). The bottle containing the wash-liquid is furnished with a doubly-perforated cork and two glass tubes: one is bent as shown in the cut, and its lower extremity curved upward. By blowing a current of air through the other tube the syphon-tube is filled, and the extremity may then be adjusted to such a height in the funnel as is desired. When the level of the liquid in the funnel falls below the orifice of the tube, bubbles of air will enter the bottle through the air-tube, and the liquid will run out until it rises in the funnel to the level of the ends of the tubes, when it will cease. It will be found a practical convenience to cut the syphon-tube just below the bend, so that a piece of rubber tubing may be used to form a flexible joint.

Decantation.—The process of separating a fluid from a solid by decantation is very simple, and consists usually in allowing the solid to deposit at the bottom of the vessel, and then carefully pouring off the liquid by inclining the vessel. The theory of washing by decantation shows its effectiveness, and this may be illustrated by the following example. If 360 grains of mercuric chloride dissolved in 50 fluidounces of water are mixed with 220 grains of potassium iodide dissolved in 50 fluidounces of water, double decomposition takes place, an insoluble precipitate of mercuric iodide subsides, and 100 grains of potassium chloride remain dissolved in the 100 fluidounces of water. As it is desirable to free the mercuric iodide from the contamination of potassium chloride, the supernatant liquid is poured off; if 90 fluidounces are decanted, 90 grains, or $\frac{9}{10}$ of the whole quantity of potassium chloride, are thus disposed of, and 10 grains are left. If the vessel is filled with water to 100 fluidounces, and 90 fluidounces are again poured off, 9 grains are again removed, and but 1 grain is left; this by a third washing and decantation in a similar manner would be reduced to $\frac{1}{10}$ of a grain, and thus the purification is speedily effected. Some skill is required to decant liquids neatly from vessels of various shapes, particularly if they are not furnished with lips, or if filled nearly to the brim. The *guiding-rod* may be used in many cases with effect: indeed, it is a good practice to form the habit of using a stirrer or rod as a guide in decanting, as shown in Fig. 230, for it has a tendency to steady the hand of the operator. The practice recom-

FIG. 230.

Use of the guiding-rod.

ends to be followed in decanting, as shown in Fig. 230, for it has a tendency to steady the hand of the operator. The practice recom-

mended by some writers of greasing the rim of the vessel to facilitate decantation is a clumsy and usually unsuccessful expedient.

The Syphon (or Siphon).—It often happens in washing solid substances that decantation by pouring off the liquid cannot be successfully performed, either because the vessel is too full, or because, owing to the light character of the precipitate, the inclination of the vessel is sufficient to cause a disturbance in the powder, and an admixture of the liquid and solid. In such cases, and in many others, the useful instrument known as the syphon may be resorted to. This usually consists of a glass tube bent at a rather acute angle, and having one of the limbs longer than the other. It is used by filling the syphon with liquid, and then inserting the short limb into the liquid that is to be drawn off, when a flow of liquid from the long limb is established, which need not cease until as much of the liquid is abstracted as is desired. After filling the syphon the liquid may be prevented from running out (if a tube of small diameter is used) by stopping up the end of the long limb with the forefinger of the right hand, or, if the liquid to be drawn off is not caustic or unpleasant to the taste, the short limb of the syphon may be placed in the vessel at the proper height, and suction applied by the mouth at the long end until the current is established. The principle of the action of the syphon is shown in Fig. 231. The combined lengths

FIG. 231.

Syphon diagram.

of the limbs of the syphon are not equal to the length of the glass tube, TOS, but the real syphon is only the tube acting between the levels of the liquid in the vessels. In all operations with the syphon there must be a difference in the levels of the liquid. In Fig. 231, OS represents the liquid in the short limb, and OT the liquid in the long

limb. It is obvious that, if an equal-limbed, narrow-tubed syphon is filled with liquid, and held level in liquid on the same plane, there can be no movement in the liquid; equilibrium is established, because the tubes are equal in length and in level liquid, and the pressure of the air is the same upon all parts of the liquid. But the descending column of liquid in the long limb exceeds in weight that in the short limb, and it follows on account of the excess of weight of liquid in this limb that if it is once set flowing through the longer limb it will continue until the levels of the liquid in the two vessels are the same. It will be observed that the custom of having one limb longer than the other is not a necessity, for if there is sufficient difference between the levels of the liquid the syphon will operate with the position of the limbs reversed; but it is a convenience in a syphon of unequal limbs always to immerse the short limb, as there is then a certainty that the other limb contains the longest column of liquid. The syphon, obviously, cannot be operated in a vacuum, nor if the length of the upward column of water exceeds thirty-three feet.

Syphons for Special Purposes.—In the larger laboratory operations the most convenient syphon is made from a six-, eight-, or ten-foot length of rubber hose. This syphon, on account of its flexibility, can be used in many operations where glass or metal would be inconvenient or inadmissible, whilst its durability and simplicity of operation make it a necessity: indeed, the utility of glass syphons is greatly increased by breaking the long limb just below the bend and joining it to the other by a piece of rubber tube.

The method, already referred to, of starting a syphon by applying suction with the mouth at the long end, or filling the syphon with liquid, is not always practicable, and various other expedients are in use. The *syphon with a bulbed lateral tube* is useful where caustic liquids are to be decanted. The finger is placed over the end of the long limb, and suction applied at the small tube until the downward current is started. Negretti's syphon has a glass syringe attachment upon the lower part of the long limb to accomplish the same purpose. Fig. 232 represents a modification of Mohr's syphon, the bottom having been cut from a Farina cologne-bottle, T, by starting a cut with a three-cornered file near the bottom and extending it around the surface with a red-hot poker. The edges are now filed so that they are no longer sharp, and a cork is fitted and twice perforated

FIG. 232.

Syphon.

to admit the longer limb of the syphon, and a suction-tube, G. It is started like the syphon with a lateral tube, the moistened forefinger closing the lower aperture, V, whilst suction is being used at G until the liquid has been started. A simple glass tube, with a short piece of rubber tube attached, is in practical hands an efficient substitute for elaborate contrivances to start the flow in a syphon; even if the liquid is caustic or disagreeable, there is no risk in careful hands if the rubber tube is held between the thumb and finger so that it can be instantly pinched tightly to prevent the upward flow of the liquid into the mouth.

Colation, or Straining (*colare*, to strain), is the process of separating a solid from a fluid by pouring the mixture upon a cloth or porous substance

FIG. 233.

Pattern for strainer.

FIG. 234.

Strainer.

which will permit the fluid to pass through, but will retain the solid. This operation is frequently resorted to for separating sediment or mechanical impurities of various kinds from liquids. Gauze, fine muslin, cotton flannel, woollen felt, and other fabrics are used. Strainers are employed where the

solid particles to be removed are not in very fine powder, or where complete separation is not especially desired.

Felt Strainers are usually in the shape of felted, seamless, conical bags; the material is of wool and quite thick: they form excellent strainers for melted fats, petrolatum, wax, oils, syrups, elixirs, etc., where a large quantity of substance is to be strained. Their expensiveness is, however, an objection to their use, and the difficulty of cleaning them, owing to the tenacity with which they retain odors, unfits them for general use by the apothecary, but for special purposes in manufacturing pharmacy they are very useful.

FIG. 235.

Use of strainer.

Woollen Strainers made of twilled woollen cloth, flannel blanket material, etc., are more economical, because they can be cut to any size desired, and the material costs less, whilst if the seams are closely sewed or overseamed they will last a long time. The form known as Hippocrates's sleeve (see Fig. 234) is that generally used. Fig. 233

shows the shape and dimensions before being sewed. A wooden hoop or brass ring is required to keep the opening extended. This should

be arranged so that it can be removed when the bag is to be washed. The most convenient support is a stick passed through the cords which are attached to the strainer, the whole suspended in a barrel arranged as shown in Fig. 235. The object of suspending it in the barrel is to avoid currents of air, which, in the case of many liquids, would cause evaporation from the surface and the formation of a crust, and thus impede the rapidity of colation. A tin or copper can of proper size may be placed in the barrel to collect the strained liquid.

Cotton-Flannel or Canton-Flannel Strainers are cheaper than those of woollen, and if bleached they have the great advantage that they can be used for alkaline solutions. The unbleached cotton flannel is probably stronger, but the coloring-matter naturally present, being soluble in alkalis, is apt to discolor the liquid.

Cotton-Cloth or Muslin Strainers are generally suspended on a wooden frame, as shown in Fig. 236. The frame should be securely joined without glue, and at

FIG. 236.

Cotton-cloth strainer.

FIG. 237.

Strainer and frame.

each corner there should be a strong, pointed nail projecting slightly outward. The cotton cloth should always be soaked in boiling water before fastening it to the frame, to dissolve out the substances used by the manufacturer in calendering the goods. Fig. 237 shows the method of fastening the strainer to the frame. It should be secured at each corner, first upon the permanent nails, and then two tacks upon the side of each nail should be driven

FIG. 239.

Careless straining.

FIG. 238.

Prescription strainer.

two-thirds of their length into the frame; this partial driving of the nail is sufficient to hold the cloth and permit of the easy removal of the

tacks. A strainer hung in this way will hold more liquid and do much better work than one which is tacked all around the frame. This method of straining is particularly useful in collecting precipitates which require washing.

Colation in Smaller Operations.—When solid particles are to be separated from liquids in the operations of the dispensing counter, several methods may be used. One of the most convenient is to insert a plug of absorbent cotton in the neck of a funnel and then pass the liquid through; a funnel with a circle of brass-wire gauze soldered in it two-thirds of the way down is sometimes used, although not recommended, because of the difficulty of cleaning it. A better small strainer is made by using the hard-rubber sieve, V H (see Fig. 238). The muslin gauze, C, is easily replaced, and the sieve may be placed in a funnel. The cotton cloth used by the makers of cheese, called cheese-cloth, is admirably adapted for many kinds of straining. When coarse muslin strainers are used for the first time, they are prepared by soaking them in hot water and placing them in a funnel carefully so as to line the inside. Care should also be taken to see that the strainer is not too large, for if the wet strainer projects over the edge of the funnel, a syphon action may be set up and more of the liquid delivered outside of the bottle than inside. Fig. 239 shows the action of such a strainer.

CHAPTER XI.

FILTRATION.

Filtration is the process of separating liquids from solids with the view of obtaining the liquids in a transparent condition. The intervention of porous substances, called *filters*, to intercept the solid particles, is necessary in performing this process. These are usually made from paper, paper pulp, sand, asbestos, ground glass, charcoal, porous stone, etc. The liquid which has passed through the filter is called the *filtrate*.

Paper Filters are the most useful of all kinds for the pharmacist, and they are employed in all the finer operations requiring filtration. The solid particles are much more completely separated by filtration through good paper filters than through strainers, owing to the pores of the paper being smaller and more numerous. The paper used for this purpose is especially prepared, and is called *filtering-paper*: it is made now upon a large scale, and can be had of excellent quality. Unlike a strainer, it is never used more than once; its cost is so trifling, and it is so easily ruptured when wet, that it is not worth while to attempt to save filters for subsequent use. Filtering-paper is found in commerce in two forms,—in large, nearly square sheets, and in circular sheets. The former is used for large filters, and has some advantages, if the waste pieces can be put to use; but it is usually more convenient for the pharmacist to rely for constant use upon the circular sheets of different sizes: the difference in price between the two is now so trifling that the latter is almost always preferred. Two kinds of square-sheet filtering-paper are commonly found,—German white, a rather thin, but good paper, and heavy French, the latter very thick and porous, having a rough surface; it is the more expensive paper, but is better for special purposes. Of the round filters, the French, Swedish, German, English, and Scotch are among those best known in America. For pharmaceutical purposes the French filters are almost universally used, the “Prat Dumas” brand being the most common, the gray paper being made from a mixture of cotton, flax, wool, etc.; this paper answers sufficiently well for filtering colored liquids, fluid extracts, or tinctures, but, owing to the coloring matter it contains, it should never be used for any solution containing free alkali.

It is safer to form the habit of never using it for liquids that are intended to be colorless when filtered; of course it is entirely unfitted for analytical work. The “Prat Dumas White” is of good quality, and it or some other good quality of white paper should always be on hand

for special purposes, for filtering alkaline or alkaloidal solutions, and for the nicer operations. Very good filtering-paper of English and Scotch manufacture may occasionally be procured; that made in Sweden, however, by Munktell, is preferred for the processes of ignition and analytical work; it yields the smallest amount of ash, and is practically free from soluble salts and impurities: at least a small stock should be kept by pharmacists for especially accurate work.

Methods of Folding Filtering-Paper.—Two kinds of paper filters are used, the *plain* and the *plaited*.

1. *The Plain Filter.*—This filter is used habitually by the analytical chemist, and is preferred by the pharmacist where precipitates are to be collected, and in some other operations (see Fig. 240); it is made by exactly doubling a circular sheet of filtering-paper upon itself, and then folding this directly in the middle, so that, when opened, four equal divisions or sectors appear; the filter is used by separating one of the sectors from the other three, and placing the cone formed, into a funnel; the liquid is then poured upon the filter, and the process of separating the solid from the liquid commences. The advantages of the plain filter are, 1. Simplicity and rapidity in folding, no skill being required to make one. 2. In collecting precipitates, but one-half of the surface of

the filter (two sectors) is in contact with the moist precipitate, which is often closely adherent, and therefore but one-half of the surface has to be cleaned. In some cases there may be a disadvantage in the use of the plain filter, owing to the unequal rate of flow,—the tendency of the three folds being to attract the liquid to the side of the funnel upon which they rest, and thus the precipitate may be unequally washed. A stronger and more rapid filter may be made by placing one plain filter inside of another,

so that the three sides of the upper one shall be in contact with one side of the lower one, and *vice versa* (see Fig. 241). If the sides of the funnel have an angle of 60° , the plain filter made as described will fit the funnel properly; but it frequently happens that the angles of funnels vary, and if an ordinary plain filter is placed in a funnel not having an angle of 60° , a portion of the filter is left unsupported, and the weight of the liquid is apt to rupture the moist paper. This difficulty may be overcome by making a fresh crease in the outside fold of the plain filter; if this is made to the right of the original crease of the 60° filter, and the inside fold pushed around a corresponding distance,

FIG. 240.

Plain filter.

FIG. 241.

Double plain filter.

a filter having a smaller angle is produced, whilst if the fresh crease is made to the left of the original crease a larger-angled filter may be made. Rother's method of making a plain filter has the advantage of giving two filters from the same sheet that is usually required for one filter. To make it, the circular disk of filtering-paper is cut through in the line of its diameter, and half of the disk is folded into two equal parts; the double edge of the cut sides is turned down and folded over on itself narrowly several times (see Fig. 242), and with the blade

Fig. 242.

Rother's filter (first step).

Fig. 243.

Rother's filter.

of a spatula the fold is compressed so that it will retain its shape (see Fig. 243). This filter may be used in collecting precipitates.

The **Plaited Filter** may well be called the "pharmacist's filter," for it is the form almost exclusively used in ordinary filtering operations.

Figs. 244 to 254 show the progressive steps in the folding of a plaited filter. It is made by folding a circular sheet of filtering-paper twice, as in making a plain filter.¹ The edge BD, Fig. 247, is then laid upon ED, and the crease FD is formed; in like manner CD is laid upon ED, and HD is formed. Then DB is laid upon FD, and ID is formed, and by rolling over the fold in the same direction once more until FD is laid upon ED, the crease KD is made (see Fig. 249). Now in the same way CD is laid

Fig. 244.

Filter.

upon HD, and HD upon ED, and it will be noticed that the folded semicircle has been creased into eight equal spaces, and that the direction

¹ It will be observed that in the first folding of French filters, "Prat Dumas," the disks are not perfect circles: this causes one edge to project (see Fig. 245), and facilitates the opening of the filter.

of each crease is the same, so that if the paper is lifted it will appear as shown in Fig. 251.

The next step is to fold each one of these spaces *back on itself* (Fig. 252). BD is laid upon FD, and then BD is turned upward and back

Folding plaited filter.

until it is laid upon ID. This makes the crease QD, which is the first fold in the opposite direction. Taking both folds between the fore-fingers and thumbs of both hands, the edges BD and ID are folded upward and back upon FD, and the crease PD is formed; then these three edges, BD, ID,

Folding plaited filter.

and FD, are taken all together and folded back upon KD, and the crease OD is formed, and so on, each space in turn being folded back in the opposite direction, until the last one is reached. The folded filter is then held at the apex with the left hand upon a table or flat counter, and pressed and smoothed out with the right hand in order to emphasize the folds: it should then be placed in the funnel, whilst still *unopened*, to see whether

FIG. 247.

Folding plaited filter.

FIG. 248.

Folding plaited filter.

it needs trimming; if the rough edges of the filter project above the top of the funnel, the filter must be removed, and they must be cut off neatly with a sharp knife or a pair of scissors so that the whole of the filter may be placed inside of the funnel. Having satisfied this re-

quirement, the filter should be carefully opened out (see Fig. 254) and placed in the funnel.

Another method of folding a plaited filter is illustrated in Figs. 255 and 256. A plain filter is folded as in Fig. 240, and the quadrant, consisting of four thicknesses of paper, beginning at the left-hand side, is folded at once into narrow parallel plaits backward and forward.

Fig. 255 represents the filter after being once opened, and Fig. 256 shows the inside of the filter: it will be observed that the creases do not converge to a point as in the plaited filter (see Fig. 254), and hence the apex is less likely to be weakened.

Maxims.—1. In folding a filter, care should be observed not to extend the creases entirely to the apex, but to end them at a distance of about half an inch from it, because the point at which all the creases converge would be thereby so weakened that the

weight of the liquid would rupture the filter.

2. The filter should be moistened with water after introducing it into the

FIG. 249.

Folding plaited filter.

FIG. 250.

Folding plaited filter.

FIG. 251.

Folding plaited filter.

FIG. 252.

Folding plaited filter.

funnel and before pouring upon it the liquid to be filtered (except, of course, in the case of a liquid immiscible with water): this promotes

rapid filtration, and washes the filter besides. If hot water is available, it is usually to be preferred.

3. If the liquid to be filtered contains free acid or alkali, or if it contains a very fine precipitate, or is very dense or hot, a double filter should be used. In the case of plain filters, they should be arranged as in Fig. 241. If plaited, two sheets of paper should be taken and folded as if they were single. A filter may be also strengthened by placing a small capping filter or plain filter, a piece of well-washed linen or muslin folded

FIG. 253.

Folding plaited filter.

FIG. 254.

Plaited filter.

like a plain filter, or a plug of absorbent cotton, into the funnel before introducing the filter. The apex is always the weakest, the most exposed, and yet the most important part of the filter.

FIG. 255.

Plaited filter, parallel folds.

4. In pouring the liquid into the filter, the stream should never be delivered directly upon the apex, but upon one of the sides, so that the force of the fall will be broken before the weakest point is reached.

5. The filter should be entirely within the funnel. If the edges of the paper project above the funnel, waste from evaporation in volatile liquids, also from

the increased and unnecessary absorption due to the excess of filtering-paper, ensues, and in addition an untidy and careless habit is encouraged.

6. The end of the funnel should touch the side of the receiving vessel, so that the filtrate will trickle down its inside edge: by this expedient splashing will be avoided (see Fig. 257).

7. In filtering into a bottle, care should be observed to leave sufficient space between the neck of the funnel and the mouth of the bottle

for the escape of air, otherwise filtration will be retarded or prevented; a piece of twine placed between the two surfaces generally serves a good purpose. *The end of the funnel should project below the lowest part of the neck of the bottle* (see Fig. 258). If the diameter of the end of the funnel is too large to admit of this, or if it is only half inserted, the filtrate will be very apt to fill the intervening space and flow over the outside of the bottle, as shown by the arrows in Fig. 259.

Funnels, sometimes called *tunnels*, are conical-shaped instruments intended to facilitate the pouring of liquids into narrow-mouthed vessels, and, as they have also an important service to perform for the pharmacist in supporting filters, they will be considered in this place. Funnels are made of tinned copper, tinned iron, hard rubber, Berlin-ware, porcelain, queen's-ware, granite or agate-ware, earthen-ware, or glass. Metallic funnels have an advantage in point of durability over porcelain and glass, but a disadvantage in being acted upon chemically by liquids and in being more difficult to clean. The triangle formed by the sides of a funnel, and the line joining them, should be equilateral (see Fig. 260). The angles being each 60° , a funnel having this shape will accurately support a plain filter made in the usual way. Funnels are frequently fluted, grooved, or ribbed on the inside for the purpose of

FIG. 258.

Plaited filter, parallel folds.

FIG. 257.

Arrangement of funnel in filtration.

FIG. 258.

Filtering into a bottle (proper method).

FIG. 259.

Filtering into a bottle (improper method).

facilitating the downward flow of the filtrate (see Fig. 261), or wire frames, either fixed or folding, are arranged in a plain funnel with the same object. These aids are of doubtful utility, however, whilst the tendency of the raised ribs is to form a lodgment for foreign substances.

A well-made plaited filter in a plain funnel will perform as much work in the same time, and if the habit is once formed of always carefully and skilfully folding a filter, its importance in saving time and labor will be appreciated ever afterwards. One of the ribbed funnels in the market has an improvement in the neck, which, instead of being round, is triangular. This permits the free escape of air from the interior of a bottle, and is much superior to the indistinct groove which is often made on the outside surface of porcelain funnels.

FIG. 260.

Plain funnel.

Plain glass funnels are more generally useful to the pharmacist than any other kind. They are easily cleaned, and dirt upon them may be quickly seen. They are very useful as percolators, and the whole process of filtration or percolation may be observed without trouble. Their only disadvantage is the ease with which they are fractured. The next

FIG. 261.

Ribbed funnel.

kind in point of usefulness is the plain tinned-copper funnel. The neck should be made square or triangular, instead of round. Copper funnels are far superior to those made from tinned iron, and the difference in cost is greatly in favor of tinned copper, if true economy is considered. Hard-rubber funnels are light in weight, and are not very easily broken, for they may be often dropped upon the floor without injury. They are not acted upon by chemical substances, and with ordinary care will last a lifetime. They lack one advantage of those made from glass, however, in their absence of transparency. One or two hard-rubber funnels may be usefully employed at the dispensing counter. Porcelain, queen's-ware, or Berlin-ware funnels are, of course, not transparent; and they have the disadvantage, at least in the larger sizes, of being heavy. They are, however, not affected by liquids, but their advantages over glass are so slight (being somewhat less fragile) that they are not often employed. Earthen-ware funnels, if well glazed, are very useful in filtering *hot liquids*. Enamelled funnels, called granite- or agate-ware, etc., are made from sheet-iron having the surface entirely covered with a glazed composition which resists the action of most chemical substances. If carefully used, they answer for many purposes. Their greatest objection arises from the brittleness of the enamel, which is apt to chip off if the funnel is dropped upon the floor or subjected to a blow; and at the point where the neck of the funnel is joined to the body, the enamel coating is so thin that by constant use and knocking about it is soon chipped off, the exposed iron quickly rusts, and the neck breaks off from the body. Tinned-iron funnels are most largely used, and are popular because of their cheapness; but it is quite possible for a pharmacist to ruin in one operation a preparation

worth ten times the cost of the funnel by filtering it through a tinned-iron funnel and allowing it to come in contact with the iron exposed by the wearing off of the tinned surface.

Filters for Special Purposes.—In the course of laboratory work it frequently happens that large quantities of liquids require filtering, and the methods suitable for smaller operations cannot be profitably employed: the filtration and purification of water often become necessary. Charcoal in some form is frequently employed, not only on account of its porous character, but also because of its power of absorbing odors and depriving liquids of color. Sand, powdered glass, or asbestos forms an excellent filtering-bed. A very practical and inexpensive charcoal filter is shown in Figs. 262 and 263. It was devised by Dr. Hadden, and is illustrative of a principle in filtration not heretofore treated of in this work,—i.e., *upward filtration*. It is believed

by the advocates of upward filtration that great economy is secured by passing the cloudy liquid upward through a filtering-bed, the principle of action being that impurities settle away from the filtering medium by the force of gravity, instead of accumulating upon it and clogging the pores. Figs. 262 and 263 show an external and a dissected view of the filter. A gallon tin can has a short pipe soldered to it near the bottom; the pipe has a

piece of perforated tin or gauze soldered over the opening into the can, to keep it from being filled up. This can is filled with clean gravel. The smaller quart can is connected with the lower one by a raised perforated tin diaphragm, and small pieces of charcoal are packed upon the diaphragm; the upper perforated diaphragm is movable, and is intended to keep the charcoal in place. A disk of coarse cotton flannel should be placed on top of the charcoal, to keep the fine charcoal-dust from working through the top to the upper tin can: this is kept in place by a screw-joint and washer such as is often seen on fruit-cans. About an inch from the top of the can is a small piece of pipe for delivering the filtered water. This filter is, of course, intended to be used in cities and towns, or where water is supplied under pressure. Both the supply- and the exit-pipe should be of proper diameter to permit the use of rubber tube for connecting with the water-supply and delivering the filtered water. The filtration of oils is often effected in a similar manner, one of the

Hadden's filter.

Hadden's filter (interior).

earliest applications of this principle being the oil filter or strainer of Wm. R. Warner, of Philadelphia (see Fig. 264). This filter or strainer consists of an upper cylindrical tinned-iron vessel, A, about twenty-two

inches high and ten inches in diameter, with a flange-rim soldered on the bottom, of rather less diameter, and about an inch wide, so as to fit firmly into the open top of another cylindrical tin vessel of the same diameter and eighteen inches high. The upper vessel is furnished with a lid, and with a tube and stop-cock, *c*, which penetrates the side close to the bottom, and fits into another tube, *d*, at *e*, which tube opens into the lower vessel close to its bottom and is secured to the side of B by a strong tubular stay. The filtering medium is a cone of hat-felt projecting upward from near the bottom of the lower vessel, and secured by thumb-screws passing through two tinned-iron rings and the felt, which are all properly pierced for the purpose. The stop-cock *c* being closed, the upper vessel is fitted in its place, and the tube-joint *e* rendered tight by wrapping twice around it a strip of isinglass plaster well moistened. When this is dry, the upper vessel is filled with the crude oil, and the stop-cock *e* opened, that the oil may flow into the open space below the filter. A heat of 120° F. is preferred to facilitate filtration or colation, and the filtered oil, as it accumulates in B, should be drawn off,

as any large amount greatly retards the process by decreasing the force of the column bearing on the filter. For a pressure filter or strainer, Prof. B. S. Proctor uses a quadrangular cloth filter-bag securely tied to the end of a tin tube five feet long. The extremity of the tube has a wire ring soldered to it, to keep the bag from slipping off.

Continuous Filtration.—Most of the expedients used in continuous washing (see page 209) are applicable to continuous filtration.

Filtration of Volatile Liquids.—It is evident that the ordinary methods of filtering liquids will not be practicable for very volatile liquids, because of the loss through evaporation, and the liability to explosion, in the case of inflammable volatile liquids, if brought in contact with flame. Funnels must be covered, and provision made for the escape of the confined air in the receiving vessel. The following method is preferred to the elaborate expedients usually recommended. A glass tube (one of those usually sold as julep-tubes answers very well) is arranged in a glass or metallic funnel, so that the tube will lie close to the side of the funnel and allow one end to project above the filter, but not above the edge of the funnel: it may be held in its place by a ring of absorbent cotton gently thrust into the throat of the funnel. Or a rubber

cover perforated to admit a tube is placed on top, and connection between the bottle and funnel effected as shown in Fig. 265. For larger operations, Dr. Hadden's water-filter or Warner's oil-filter (see pages 224 and 225), slightly modified to suit the liquid, might be used. A very neat method of filtering volatile liquids is provided in the apparatus contrived by E. H. Hance, of Philadelphia. This consists of a cylindrical vessel provided with a tubulure and stop-cock below, and a ground-glass cover above; a flange near the top affords support for a perforated filter-support or funnel containing a filter. When not needed for filtration, the receiving vessel is very useful for many other purposes.

Hot Filtration.—This process is not resorted to as frequently as it might be with advantage, because of the difficulties which are asserted to attend it. These have been greatly over-estimated, for by the use of simple, properly-contrived apparatus many preparations which heretofore have been dispensed, bearing an unsightly cloudy appearance, can be greatly improved. Yellow wax is frequently full of mechanical impurities; ordinary straining will not deprive it of these, but it may be filtered through paper and thoroughly purified. Jellies, benzoinated

FIG. 265.

Filtration of volatile liquids.

FIG. 266.

Hot filtration.

lard, petrolatum, cerates, ointments, etc., may thus be filtered. One of the simplest and most easily managed forms of apparatus (see Fig. 266) is made by filing off the ring from one of the ring-supports

of a retort-stand, J, and slipping on to the arm a brass circular jet, V, attached to a tee carrying the gas-supply pipe, A. A tinned-copper or tinned-iron funnel is supported by an appropriate ring at a suitable distance above the jet.

FIG. 267.

Jacketed funnel.

The filter is placed in the funnel, a receiving vessel adjusted below, and the hot liquid poured into the filter. It is plain that the liquid can be heated to almost any degree, and the filtration conducted at a much higher temperature (if need be) than by the jacketed hot-water funnel (see Fig. 267), and, on the other hand, the heat may be regulated so that it will be very moderate. The hot-water funnel is an old device, and consists simply of a jacketed funnel having a wide tube soldered at the lowest point, and an opening in the upper edge for the water-supply.

A burner or a lamp-flame

will heat the water contained between the funnels, and a regulated heat not exceeding that of boiling water is obtained (see Fig. 267).

A modification of Dr. Hare's hot-water filter, which permits the use of glass funnels of different sizes, is shown in Fig. 268. It is simply

FIG. 268.

Hot filtration.

a tinned-copper box, with two sides shaped like a trapezoid, and supported upon four legs. There are three one-inch tubulures in the bottom, and the top has three openings which centre with the tubulures; beginning with the deepest, the diameters are four, three, and two inches. Three glass funnels of different sizes are selected, and the corks for the tubulures in the bottom, having been chosen, are perforated so as to permit the necks of the fun-

nels to pass through and form perfectly tight joints. Water is placed in the box and heated by the burner, as shown in the cut. When

not needed for hot filtration, solid corks may be used to close the tubulures, and the box used as a water-bath, covers being placed over the openings which are not in use.

Rapid Filtering Apparatus.—Of late years much attention has been expended upon methods of increasing the rapidity of filtration. Most of the plans suggested depend upon the principle of filtering into a partial vacuum, but the means used to obtain this vacuous space are very varied. A simple method, applicable to operations on the small scale, consists in fitting a good cork to a wide-mouthed bottle and perforating it so that the neck of a funnel will accurately pass through it; another perforation permits the insertion of a piece of glass tube of small diameter. A plain filter of well-washed coarse linen or muslin cloth is then carefully adjusted in the funnel, and a plain filter of paper placed upon it. The liquid is poured upon the filter, and, a rubber tube having been fitted to the glass tube, suction is applied by the mouth. By pinching the rubber tube a partial vacuum is maintained in the bottle, and filtration is hastened. An improvement upon this would be to use a rubber stopper instead of cork, and instead of pinching the rubber tube to use a screw pinch-cock.

Water-Pumps acting by a Fall of Water.—One of the first practical efforts made in the direction of using water-power was seen in Bunsen's pump. The action depends upon the principle that a column of water descending through a tube from a height is capable of sucking with it the air contained in a lateral tube, if the latter is properly arranged. A cheap home-made apparatus, which depends upon a fall of water for its usefulness, is shown in Fig. 269. It consists of a common wide-mouthed half-gallon jar, and a tinned-iron can holding three, four, or five gallons; a castor-oil can answers very well. The screw-cap is for readily filling the can; the exhaust-pipe on the right reaches inside of the can, nearly to the bottom, the other tube is soldered on the head of the can connecting with the interior. The jar, having a funnel fitting into it through an air-tight stopper, is connected with the can by means of a bent glass tube and rubber tube. The can is filled with water, and the solution to be filtered is placed in the funnel. The exhaust-pipe is connected

FIG. 269.

Rapid filtration.

FIG. 270.

Lux's aspirator.

FIG. 271.

Rapid filtration.

with a rubber tube eight or ten feet long and a quarter of an inch in diameter (the longer the tube the more rapid is the filtration). When the

siphon thus formed is started, the flow of the water from the can carries with it the air from the bottle. (N. R., 1881, p. 266.)

Lux's aspirator (see Fig. 270) is constructed by fitting two accurately-perforated rubber stoppers to the ends of a piece of wide glass tubing; four short glass tubes are inserted in the stoppers, as shown in the cut. One of the tubes is for the supply of water, another carries it off, the third tube is connected with the vessel to be exhausted, whilst the fourth tube may be put to the same use, or connected with a vacuum gauge or closed with a stopper. If the air is to be aspirated by one of the lower tubes, the vessel to be exhausted must stand on a higher level than the aspirator. The length of the exit-tube determines the power of the aspirator. It should have a bore of one-fifth of an inch and be at least ten feet long, and it should be provided with a screw pinch-cock to regulate the flow of water. A very simple apparatus is shown in Fig. 271. A very moderate fall of water is needed here. It is, however, adapted only to small operations. Two rather large bottles, of equal capacity, and both provided with nipples near the bottom, are selected. Into the neck of each is fitted a tight-fitting stopper carrying a glass tube bent at a right angle, and the nipples near the bottom are connected with a rubber tube. A Woulffe's bottle having two necks is next selected, and one of the necks fitted with a tight-fitting stopper carrying a small bent tube, to which is attached a rubber tube provided with a conveniently situated pinch-cock. The other end of the bottle is provided with a stopper so perforated that it will receive air-tight a glass funnel. One of the large

FIG. 272.

Fisher's vacuum-pump.

FIG. 273.

Vacuum-pump.

bottles is filled with water and placed on an elevated shelf, when the water will flow down to the other bottle: and if the connections are made as shown in the cut, it will aspirate through the funnel; and if the funnel is full of liquid, it will cause the latter to run through quite rapidly. When

the lower bottle is full, it is substituted for the upper one, and the connection with the vessel to be exhausted, transferred to it.

Water-Pumps acting by Pressure.—It is usually inconvenient to operate aspirators which depend upon a fall of water through a long tube, except in high buildings: hence water-pumps which are operated by pressure are generally preferred in cities and towns, or in localities where water is supplied under pressure. The following are selected

from the great variety in use as being good illustrations of the principle. Those made of glass are not recommended, because of their extreme liability to breakage. Fisher's vacuum-pump is well shown in Fig. 272. A, B, C, are intended to receive rubber tubing, and the neck, D, may be fastened by a clamp to a retort-stand or other upright fixture. Water from the hydrant enters at A, passes through the nipple at *a*, and, being forced through the contracted portion, *b*, draws with it the air from the tube, B, which is attached to the filter. A communication is also made with the vacuum-gauge, as shown in the cut, to mark the degree of exhaustion. Schütté and Goehring, of Philadelphia, have contrived a similar apparatus, which is somewhat more convenient from their having placed it upon a base and deflected the lower tube laterally. This permits the use of the apparatus in many places where Fisher's pump could not be used. It is shown in Fig. 273. W represents the water-supply tube, D the outlet, and A the aspirating tube.

QUESTIONS ON CHAPTER XI.

FILTRATION.

- What is filtration ?
- Of what are filters usually made ?
- What is the liquid that passes through a filter called ?
- What kind of filters are most useful and most employed ?
- What objection is there to the ordinary gray filtering-paper that is commonly used ?
- What is the difference between a plain and a plaited filter ?
- How is a plain filter folded ?
- What is its special advantage ?
- What is a disadvantage of a plain filter, and how may it be obviated ?
- What is Rother's method of making a plain filter ?
- What advantage has this ?
- How is a plaited filter ordinarily made ?
- How can a plaited filter be folded differently, so as to strengthen its apex ?
- In folding a filter should the creases extend entirely to the apex ? Why ?
- What exceptions are there to this plan ?
- In what cases should a double filter be used ?
- How may a paper filter be strengthened ?
- Should a filter extend beyond the edges of the funnel ? Why ?
- What are funnels used for ?
- What materials are they made of ?
- What angle should a funnel have ?
- What kind of funnels is most generally useful ?
- What is the advantage of tinned copper for funnels ? Of hard rubber ? Of porcelain ?
- For what purpose are earthen-ware funnels useful ?
- What is an objection to enamelled (called granite- or agate-ware) funnels ?
- What is an objection to tin funnels ?
- How is upward filtration performed ?
- Describe William R. Warner's oil-filter.
- How may volatile liquids be filtered ?
- How may hot filtration be accomplished ?
- What is a jacketed funnel ?
- Describe Dr. Hare's hot-water filter.
- How may the rapidity of filtration be increased ?
- How may a fall of water be made to increase the rapidity of filtration ?
- Describe Lux's aspirator.
- Describe Fisher's vacuum pump.

CHAPTER XII.

CLARIFICATION AND DECOLORATION.

Clarification is the process of separating from liquids, without the use of filters or strainers, solid substances which interfere with their transparency. The processes of clarification and decoloration from a pharmaceutical point of view have declined in importance of late years, owing to the fact that chemical and other substances requiring the processes are supplied in a purified condition so cheaply that it is absolutely impossible for the pharmacist to compete with the manufacturer who operates on the large scale and uses apparatus and methods which are thorough and economical. This is particularly the case with sugar and the alkaloids. Formerly the apothecary bought raw sugar and clarified the syrup; now the difference in price between raw sugar and that which is pure is so slight that no one ever makes syrup from raw sugar. The decoloration of alkaloidal solutions and the manufacture of alkaloids cannot be economically attempted on the small scale by the pharmacist, because of the want of continuity of the process; the manufacturer, on the other hand, can use the animal charcoal repeatedly until its power is exhausted, and in other ways practise economy not possible to the apothecary. It is, nevertheless, very important for the student to comprehend thoroughly the principles underlying both processes.

Clarification may be effected in several ways:

1. By the application of heat.
2. By increasing the fluidity of the liquid.
3. Through the use of albumen.
4. Through the use of gelatin.
5. Through the use of milk.
6. Through the use of paper pulp.
7. By fermentation.
8. By subsidence through long standing.

1. *By the Application of Heat.*—When a viscid liquid is heated, its specific gravity is diminished, and frequently particles which were suspended in it, and interfered with the transparency of the liquid, will separate, the heavier ones falling to the bottom, and the lighter ones rising; in the latter case, ebullition facilitates the separation, the minute bubbles of steam becoming enveloped in the viscid particles rise through their buoyancy, and a scum is formed which may be readily separated. The official process for the clarification of honey (*Mel Despumatum*) is a good illustration of the use of heat in this connection.

2. *By Increasing the Fluidity of the Liquid.*—Clarification by this method depends upon decreasing the specific gravity of the liquid by the addition of water, alcohol, or other liquid lighter specifically than

the one to which it is added : this causes the suspended particles to subside, and the clear liquid may then be decanted.

3. *The Use of Albumen.*—The property possessed by albumen of remaining liquid at ordinary temperatures and becoming coagulated by heat renders it one of the most useful substances that can be employed in the process of clarification. Its action is mechanical, and where albumen exists naturally in the liquid, as in many fruit and vegetable juices, the simple heating of the liquid suffices to coagulate the albumen, which envelops the particles that render the liquid cloudy, and these rise to the top and are skimmed off. Albumen, or white of egg, is frequently added to liquids to clarify them ; in such cases it should always be added before the liquid is heated : this is best accomplished by adding about an equal bulk of the liquid to the albumen, then introducing the mixture into a muslin strainer and squeezing it through the meshes of the cloth by gathering up the corners and spirally twisting the strainer, when the organization of the albumen is destroyed, and a smooth mixture results ; the strained solution is then added to the liquid to be clarified, and the whole heated gradually (usually until it boils), without stirring, until coagulation is effected. In most cases the white of one egg is sufficient for a gallon of liquid : the error most frequently made by operators is the use of an excess of albumen. Care must be taken not to use albumen as a clarifying agent in those cases where the active principle of a liquid forms a precipitate with albumen by combining with it.

4. *The Use of Gelatin.*—Gelatin is used when tannin is present and is the cause of cloudiness, or when it is desirable for other reasons to remove it : its action depends upon the fact that gelatin forms with tannin an insoluble compound ; this is, indeed, the basis of leather. Isinglass, one of the purest kinds of gelatin, is the preferred form ; it is frequently employed for clarifying infusions containing tannin, such as tea and coffee, etc. It is used by adding a weak solution of the gelatin in hot water to the liquid before it is heated, and allowing the liquid to cool. The insoluble compound formed must always be strained or filtered out.

5. *The Use of Milk.*—The presence of casein in milk, and the fact that acids precipitate it in the form of a curdy precipitate, are taken advantage of in the use of milk as a clarifying agent. It is employed particularly for vinous preparations, sour wines, etc., and should not be used in excess.

6. *The Use of Paper Pulp* does not depend upon chemical combination, its action being purely mechanical. Paper pulp for filtering is best prepared by placing filtering-paper (the saved trimmings and scraps left from making filters answer well) into a mortar or other vessel, and pouring enough solution of soda or potassa on it to soak it, then stirring it with the pestle until it is reduced to a pulp. This should then be washed by placing a loose plug of absorbent cotton in a funnel and pouring in the mixture : when it has drained, water (preferably hot) should be poured upon it until all traces of alkalinity are washed out ; the purified pulp may then be placed in wide-mouthed bottles until needed. It is used as a clarifying agent by adding a portion to the

cloudy liquid, agitating the mixture, and allowing the whole to stand quietly until the liquid is clear; or, as a filtering agent, after the addition of the pulp, the mixture may be thrown upon a wetted muslin strainer, and if the liquid which passes through at first is not clear, it may be returned until it is. It will be found that the particles of pulp will partially fill up the meshes of the strainer, and an excellent filtering-bed is thus formed: care should be taken, therefore, not to stir the mixture up after it is placed on the strainer.

7. *By Fermentation*.—The changes in the composition of juices after they have been fermented usually lead to the deposition of those substances which previously interfered with the transparency of the juices; the generation of alcohol through fermentation produces a liquid in which the substances are insoluble, hence the formation of a deposit. The official preparation of syrup of raspberry affords a good illustration of the principle of clarifying juices by fermentation, whilst in the manufacture of wines the principle has been known and practised for centuries.

8. *By Subsidence through long standing*.—This method involves the least possible amount of labor and expense, and it is resorted to very frequently (particularly upon the large scale) when haste is unnecessary, and whenever the liquid keeps well enough to withstand the tendency to spoil during the time necessary to effect complete separation. The deposit formed is called a *sediment*: this term is not synonymous with *precipitate*. *Sediment is solid matter separated merely by the action of gravity from a liquid in which it has been suspended. A precipitate, on the other hand, is solid matter separated from a solution by heat, light, or chemical action.* The fixed oils are clarified by subsidence; in the vegetable oils the sediment consists principally of albuminous and gummy substances which have been separated with the oil during the process of expression.

Decoloration is the process of depriving liquids or solids in solution of color by the use of animal charcoal. Decoloration is used in the abstraction of coloring-matter from fatty bodies, oils, petrolatum, syrups, honey, etc. Animal charcoal, or bone-black, which is produced by heating bones in close vessels out of contact with air, and then grinding them, is generally preferred in decolorizing operations. Wood charcoal possesses but little power in this direction. It has been generally settled that the decolorizing property is owing to the formation of insoluble compounds of the coloring-matter when it is brought in contact with porous charcoal. Animal charcoal varies greatly in its power. The official purified animal charcoal is often not so powerful as a decolorizer as the animal charcoal from which it was made; but bones contain calcium phosphate and calcium carbonate, and the object of the purifying process is to abstract these salts, because, in many of the delicate operations of pharmacy, particularly the decoloration of vegetable acid solutions, these salts would be dissolved by the acids, and the solutions thus contaminated. The most powerful animal charcoal is produced by calcining dried blood and other animal matter with pearl-ash, and afterwards washing out the pearl-ash with water, and subsequently with an acid solution: the charcoal need not be dried before using. For other

information about the properties of charcoal, see *Carbo Animalis* and *Carbo Animalis Purificatus*, U. S. Dispensatory, 17th edition, pp. 322, 323. For most decolorizing operations of the pharmacist on the small scale, the solutions, melted fats, oils, etc., can be introduced directly upon the animal charcoal, which is placed in a funnel and prevented from falling through by the insertion of a plug of absorbent cotton, or it may be arranged in an ordinary percolator, and the cold liquid percolated through the charcoal, or the liquid simply agitated with the charcoal and the mixture filtered. It is very important to remember that charcoal absorbs a number of valuable principles used in medicine, —e.g., *bitter substances*, like gentiopicrin, aloin; *astringents*, like tannin; *alkaloids*, like quinine, morphine, strychnine, cocaine, etc. Charcoal has even been used as an antidote for poisoning with the alkaloids. It should always be used with discrimination and judgment, or it may be found that in striving to improve the appearance of a preparation by lessening the color its value has been sacrificed.

QUESTIONS ON CHAPTER XII.

CLARIFICATION AND DECOLORATION.

- What is clarification?
- In what various ways may it be effected?
- How is it effected by the application of heat?
- How is it effected by increasing the fluidity of the liquid?
- How does albumen act in clarifying liquids?
- When is gelatin useful in clarifying liquids?
- How does milk act in clarifying liquids?
- What is the action of paper pulp in clarifying liquids?
- How does fermentation act in clarifying liquids?
- What is the difference between a sediment and a precipitate?
- What is decoloration, and for what articles is it used?
- What substance is generally preferred in decolorizing operations?
- How is the most powerful animal charcoal produced?
- What valuable principles used in medicine does charcoal absorb?
- For what class of substances has charcoal been used as an antidote?

CHAPTER XIII.

SEPARATION OF IMMISCIBLE LIQUIDS.

THE separation of liquids which are mutually soluble is usually effected by distillation, if one or both of the liquids are volatile (see page 148); but the separation of liquids which do not mix with each other is generally a simpler process, and the object of this chapter is to show the methods at present in use.

Use of the Pipette.—This simple instrument consists of a narrow tube with its lower end drawn out to a capillary orifice, and a bulb, either globular or elongated, blown in it near the top; the upper edge is usually surrounded by a smooth glass ring to strengthen it. It is used by dipping the lower orifice into the liquid that is to be separated and applying suction with the mouth at the upper end; the liquid rises, fills the bulb, and, if the end of the moistened forefinger is applied to the top, the liquid may be carried some distance without running out. Fig. 274 shows the ordinary form of the instrument. Fig. 275 can be readily made from a glass syringe-tube, a perforated cork, and a piece of tube, by one unskilled in glass-blowing. Fig. 276 shows a pipette which has a piece of sheet-rubber tied over the thistle-shaped top. If pressure is ap-

separating funnel.

Mitchell's separator.

plied to the rubber, the air is partially exhausted and a slight vacuum produced; if the point of the pipette is then applied to the liquid and the pressure relaxed, the liquid will rise, and it may be transferred to another vessel. A modification of this, where a rubber bulb is attached to the pipette and used in a similar manner, is seen in Fig. 40.

Use of the Glass Syringe.—The glass ear-syringe, having a bulb

blown near the orifice, is very useful in collecting a small quantity of oil floating on top of a liquid contained in a beaker or open vessel. The piston of the syringe should be well soaked in warm water before attempting this simple but delicate operation.

Use of the Separating Funnel.—This instrument, as indicated by its name, is used to facilitate the separation of immiscible liquids. It is generally a funnel having a glass stop-cock in its neck (see Fig. 277). The mixed liquid is poured into the funnel, which is placed in position where it can come to rest, and the lower liquid is then allowed to run off by opening the stop-cock. With careful use, liquids can be separated with great accuracy in this way. Where the liquid is valuable or very volatile, as in some of the oils, the globe separator (see Fig. 278), which can be accurately closed and evaporation prevented, is preferred.

Mitchell's Separator.—Dr. Mitchell devised a cheap but efficient substitute for the separating funnel (see Fig. 279). A good cork, C, is fitted into the throat of a funnel, E, and the end of a penholder-handle, H, or other suitable wooden rod, is whittled to a flat wedge, and this forced into the cork tightly. The lower portion of the holder is notched, and the upper part of the cork is tied securely to it, or a pin may be driven through it and the cork to fasten it: it is used by forcing the cork C into the neck of the funnel, pouring in the liquids, and, when they have separated, lifting the handle H carefully until the lower liquid has entirely escaped, and then pushing it down tightly to stop the flow.

Florentine Receiver.—The separation of volatile oils from the water which usually accompanies them during distillation is a very important part of their process of manufacture. Where the volatile oil is lighter than water, the form shown in Fig. 280 is used. The mixed oil and water collect in the glass receiver during distillation, the oil floating on the top, whilst the water ascends the bent tube from the bottom; further addition of distillate causes an overflow, and the water from the bottom of the receiver is discharged through the tube into a suitable vessel; then the receiver becomes filled again gradually as distillation progresses. The process of separation is continued automatically. Where the oil is heavier than water, the method is reversed, and provision must be made for the escape of the water near the top of the receiving vessel. Labor may be saved by the use of a long-necked funnel, or by placing a funnel in a wide tube, so that the mixed oil and water may be conveyed at once to the bottom without the liability of some particles of oil being carried over through the lateral tube and necessitating a second separation.

Fig. 281 shows a receiver which can be used for either light or heavy oils, one or the other tube being stopped with a cork, as the case requires.

FIG. 280.

Florentine receiver.

FIG. 281.

Receiver for heavy and light oils.

CHAPTER XIV.

PRECIPITATION.

PRECIPITATION is the process of separating solid particles from a solution by the action of heat, light, or chemical substances. The separated solid is termed a *precipitate*; the added liquid or substance which produces the precipitate, the *precipitant*; the liquid which remains in the vessel above the precipitate, the *supernatant liquid*.

The precipitate usually falls to the bottom of the vessel. It may, however, remain suspended or rise to the top.

The objects of precipitation in pharmacy are,—

1. To obtain conveniently solid substances in the form of fine powder.

Example, the precipitation of calcium carbonate.

2. To effect the purification of solids. **Example,** the precipitation of pepsin from its solution by sodium chloride.

3. To obtain through chemical reaction substances which are insoluble in the supernatant liquid. **Example,** the official preparation of red mercuric iodide.

Precipitation is largely used in testing, as it frequently affords the most ready means of recognizing chemical substances or of ascertaining their purity. A great many pharmacopœial tests are based upon this process. The color, quantity, and character of the precipitate are all taken into account. The terms *curdy*, *granular*, *flocculent*, *gelatinous*, *crystalline*, *bulky*, and others, which are sufficiently distinctive, are used to define the peculiar form which the precipitate assumes when thrown out of solution. A *magma* is a thick, tenacious precipitate left after the liquid is decanted.

Methods of Effecting Precipitation.—Precipitation may be produced in many ways. If solutions containing albuminous matter be *heated*, a flocculent precipitate of coagulated albumen will be thrown down; whilst if solution of the silver salts be exposed to the *light*, precipitation is apt to take place. Precipitation will usually occur when a hot saturated solution of an amorphous substance is allowed to cool, as in the preparation of antimony oxysulphide, or when to a solution is added a liquid in which the dissolved substance is insoluble, as when strong alcohol is added to a small quantity of mucilage of acacia, or water to an alcoholic solution of resin.

Precipitation is most generally effected by the reaction of chemical substances, and some of the most interesting processes in pharmacy are the results of this method of producing precipitates. When acid solutions are brought in contact with alkaline solutions, insoluble precipitates are sometimes formed, as the solution of oxalic acid with lime water, form-

ing calcium oxalate. By far the most common method is to mix a solution of one salt with a solution of another, thereby producing an insoluble precipitate, as in the official process for preparing mercuric iodide, where solution of mercuric chloride is added to solution of potassium iodide. The methods of producing precipitates are numerous, and will be noted in detail under the head of the respective substances.

Vessels used in Precipitation.—Precipitating vessels should be deep, comparatively narrow, and broader at the bottom than at the top (see Fig. 282). This construction permits the precipitate to occupy less height in the vessel, by causing it to spread out upon the bottom; thus the supernatant liquid can be more thoroughly decanted off, the particles of the precipitate will lie in closer contact, and a better opportunity is given for the escape of imprisoned air or gas, which frequently exercises a buoyant effect on the particles and prevents their subsiding rapidly and closely. Upon the large scale, cedar tanks, of the shape just described, may be used: these may have wooden spigots introduced, a foot or so apart, so that the supernatant liquid may be conveniently run off.

FIG. 282.

Manner of conducting the Process.—If two solutions are used, and it is known that they contain the exact quantity of solid substance to react mutually without leaving an excess of one or the other, the order in which the liquids are mixed is immaterial; but when this is not the case, and the precipitant is to be added until precipitation ceases, it is necessary to proceed with caution. The precipitant is then added gradually, and, where acid or alkaline solutions are used, litmus-paper is useful in indicating the approach of an excess. In other cases the precipitate may be allowed to subside, and the precipitant slowly dropped into the clear liquid above until it is noticed that further addition is without effect. If the precipitate is too bulky to subside quickly, the whole may be vigorously stirred until thoroughly mixed, a small portion transferred to a small plain filter, and the filtrate tested by a further addition of precipitant. If this small portion is weighed, or measured, or is a known proportion of the whole, a simple multiplication will determine about the quantity necessary to complete the precipitation. Ammonia water is one of the most useful of alkaline precipitants, because an excess is at once noticed by the odor. This is easily done by blowing the air from the surface of the liquid, thoroughly stirring up the mixture, and then noting whether it smells of ammonia.

FIG. 283.

Plain filter.

The Production of Heavy and Light Precipitates.—Hot, dense solutions usually produce heavy precipitates, and such precipitates are more readily washed from adherent contaminating salts than those which are light and bulky. An additional advantage is, that they oc-

cupy less space, and consequently their dose is less bulky. A good example of this is found in the manufacture and use of heavy and light magnesium carbonate.

Collecting and Washing Precipitates.—In small operations precipitates are collected upon plain filters (see Fig. 283): the special advantages of such filters in this respect have been already pointed out on page 208. On a larger scale muslin strainers are generally used. These are suspended on frames, as shown in Figs. 284 and 285. In washing precipitates which

FIG. 284.

Collecting a precipitate.

FIG. 285.

Frame and strainer for precipitates.

are placed on strainers of this kind, care must be observed to close up the fissures which usually appear in the magma after it has been allowed to stand a short time, by stirring the precipitate thoroughly before adding more water. (See *Lotion*, *Decantation*, pages 208, 210.)

QUESTIONS ON CHAPTERS XIII. AND XIV.

SEPARATION OF IMMISCIBLE LIQUIDS AND PRECIPITATION.

What is a pipette, and how is it used?

What is a separating funnel, and how is it used?

Describe Dr. Mitchell's separator.

What is a Florentine receiver?

What is precipitation?

What is the separated solid termed?

What is the substance which produces the precipitate termed?

What is the liquid which remains in the vessel above the precipitate called?

What are the objects of precipitation in pharmacy?

Give examples of each of these objects.

How and why is precipitation used in testing?

What is meant by the term "magma"?

What various methods are there of effecting precipitation?

What is the best shape for precipitating vessels?

If two solutions are used to produce a precipitate, in what order should they be mixed?

If an acid and an alkaline solution are mixed, how may it be determined when the mixture is neutral, or nearly so?

Why is ammonia the most useful of alkaline precipitates?

How are heavy precipitates formed?

Are they more or less easily washed from adherent salts than light precipitates?

What advantage have heavy precipitates over light ones?

CHAPTER XV.

CRYSTALLIZATION.

CRYSTALLIZATION is the process whereby substances are caused to assume certain determinate forms called *crystals*. These are distinctive, and when perfect are bounded by geometrical surfaces. Those substances which are *not* crystallizable are termed *amorphous*. The objects of the process are to increase the purity and to enhance the beauty of chemical substances. The descriptions of the crystalline forms assumed by bodies form the basis of the interesting science of *crystallography*. In a work of this kind it is impossible to give more than a very brief sketch of the outlines of the classification, since the practical process of crystallization must receive the most attention. (See Dana's *Mineralogy*, Kopp's *Krystallographie*, Miller's *Mineralogy*, etc.) Every crystallizable body invariably assumes its own characteristic form, or some form directly derived from it or related to it by a simple law, and in order to classify them crystallographers recognize at the present time six systems, to one or other of which every crystal is referred. A seventh system is sometimes conceded, but the occurrence of crystals belonging to it has not been demonstrated with certainty.

The following definitions should be well understood: The plane surfaces bounding a crystal are termed *faces*; when two contiguous faces intersect, an *edge* is formed; an *angle* is formed when three or more faces intersect.

The faces, edges, or angles of a perfect crystal have equal faces, edges, or angles opposite to them, and if the middle point of the opposite faces or edges, or the opposite angles, be joined by straight lines, the point at which these lines intersect will be the centre of the crystal. The lines drawn through this point are called *axes*.

When *the same* body crystallizes in two or more forms belonging to different systems, it is said to be *dimorphous*, *trimorphous*, *polymorphous*, etc. When *different* substances crystallize in the same form, they are said to be *isomorphous*.

Prismatic (or prism-like) *crystals* are those which are extended principally in the direction of their longest axis. *Tabular crystals* are those crystallizing in flat plates; *laminar*, those crystallizing in thin plates; *acicular*, those which are needle-shaped, etc.

Other terms are used to describe the physical characters of crystals, which are readily understood and are not technical in their meaning.

The systems of classification are based upon the length and relative position of the axes of the crystal. Those in which the three axes intersect at right angles are termed *orthometric*; and when the angles caused by their intersection are oblique, they are called *clinometric*.

SYSTEMS IN CRYSTALLOGRAPHY.

I. Monometric, or Regular System.—The crystals have three axes of *equal* length intersecting at right angles (see Figs. 286, 287, and 288).

FIG. 286.

Cube.

FIG. 287.

Octahedron.

FIG. 288.

Rhombic dodecahedron.

II. Dimetric, or Quadratic System.—The crystals have three axes,

FIG. 289.

Right square prism.

FIG. 290.

Dimetric octahedron.

two of which are *equal*, the other *different* in length, all intersecting at right angles (see Figs. 289 and 290).

III. Trimetric, or Rhombic System.—The crystals have three axes

FIG. 291.

Rhombic pyramid.

FIG. 292.

Prismatic pyramid.

of *unequal* length, all intersecting at right angles (see Figs. 291 and 292).

IV. Hexagonal, or Rhombohedric System.—The crystals have four axes, three of *equal* length, in the same plane, and inclined to one another at angles of 60° . The fourth axis is *different* in length, and intersects the plane of the other three at right angles (see Figs. 293 and 294).

FIG. 293.

Hexagonal prism.

FIG. 294.

Double hexagonal pyramid.

V. Monoclinic, or Oblique-Prismatic System.—The crystals have three axes of *unequal* length, two of which are obliquely inclined to

FIG. 295.

Monoclinic prism.

FIG. 296.

Monoclinic octahedron.

each other, the other axis forming right angles with these two (see Figs. 295 and 296).

VI. Triclinic, or Doubly-Oblique Prismatic System.—The crystals

FIG. 297.

Doubly-oblique prism.

FIG. 298.

Doubly-oblique octahedron.

have three axes of *unequal* length, all obliquely inclined to one another (see Figs. 297 and 298).

The *Diclinic System*, if recognized, would have three axes, two at right angles to each other, the third oblique to the other two.

Determination of Crystalline Form.—The method of determining the position of a crystal in one or other of the systems above noted is to measure the inclination of the angles which the faces of the crystal make with one another. From the data obtained the length and inclination of the axes are calculated. The hand goniometer or Wollaston's reflecting goniometer is used to measure the angles.

Cleavage.—If a crystal of potassium ferrocyanide or a piece of mica is broken and examined, it will be noticed that the cohesion of the particles is less in one direction than in any other, and if the blade of a knife is inserted in the edge, the crystal may be easily split or cleft. Other crystals possess this property, but to a greatly varying extent. Perfect crystals may sometimes be formed by cleavage.

The Process of Crystallization generally takes place when a body passes from a liquid or a gaseous condition into the solid state: a few instances are known where amorphous solids become crystalline without becoming liquefied, as in iron or brass wire, sulphur, barley-sugar.

Methods of Obtaining Crystals.—1. By fusion and partial cooling. 2. By sublimation. 3. By deposition from supersaturated solutions as they cool. 4. By deposition from solutions during evaporation. 5. By deposition from solutions upon passing through them a galvanic current. 6. By precipitation. 7. By the addition of a substance having a strong affinity for water.

1. **By Fusion and Partial Cooling.**—Substances which have low melting-points, like sulphur, camphor, and iodine, and some of the metals, like bismuth, antimony, etc., may be crystallized in this way. To obtain crystals of a substance like sulphur, it should be melted in a deep vessel and then allowed to cool, so that a crust will be formed; a hole is then made in the crust, and a smaller one on the opposite side; the vessel is now inclined towards the side having the larger hole, and the melted substance runs off; when the surfaces inside are examined, they will be found studded with crystals. If the quantity of material used is large, and the mass has been gradually cooled, the crystals will be large and distinct. The crust should be perforated as soon as it is fairly formed, and the fluid contents quickly removed.

2. **By Sublimation.**—This is one of the most useful methods of obtaining crystals (see Sublimation, page 171).

3. **By Deposition from Supersaturated Solutions.**—This is the method by far most frequently employed to obtain crystals. The solution of the substance is generally effected by the use of heat (see Solution): it should be carefully filtered, and evaporated to the proper degree, and this latter part of the operation is the most important in determining the size and beauty of the crystals. As a rule, concentrated solutions produce small, ill-defined crystals, whilst comparatively dilute solutions, provided they are supersaturated, produce crystals of more perfect form. The proper degree of concentration must always depend upon the solubility of the substance: if very soluble, the solution should not be saturated at the boiling temperature, or the crystals will be very small and so thoroughly interlaced that it will be difficult to wash them; if a por-

tion of the evaporating solution is transferred to a glass or porcelain plate and allowed to cool, the rapidity with which the small quantity of solution crystallizes, and the amount of crystals obtained, form a basis for judgment. Upon the large scale, in order to secure a uniform product, it will be found that the specific gravity of the solution at a definite temperature, the temperature of the air, and the quantity of the solution must be considered: these points, however, can be obtained only by experience, and after a practical trial with each substance. It is a good habit to keep a record at each operation of the specific gravity and temperature of the solution which is set aside to crystallize, and note the character of the product. If the substance is not very soluble, the solution should be evaporated until a *pellicle* or crust is formed upon the top, and then set aside.

Perfect Rest for a solution designed for crystallization must be secured, if well-defined crystals are wanted, and the solution must not be cooled quickly. When small crystals are desired, as in the case of magnesium and zinc sulphate, the solution should be cooled quickly, with constant agitation: this produces a great many nuclei, and prevents the gradual deposition of the particles in regular order upon one nucleus, which is so essential to the formation of the perfect crystal. There are several plans to choose from, for preventing rapid cooling: if the liquid is placed in an evaporating dish, and heated in a sand-bath or water-bath until evaporated to the proper point, the whole may be set away without disturbing them, to cool slowly together; or the dish may be placed in a warm room which is slowly cooled; or it may be embedded in a blanket or in woollen cloths, covered, and set aside. Having arranged the dish, it must be left absolutely undisturbed until all the crystals have separated: if jarred or knocked after the crust has once formed, the crystals will be mere confused masses.

Use of Nuclei.—It has long been known that if a smooth glass rod having a single scratch upon it be placed in a solution ready to crystallize, crystals will first attach themselves to the scratched part, and the smooth part of the rod will frequently not have any separate crystals upon it. Rough surfaces, by offering more points of adhesion, attract the nuclei upon which the crystalline body is subsequently deposited: it is for this reason that strips of wood or lead are frequently suspended in liquids intended for crystallization, whilst in the manufacture of rock-candy, threads are usually strung across the crystallizing-tubs at regular intervals, columnar masses of fine crystals being thus produced. Perfect geometrical crystals may be obtained by the practice of "nursing," which consists in selecting from the ordinary stock as perfect a crystal as can be found for the nucleus, and then suspending it by a horse-hair or piece of sewing-silk in a warm saturated solution of the salt. Prof. J. U. Lloyd contributed to *New Remedies*, in 1879, pp. 98, 133, 162, some interesting notes on the production of perfect crystals.

Retarded Crystallization.—Warm saturated solutions of various salts, particularly if contained in chemically clean vessels, protected from the dust, and left at absolute rest until cooled, usually fail to crystallize. If the receptacle is shaken or jarred, or if a crystal from which the solution has been made, or any other solid substance, is dropped into it, crystal-

lization sometimes takes place in an instant, and considerable heat is evolved: this is particularly noticed with salts capable of crystallizing with more than one molecule of water, as sodium sulphate, sodium carbonate, etc.

4. By Deposition from Solutions during Evaporation.—This process is not so frequently resorted to as that of cooling from hot saturated solutions, but it is especially useful where the liquid is more volatile than water, as alcohol, ether, benzin, chloroform, and upon the small scale for experimental purposes, or in the processes of original investigation. There are some instances in manufacturing pharmacy where the method is used, but in the case of volatile liquids the expense attending their loss, if spontaneously evaporated, is great, and, as a usual thing, rapid evaporation or recovery of the solvent by distillation cannot be used where large and distinct crystals are desired. Beautiful crystals are often made from aqueous solutions of substances that are allowed to evaporate slowly in a warm room for several months. The quantity of liquid and the amount of solid in solution have a great influence in enhancing the beauty of the product: for this reason it is usually impossible for the pharmacist operating on the small scale to vie with the manufacturer in producing massive crystals; there is compensation, however, to the pharmacist in obtaining increased knowledge of the properties of medicinal chemicals and absolute knowledge of their purity.

5. By Deposition from Solutions upon passing Feeble Electrical Currents through them.—This method is mentioned in this connection because Becquerel and others have produced crystals of metals and metallic oxides by the slow but continuous action of feeble electrical currents through the solutions, kept up for months, sometimes for years. Gold and copper may be beautifully crystallized in this way.

6. By Precipitation.—Crystals are produced in some cases by the precipitation resulting from the mixture of certain solutions, and in other ways. (See Precipitation.) The crystals formed by this method are granular, and, on account of their rapid growth, are not well defined. A crystalline precipitate of acid potassium tartrate is produced when solution of potassa is added to a strong solution of tartaric acid.

7. By the Addition of a Substance having a Strong Affinity for the Liquids of the Solution.—This method of effecting the crystallization of a solid is resorted to in some special cases. If calcium chloride is added to an aqueous solution of sodium chloride, the latter crystallizes out. Alcohol mixed with a solution of potassium nitrate causes the crystallization of the salt, because alcohol and water unite, and the potassium nitrate is not soluble in the mixture. The crystallization of sugar is frequently observed in syrups to which alcohol in the form of a tincture or fluid extract has been added, and this is often a source of annoyance to the pharmacist.

Water of Crystallization.—Many substances in the act of crystallizing combine with water, and the water so combined is termed *water of crystallization*. The same substance does not always contain the same number of molecules of water of crystallization. Sodium carbonate, for instance, usually contains ten molecules. At higher tempera-

tures it may be made to crystallize with eight or with but five molecules, and under some circumstances it contains but one molecule of water. This combination with water must be carefully distinguished from the mechanical retention of water in the interstices of crystals, which takes place particularly where the crystals are large and have been formed rapidly. Water retained in this way is termed *interstitial water*, or *water of decrepitation*, because it is the cause of the *decrepitation* of bodies when exposed to heat: the sudden expansion of the water causes the substance to crackle and burst into fragments. Crystals containing combined water lose part of it on exposure to the atmosphere, and the transparency noticed when the crystal was fresh is replaced by opacity and the formation of a dry powder on the surface. This change is termed *efflorescence*. There are very few substances which will part with all their water of crystallization at ordinary temperatures, nearly all requiring a high heat to effect the object. The act of driving off the water and reducing the crystals to the form of a dry powder is called *exiccation*. Some substances absorb water from the atmosphere, and, instead of becoming dry, grow moist, and in some cases are converted entirely into liquids. Such substances are said to be *hygroscopic*, and the act is termed *deliquescence*. A good example is found in potassium carbonate which has been exposed to moist air.

Mother-liquor.—The liquid remaining after the crystals have formed is called *mother-liquor*, and still contains some of the salt in solution. This liquid retains as much of the solid as the solubility of the latter and the temperature will permit. It may be evaporated, and another crop of crystals obtained, if desired. Where two salts are in solution, it is obvious that the more soluble salt must exist in largest proportion in the mother-liquor: hence salts are frequently separated from each other by taking advantage of their difference in solubility: thus cinchonine is separated from quinine. The process is termed *fractional crystallization*.

Crystallizing Vessels should be deep, and made of rough-glazed stone-ware or porcelain. On the large scale, wooden tanks or vats are employed. In the crystallization of alum the staves of the vats are retained in place by iron hoops, which may be tightened or loosened by screw-bolts. After the solid crust of alum is formed around the sides and bottom, the hoops are loosened, the staves removed, and a hole chiselled through the side crust near the bottom, to permit the mother-water to escape.

Collection, Draining, Washing, and Drying of Crystals.—Upon the small scale it is usually sufficient, after the mother-water is decanted, to break the crust of crystals, and, having placed a few pieces of clean broken glass in the throat of the funnel, to place the crystals upon them and drain thoroughly. They are then to be washed by pouring water carefully and sparingly upon them. If the crystals are very soluble in water, and it is necessary to free them entirely from mother-liquor, they must either be washed with alcohol or some liquid in which they are not so soluble, or with ice-cold water, used very carefully but quickly by pouring it drop by drop upon the crystals, so that the smallest quantity will suffice. After draining, they may be transferred to a double

sheet of filtering-paper, placed on a bed of two or three newspapers or cloths, loosely covered, and removed to a dry atmosphere. If the crystals are liable to effloresce, they should be turned several times, and bottled as soon as fairly dry. Deliquescent crystals, like those of chromic acid, may be dried by spreading them on a clean brick in a dry room. The mother-water will be gradually absorbed by the brick, and as soon as the crystals are dry they are transferred to a close vessel.

Intermediate Crystallization is a term used to define the process of crystallizing a substance which is comparatively insoluble in simple solvents, by causing it to dissolve in a hot solution of another substance. Of course the latter should be very soluble: the whole of the ordinarily insoluble salt will entirely crystallize out at the first attempt. Mercuric iodide may be made to crystallize in this way in brilliant scarlet crystals by dissolving it in a hot solution of sodium chloride, potassium iodide, or mercuric nitrate.

QUESTIONS ON CHAPTER XV.

CRYSTALLIZATION.

- What is crystallization?
- What are non-crystallizable substances called?
- In the classification of crystals, how many systems are recognized?
- What is meant by the centre of a crystal?
- What is meant by the axes of a crystal?
- What are substances called that crystallize in two forms? In three forms?
- In more than three forms?
- What are prismatic crystals? Tabular crystals? Laminar crystals? Acicular crystals?
- Upon what are the systems of classification of crystals based?
- What are those called in which the three axes intersect at right angles?
- What are those called in which the angles caused by the intersection are oblique?
- Describe the monometric, or regular system. The dimetric, or quadratic system. The trimetric, or rhombic system. The hexagonal, or rhombohedral system. The monoclinic, or oblique-prismatic system. The triclinic, or doubly-oblique prismatic system. The diclinic system.
- How can the form of a crystal be determined, as to which system it belongs?
- What is the instrument for measuring the angles of crystals called?
- What is meant by cleavage?
- Under what circumstances does the process of crystallization generally take place?
- Do solids ever become crystallized without becoming liquefied?
- Give an example.
- By what various methods may crystals be obtained?
- How may crystals be formed by fusion?
- Do weak or strong solutions form crystals of the most perfect form?
- How may large crystals be obtained?
- How may small crystals be obtained?
- Are crystals more readily deposited on rough or smooth surfaces?
- How may perfect geometrical crystals be produced?
- In what cases is the process of obtaining crystals by evaporation useful?
- How may gold and copper be crystallized?
- Give an example of the production of crystals by precipitation.

Also when two solutions are mixed together.
Why does the addition of alcohol to syrup cause the sugar to crystallize?
What is water of crystallization?
What is interstitial water?
What is water of decrepitation, and why is it so called?
What is efflorescence?
What is exsiccation?
What substances are hygroscopic?
What is deliquescence?
Give an example of a deliquescent salt.
What is mother-liquor?
What is meant by fractional crystallization?
How should crystallizing vessels be made?
How is alum usually crystallized?
On the small scale, how may crystals be obtained?
What is meant by intermediate crystallization?

CHAPTER XVI.

GRANULATION AND EXSICCATION.

By granulation is meant the process of heating the solution of a chemical substance, with constant stirring, until the moisture has evaporated, and a sabulous, coarse-grained powder is produced. It is a convenient method of obtaining many substances in the form of powder: indeed, the practical advantages of granulated powders are so well recognized now at the prescription-counter, that their use in preference to large crystals is rapidly extending. This is particularly the case with salts which are not very soluble in water, or which are commonly found in commerce in hard, tough, crystalline lumps or masses. The process of granulation is one which requires care, but no great amount of skill. The solution of the substance is generally evaporated rapidly until a pellicle forms upon the surface. Then the heat is moderated, in order to prevent spurting and caking: great care must be exercised at this stage of the process to stir the mass constantly, as the tendency to form a crust on the bottom is very great, and when this hard crust is broken up by the stirrer it is very difficult to avoid the formation of lumps; but if the crust is not allowed to form, by keeping the bottom of the dish clean through constant stirring, the salt will separate in distinct grains, which will not adhere to each other. Towards the end of the process the heat should be very moderate, and the product should be introduced at once into a clean, warm, dry bottle.

Granulated Effervescent Salts are made by mixing the dry powders with dry tartaric acid and sodium bicarbonate and moistening the mixture with strong alcohol. The pasty mass is passed through a sieve, and the granules dried quickly in a hot room, sifted, and filled into bottles, which must be hermetically sealed to prevent the access of moist air.

Exsiccation is the process of depriving a solid crystalline substance of its water of crystallization or moisture by heating it strongly.

The product is usually a fine powder, and the original crystalline condition of the substance may be restored by redissolving it and evaporating the solution. The process is conducted by exposing the crystals to the air or a warm temperature until they are effloresced, and then gradually heating, with stirring, until they cease to lose weight; the residue is then powdered and kept in well-stopped bottles. The object of exsiccation is to increase the strength of substances and thereby fit them for special applications. For instance, exsiccated sulphate of iron is preferred as an ingredient in pills, because sixty grains contain as much ferrous sulphate as one hundred grains of crystallized ferrous sulphate, and the pills can therefore be made one-third smaller. The mass is also much more readily formed from the finely-powdered exsiccated salt.

CHAPTER XVII.

DIALYSIS.

DIALYSIS is the process of separating crystallizable substances from those which do not crystallize, by placing a mixture of their solutions upon a porous diaphragm which has its under surface in contact with water. This remarkable process was discovered by Graham in 1861. He termed the substances which had the power of passing through the septum or diaphragm *crystalloids*, because they always have the crystalline form, and those which remained upon the diaphragm *colloids*, from their resemblance to gelatin and because they never crystallize. He also pointed out the differences between the two classes. Crystalline bodies, or crystalloids, are diffusible, brittle, hard, with clearly-defined angles and flat faces: their solutions are free from viscosity, and their reactions energetic and quickly effected. (Example, sugar.) Colloidal bodies, on the other hand, are not diffusible: they are tough, with more or less softness of texture. The mathematically-arranged angles and faces of crystals are replaced in colloids by rounded, irregular outlines, the fracture often being curved or conchoidal. Water of crystallization is replaced by water of gelatination, and the solution of colloids is, when concentrated, viscous or gummy, and their reactions are sluggish or inert. (Examples, gum, glue, starch, dextrin, gelatin, albumen, extractive matter.)

A thin layer of gelatin interposed between two liquids offers no obstacle to the passage of the crystalloids from one to the other, while it completely prevents the passage of the colloids: this property belongs not only to gelatin, but to other substances having a similar molecular constitution, as bladder, parchment, etc., of which the most convenient is the texture known as *parchment-paper*, prepared by immersing unsized paper in a cold mixture of two measures of sulphuric acid and one of water, and subsequently washing it thoroughly to free it from acid.

Upon the principles stated above Prof. Graham contrived a very simple apparatus which he called the dialyzer (see Fig. 299). It consists of two parts, one a circular glass recipient (*b*), about a foot in diameter and six inches deep, the other (*a*) a similar circular vessel, from six to ten inches in diameter and about two inches deep, the circumference of which consists of a band of gutta-percha and the bottom of a circular piece of parchment-paper, the edges of which are brought over the lower rim of the gutta-percha band nearly to the top, and fastened outside of it by a string or by a narrow hoop of gutta-percha. The first part, or circular basin, is to receive distilled water, and should contain from five to ten times the quantity of the liquid that may be introduced into the smaller vessel. The latter is to float upon the surface of the water in the former, and is to receive the liquid to be submitted to dialysis, which should not

be more than half an inch deep on the paper bottom. It is important that the parchment-paper employed should have no rent or aperture, and should be brought well up and secured on the outside of the gutta-percha to prevent the liquid from passing between them. If any liquid containing a mixture of colloid and crystalloid matter be placed in the floating vessel, after some hours it will be found that a portion of the latter has passed through the parchment-paper, and is held in solution

FIG. 299.

Dialyzer.

FIG. 300.

Dialyzer.

by the distilled water of the larger vessel, while the colloid matter remains. The distilled water thus impregnated is called the *diffusate*. The parchment-paper, or any similar material used as the septum, is applicable to the dialysis of substances held in watery solution only, and will not answer for alcoholic or ethereal liquids. The hard-rubber sieve, which has been already noticed (see Fig. 300), makes an excellent dialyzer if floated upon pure water in an evaporating dish or beaker. Fig. 301 shows another form, in which the glass dialyzer has its upper edge expanded into a flat shoulder, which rests upon the upper edge of the round dish¹ containing the water. This has the advantage of keeping the diffusate covered whilst the dialysis is progressing. It is obvious that very different arrangements might be made to accomplish the same ends. Thus, a bladder three-fourths filled with a mixture, suspended in a jar of distilled water, would yield similar results. Graham's apparatus is preferable to others only for its convenience.

FIG. 301.

Dialyzer.

The following applications of the process of dialysis have been made:

1. It facilitates in many instances to a considerable extent the separation of the active matter of any artificial or natural mixture from the inert and useless, the former being very often crystalline and the latter colloidal. Thus, infusions or decoctions of medicines, such as opium, belladonna, aconite, etc., submitted to dialysis might give up more or less completely their crystalline principles, such as the salts of morphine, atropine, aconitine, etc., to the water, while the gummy, resinoid, extractive, and coloring matters, etc., might remain behind. In effecting

¹ This vessel is sometimes called the "exarysator."

the analysis of organic bodies, one of the most embarrassing problems is to get rid of the inert principles which interfere with the action of chemical reagents, and the process of dialysis may here often be brought to the aid of the operator. 2. In searching for poisons in organic mixtures, as in the contents of the stomach, in which the application of tests is often rendered abortive by the colloidal matter present, the problem of the presence of the poison may sometimes be solved by submitting the suspected matter to dialysis. The poison will often be found in the diffusate separated from the other matters, and may then be detected by the ordinary tests. 3. In pharmaceutical operations it often happens that salts and other crystallizable substances are thrown away as refuse matter because they would not repay the cost of time and material necessary for their recovery. It is possible that by this simple, inexpensive process these substances may be separated from the useless matters and thus saved. 4. An economical application has been made of the process to the restoration of salted meat to the fresh state. If some salt beef with its brine be enclosed in a bag of material suitable for dialysis, as of untanned leather, and the bag be immersed in sea-water, in the course of some days the beef and brine will have been rendered sufficiently fresh for use, the salt having passed out into the sea-water. B. F. McIntyre, of New York, gave a great deal of attention to the practical applications of dialysis, and introduced a class of preparations called *Dialysates*. These were prepared from various drugs by dialysis, and it was claimed that they contained the active crystallizable constituents in their original combination, deprived of inert colloidal substances.

Dialyzed iron, or *Ferrum Dialysatum*, is a colloidal preparation made by placing a mixture of basic ferric chloride and ammonium chloride upon a septum: the crystalloids (ammonium chloride and ferric chloride), with any free acid, pass into the diffusate, leaving the neutral colloidal liquids upon the septum.

QUESTIONS ON CHAPTERS XVI. AND XVII.

GRANULATION, EXSICCATION, AND DIALYSIS.

- What is meant by granulation?
- How are granulated effervescent salts prepared?
- What is exsiccation, and what is its object?
- What is dialysis?
- What are crystalloids? Give an example.
- What are colloids? Give examples.
- What is the most convenient substance to use for a dialyzing medium?
- How is it prepared?
- Describe Professor Graham's dialyzer.
- What is the liquid called in which crystalloid matter is dissolved, which has been passed through a dialyzer?
- What applications of the process of dialysis have been made?
- What preparations have been called dialysates?
- What is dialyzed iron?

CHAPTER XVIII

EXTRACTION.

UNDER this head are included those operations which have for their object the separation of the soluble principles from drugs by treating them with a liquid capable of dissolving them, which is called the *menstruum*. Extraction differs from solution in the fact that the presence of insoluble matter is implied in the former, and the soluble constituents must therefore be *extracted* or separated, by appropriate methods, from those which are insoluble. The principal modes of extraction employed in pharmacy at present are as follows: 1. Maceration and expression. 2. Percolation. 3. Digestion. 4. Infusion. 5. Decoction. Maceration and expression are old processes, and they will be considered first; percolation is much more important and useful, and will be treated of in a separate chapter; digestion is merely a modified form of maceration. Infusion and decoction are processes which are used in producing separate classes of official preparations: hence they will be considered in Part II.

MACERATION.

The process of *maceration*, which is of ancient origin, consists simply in soaking the properly comminuted drug or substance in the *menstruum* until it is thoroughly penetrated and the soluble portions softened and dissolved. The usual method is to introduce the drug or substance into a bottle with the *menstruum*, cork it tightly, and agitate it occasionally for a period ranging from two to fourteen days; then to pour off the liquid, express the residue to avoid waste, and filter the mixed liquids. An advantage is sometimes gained by suspending the ground drug, tied in a bag, in the upper part of the *menstruum* (see Fig. 302): this is sometimes termed *circulatory displacement*. Maceration is the process directed by the German Pharmacopoeia exclusively in preparing tinctures: the drugs are ordered in all cases to be macerated in definite weights of alcohol for a week in a closed bottle, in a shady place, with frequent agitation, at a temperature of about 15° C. The liquid is then separated by strain-

FIG. 302.

Circulatory displacement.

ing or expressing from the insoluble residue, and, after having been allowed to settle, it is filtered. Evaporation during filtration is to be avoided as much as possible. Maceration has no advantages over percolation in making the greater number of liquid preparations from drugs, except in the hands of the careless or unskilful. If an operator possesses no knowledge whatever of the process of percolation, it is safer to trust to maceration, for here no particular skill or judgment is necessary; the soaking process is completed in due time, and the separation of the absorbed liquid, whilst laborious and uncleanly, has at least the merit of leaving the tincture uniform in strength; if the process of expression is not thoroughly performed, pecuniary loss results, but the finished preparation is uniform. On the other hand, in percolation, if the operator has, through careless packing, failed to exhaust thoroughly the drug with the amount of menstruum used, a portion of the activity of the drug remains in the residue, which is thrown out, and the preparation is thus deficient in strength. In making tinctures by maceration, the practice of weighing liquids, as directed in the German Pharmacopœias, is seen to the best advantage, although, of course, the principal objection to preparations made from weighed liquids still exists,—the necessity for a calculation to determine the dose as compared with that of the drug. The tincture must always be administered by measure, and hence a teaspoonful or a fluidrachm should bear a certain relation to the drug, which is readily ascertained without resorting to a problem in specific gravity.

Digestion is that form of maceration which consists in the application of a gentle heat to the substance which is being treated. It is used in those cases where a moderately elevated temperature is unobjectionable, the heat increasing the solvent powers of the menstruum.

QUESTIONS ON CHAPTER XVIII.

MACERATION.

- What is meant by extraction?
- What is meant by menstruum?
- What are the principal modes of extraction employed in pharmacy?
- What is meant by maceration?
- What is meant by circulatory displacement?
- How are all tinctures directed to be prepared by the German Pharmacopœia?
- Which is the better process in unskilled hands, maceration or percolation, and why?
- What is the principal objection to preparations made from weighed instead of measured liquids?
- Define digestion.

CHAPTER XIX.

EXPRESSION.

EXPRESSION is the process of *forcibly* separating liquids from solids. It is generally effected by the use of a press, although for many pharmaceutical operations, upon the small scale, the use of straining-cloths with hand-pressure suffices. Pressing-cloths are generally employed, but they are troublesome, and of late years strong efforts have been made to construct presses which could be used without them. At least six mechanical principles are recognized in the operation of expression as now practised: namely, by the use of—1. The spiral twist press. 2. The screw press. 3. The roller press. 4. The wedge press. 5. The lever press. 6. The hydraulic press.

1. **The Spiral Twist Press.**—The principle of this press is best and most practically illustrated in the usual process of expressing a substance contained in a cloth with the hands. The mixture to be expressed is placed in a bag or a cloth held in one hand by the four corners, which are gathered together, and the lower portion, or bag, is rotated with the other hand, so that, beginning at the top, the point of smallest diameter, the strainer is spirally twisted, the pressure forcing the liquid between the meshes of the cloth. Figs. 303 and 304 show Gigot's press, in which this principle is used upon a larger scale. Upon the left hand is shown a sectional view of the press as it appears when filled with material. The perforated cone, *d*, forms the bottom of a conical strong cloth tube; the upper end is connected with a funnel, *l*, which is so constructed that none of the material that has passed down into the bag can leak back. The lower portion of the cloth is secured to a ring, which may be fastened, so that it will not rotate when the press is used. If the upper end of the cloth is twisted, the space occupied by the material is contracted, and the liquid oozes through the meshes of the cloth. The dry residue is discharged by untwisting the cloth and unhinging the bottom, which opens downwards.

2. **The Screw Press** is the most useful of all forms for pharmaceutical work where very great power is not desired. The screw is always used in combination with one or more levers, and this form of press is employed in great variety to accomplish special purposes. There are two forms of screw presses: 1. Single-screw presses. 2. Double-screw presses. Each of these forms may be subdivided into

those in which the position of the screw or screws is *vertical*, and those in which the position of the screw or screws is *horizontal*.

1. *Single-Screw Presses*.—In this form of press the single screw is generally used in a vertical position, and operated with a lever or a combination of levers. It is the simplest kind of press, and if well made will admirably answer the general purposes of the pharmacist. The screw should have a square-faced thread, and be well made. The plunger should be disconnected from the end of the screw, or else move freely around it. The parts of the press which come in direct contact with the material to be pressed should be coated with tin or porcelain, so that liquids containing acid or tannin shall not be affected injuriously. Fig. 305 shows a press of this description, made by H. Troemner, of Philadelphia. A perforated tin case accompanies the press. This may be used when pressing bulky drugs, like arnica flowers, and press-cloths may be abandoned. The best material for press-cloths

FIG. 305.

Troemner's press.

FIG. 306.

German single-screw press.

is that which is especially made for the purpose. It is twilled and elastic in one direction, and, if proper care be taken when enveloping the material and introducing it into the press, the same cloth may be used many times, as the pressure causes the meshes to open without breaking the threads. The manufacturers of linseed oil use press-cloth largely. For small operations, in the absence of press-cloth, which is very expensive, new Russia crash may be used. The press-cloth should be moistened, if possible, with some of the same liquid expressed at a previous operation. Water answers very well if the liquid is aqueous. The substance to be pressed is laid upon the cloth, and one corner of the cloth laid over it. The opposite corner is then placed upon the first; next one of the remaining corners is laid in the same way upon the first two, followed by its opposite. The corners should be folded over so that a square, somewhat flat package is produced, in size somewhat smaller than the press-plate, especial care being observed to suit the quantity of material to the capacity of the press. If too much is taken, the press-cloth will be too small to permit of folding it over sufficiently; the corners

of the package will therefore not withstand the pressure, portions of the material itself will ooze out, and the whole operation must be repeated. The principal objection to the single-screw press is, that unless the material in the press is nearly homogeneous, so that the press-cake is equally pressed upon at all points, unequal action results, the press-block is pressed against one side of the case, causing violent friction and resistance, and the thread of the screw binds upon one side, full pressure thus being defeated; whilst the main objection to the vertical screw is, that the press-block and plate must be in a horizontal position, so that the liquid pressed out adheres to the cloth, and cannot be collected readily without tilting the press. Fig. 306 is an illustration of a German single-screw press which is well adapted for pressing the residues from macerated tinctures. The large lip of the containing vessel is a practical convenience, whilst the lever, L, in combination with the catch, C, gives unusual power and ease in working, for a small press. In the horizontal screw press, the jaws being vertical, there can be no obstruction to the dropping of the expressed liquid, which may be caught in a vessel placed immediately under it. Oberdoffer, of Hamburg, Germany, makes a very powerful horizontal screw and compound lever press. Fig. 307 illustrates a novel horizontal screw press, made by the Enterprise Manufacturing Company, of Philadelphia, which is operated

essentially of a tapering cylinder, with a hopper on the upper side at its large end, and a strong screw fitting closely to the inner surface of the case, the thread of which diminishes in size as the screw becomes smaller. Along the under side of the cylinder is formed a channel adapted to receive a perforated brass plate. This latter has a transverse concavity corresponding to that of the inner surface

of the cylinder, and the perforations allow the escape of the expressed fluids into the channel or gutter beneath, from which it escapes by a proper outlet. The substance to be expressed is placed in the hopper, and, the crank attached to the screw being turned in the proper direction, the thread of the screw compresses the substance into a smaller and smaller space, until finally it is discharged at the farther end of the cylinder in a comparatively dry state. A large screw, passing through a removable end of the conical cylinder, regulates the size of the outlet, and serves to increase or diminish the amount of pressure to which the mass is subjected by the screw. The brass plate in the bottom of the machine can be replaced by others having perforations of different sizes. Clogging of the holes by bits of wood, stems, or seeds is prevented by the shear-like action of the edge of the screw-thread, which shaves off the protruding fragment, while the rest is forced through the perforation. To increase the power of the press upon slippery substances, the inside of the casing has a few longitudinal

FIG. 307.

Enterprise press.

or spiral grooves at a greater or less angle to the direction of the screw-thread. Arrangements are provided for detaching the casing from the

FIG. 308.

Enterprise press.

screw, and for attaching the whole to the edge of a table or bench. Fig. 308 shows the press as taken apart.

2. Double-Screw Presses are preferred by many. These are always of the horizontal screw form, and in Fig. 309 is shown one made as proposed by Chas. T. George, of Harrisburg, Pa.

A strong and substantial framework, made of ash wood, forms the base. Two pieces of timber rest upon this frame, one firmly attached by an

FIG. 309.

George's double screw press.

iron rod and keepers to one end of the frame or table, and the other free or movable, both blocks being bored at the same distance from the end with smooth holes to receive the two iron screws.

Upon the movable block, and opposite the holes, a female nut of bell-metal is firmly fixed. Upon the inner face of the two timber blocks, iron castings, saddle-shaped and hollow, are inserted, flush with the face of the block, each capable of holding six pints of boiling water, and each casting having a hole on top to receive hot water or steam : a brass pet-cock is fixed at the bottom to discharge the chilled water.

The two iron screws pass through the holes of both blocks of timber, the head of each screw having an iron cog-wheel attached to it ; into the cogs of each wheel a pinion-wheel is firmly fixed, which in turn is fastened to a short shaft having at its end an iron fly-wheel.

By turning this wheel both screws are evenly and rapidly rotated without danger of bending or breaking, and consequently one block is drawn surely and with great power against the other, thus expressing whatever drug may be placed in a sack of strong linen towelling between the two blocks of timber.

It is apparent that the double-screw press is very powerful, and, the pressure being equalized, good results are obtained.

3. *The Roller Press* is used upon the large scale for pressing oily seeds, fatty substances, etc. Its principle is thoroughly shown in the well-known clothes-wringer, which, although made for the laundry, serves as a very efficient press for many substances. Care must be taken to apply the force gradually to the bag containing the berries or other material to be pressed, and not to use it upon substances which will soften or dissolve the rubber rollers.

4. *The Wedge Press*.—This form of press is powerful, economical, and inexpensive. It is objectionable principally on account of the noise necessarily made in driving the wedges. Fig. 310, taken from Knapp's Technology, illustrates the wedge press. The filled cloths are laid between strong plates, *h* and *g*, and placed in a square space cut in a solid block of oak wood or in a cast-iron case, *b*, and the plates are forced nearer and nearer to each other by driving in the wooden wedges which occupy the remaining space. One of these wedges, *a*, serves to facilitate the disconnection of the apparatus ; the strokes which drive in the wedge *i* tending, from the reverse position of *a*, to drive the latter out ; *c*, *e*, and *d* are intermediate pieces to prevent the wedges from coming into immediate contact. The pressing-plates are each provided with three side ribs : the immovable ones, *g*, *g*, press against the sides of the case, and the movable ones, *h*, *h*, against the intermediate wedges, *c*, *e*, and are pierced with numerous holes to allow the liquid to flow out more easily. On filling the press, the wedge *a* must be suspended (by a string) at a distance from the bottom, so that the apparatus may be easily taken to pieces. The liquid trickles from the pressing-plates through the pierced horizontal plates, *n*, *n*, upon which these rest, into the pipe *o*. Both *a* and *i* are driven by separate stampers, which are raised by a toothed wheel, or mallets may be used.

FIG. 310.

Wedge press.

5. *The Lever Press.*—The only advantages possessed by this press over those previously noticed are its cheapness, and that it may be made by any one possessed of even moderate mechanical abilities. Prof. Procter recommended the following method of construction. "A piece of timber twelve feet long, and with lateral dimensions sufficiently great to be inflexible with the force to be applied to it, has one of its ends securely attached to a wall or upright post in such a manner as to admit of the motion of the other end. The pressing-box being placed about one foot from the fixed end, on a firm block of wood, is subjected to the action of the lever by placing a piece of wood vertically between the piston-block of the pressing-box and the lever. It is obvious that a weight of one hundred pounds at the opposite end causes a downward pressure equal to eleven hundred pounds at the box. The pressing-box most usually employed is a cylinder, closed at one end, made of thick tinned-iron, secured with bands of the same material, which are soldered on, and between these, numerous holes are perforated. This cylinder is set in a tin dish with a lateral spout. The piston-block is constructed of hard oak wood with the grain running transversely to its axis." The objection to this press is that, compared with other presses, it yields but little power in proportion to the space occupied; but as an offset to this it can be made to work simply and quickly.

6. *The Hydrostatic or Hydraulic Press.*—Of the presses heretofore mentioned, each has some especial advantage or use, but each has also some fault or objectionable feature. The spiral twist is not powerful, and its action is limited. The screw presses of both varieties have friction to contend with. The friction of a screw increases with the intensity of the pressure applied, and when a certain limit is reached all further force applied is wasted, and, if persisted in, involves the destruction of the press. The roller press is very limited in its action; the lever

FIG. 311.

Hydraulic press.

press is unwieldy and not powerful; the wedge press is noisy and can be used only for special purposes. The hydrostatic press is costly, but after the first cost it is the most economical, because the greatest power is obtained at the expense of the least labor. The principle is shown in Fig. 311. It must be remembered that the molecules of fluids move freely in contact with one another almost without friction, and, according to Pascal's law, "Pressure exerted anywhere upon a mass of liquid is transmitted un-

diminished in all directions, and acts with the same force on all equal surfaces and in a direction at right angles to those surfaces."

Although it has been proved that liquids are to a slight extent compressible, it has also been shown that they are perfectly elastic: so that

if a plug be forced into a liquid which entirely fills a vessel, the pressure is felt equally upon every square inch of the surface of the vessel and upon every square inch of the surface of any body immersed in the liquid, and if the pressure is removed from the plug it will be immediately forced out of the vessel and the liquid will at once regain its original volume. Now, if a vessel is constructed having two columns communicating at the bottom, as in Fig. 311, and if water or other fluid is placed in it, it will be found that a pressure of one pound applied at the piston in the tube, B, will be communicated to every portion of the lower surface of the ram, R. If the area of R is ten times greater than that of B, it follows that a pressure of one hundred pounds on A, conveyed through the lever, exerts an upward pressure of one thousand pounds on R. By increasing the area of the ram the power may be greatly

multiplied, so that pressure applied by one man on the lever may be communicated to the liquid and made to exert an upward pressure of several tons. Fig. 312

shows a pharmaceutical press made by R. Dudgeon, of New York, constructed on the principle of hydrostatic pressure. In order to economize space, by an ingenious system of valves one of the cylinders is contained within the other, and by pumping the oil into the outer vessel the ram carrying the platen is forced upward. The platen has a groove around its edge communicating with a spout for carrying off the expressed liquid. Press-cloths may be used to contain the material to be pressed, or a very strong perforated case is supplied. The upper plate is very strongly secured by bolts and nuts, and press-blocks

covered with tinned iron are employed to fit into the perforated case if desired. The weight of one man, one hundred and fifty pounds, applied to the end of the lever will produce an upward pressure equivalent to ten tons. This is the most powerful press available for pharmaceutical purposes, and, although expensive, its first cost will be more than offset by its durability and by its economy of power whenever pressure greater than that afforded by the smaller presses is needed.

The following maxims should be observed in operating presses :

FIG. 312.

Dudgeon's press.

1. All moving parts of the press should be well lubricated before attempting expression.

2. Pressure should be *gradually* increased; sudden strains should always be avoided. If this precaution is neglected, either the press-cloth or press-bag will burst, the finer solid particles will be forced through the meshes, or breakage of press-plates or press will result.

3. Pressure, to secure the best results, should be unrelaxed, but intermittent. After apparently reaching the limit of compression, the action of the press should cease, and if the pressure be maintained unrelaxed it will be found that in a short time further pressure may be applied and more liquid separated. In this way, by alternately exerting pressure and resting, the utmost limit of the power of the press may be gradually reached without undue strain. Screw presses have more ability to retain pressure than hydraulic presses: the valves of the latter frequently leak slightly, and the pressure has to be continually renewed.

QUESTIONS ON CHAPTER XIX.

EXPRESSION.

What is expression?

How many mechanical principles are recognized in the operation of expression, and what are they?

What is the principle of the spiral twist press?

What press is most useful in pharmaceutical operations, where very great power is not desired?

How many forms of screw presses are there?

Describe a single screw press.

What is the best material for press cloths?

What is the principal objection to the screw press?

Describe the Enterprise Co.'s horizontal screw press?

Describe the double screw press as proposed by Mr. Charles T. George.

What is the principle of the roller press?

Describe the wedge press.

What objection is there to it?

Describe the lever press.

What are its advantages?

What is an objection to it?

What is the principle of the hydrostatic or hydraulic press?

What are its special advantages?

In operating presses, what maxims should be observed?

Which can retain pressure most effectually, screw presses or hydraulic presses, and why?

CHAPTER XX.

PERCOLATION.

Percolation, or **Displacement**, is the process whereby a powder contained in a suitable vessel is deprived of its soluble constituents by the descent of a solvent through it. The importance of this process cannot be overestimated, as the progress made in pharmacy in America during the last half-century is largely due to the study and development of percolation, and the introduction of preparations which are the direct outgrowth of the process.

History.—The practice of exhausting wood-ashes of their soluble constituents by pouring water upon them after their introduction into a conical-shaped wooden vessel called a lye-hopper is an ancient one, and the process is still practised and known as *lixiviation*. The first attempt on record to apply the principle to powdered drugs was made by Count Real, who about the year 1815 invented a press which consisted of a metallic cylinder with a stop-cock in the bottom and containing a perforated diaphragm for supporting the substance, and with a tight cover at the top, to which was attached an upright tube, ten or twelve feet high, having a funnel soldered to its upper extremity: the cylinder was packed with the coarsely-ground drug, and water poured into the tube. The pressure of the column of water was so great, however, that the principal difficulty in using the apparatus was in securing tight joints, and in preventing the incomplete exhaustion of the drug on account of the too rapid passage of the water through it. M. Robiquet subsequently made some experiments to determine the power of ether as a solvent in extracting the fixed oil from the bitter almond: he observed that ether poured on powdered bitter almond displaced the fixed oil without mixing materially with it, and he published his observation. It was reserved, however, for the Boullay brothers, of Paris, in 1833, to apply the ideas of Real and Robiquet to drugs and medicinal substances in general, and to them belongs the credit of first demonstrating the value of the process of percolation in its pharmaceutical applications. The researches of the Boullays at once attracted the attention of American pharmacists, and the labors of Duhamel, Procter, Grahame, Squibb, and others during the last half-century, and the adoption of the process in the Pharmacopœias of 1840, 1850, 1860, 1870, and 1880, sufficiently show the character of the growth in favor of percolation. In Great Britain, France, and Germany the process is well known and is practised to some extent, but maceration still holds in these countries the chief place as a means of extracting the soluble principles of drugs.

Principle of Action.—*When a powder placed in a cylindrical vessel with a porous diaphragm below, is treated from above with a liquid capable of dissolving a portion of its substance, that portion of the fluid first in contact, in passing downward, exercises its solvent power on the successive layers of the powder until saturated, and is impelled downward by the combined force of its own gravity and that of the column of liquid above it, minus the capillary force with which the powder tends to retain it.* If the quantity of liquid added is not more than enough to satisfy the capillarity of the powder, no liquid will pass the diaphragm; but the careful addition of liquid upon the top displaces that absorbed in the powder without mixing materially with it, and takes its place, to be in turn displaced by a fresh portion of liquid. The instrument used to hold the powder is called a *percolator*; the liquid poured on top of the powder, the *menstruum*; the liquid coming from the percolator impregnated with the soluble principles, the *percolate*. In order thoroughly to understand the process of percolation as applied to powdered drugs, it must be remembered that the soluble principles of vegetable substances are in a hard and dry condition, and are generally contained in cells which are more or less disintegrated by the process of grinding: if the soluble principles could be perfectly separated from the insoluble cellular substance by any means, and be deposited in the interstices of the ground particles, percolation would indeed be a rapid process, for the descending column of liquid would immediately dissolve the soluble principles, which would be found in the receiving vessel, while the insoluble substances would remain in the percolator, and the separation would then be easily accomplished. But the powdering of the drug very partially separates the soluble principles from the insoluble, and the finest dust of the powder always contains a larger proportion of the soluble principles than of the insoluble substance, because the latter, often being largely ligneous, offers the greatest amount of resistance to disintegration: hence the first portion of the percolate is always the most dense, the most highly colored, and contains the largest proportion of the soluble principles, because the first portion of menstruum, in its descent through the powder, has the first opportunity to come in contact with the largest proportion of the soluble principles, which are to be found in the finer dust scattered through the powder, and in the thoroughly disintegrated particles, which offer but slight resistance to the passage of the menstruum. In every well-conducted experiment in percolation it will be noticed that, as the operation proceeds, each succeeding portion of percolate is less highly colored and less active than the one preceding it; and in the case of drugs containing easily-dissolved coloring-matter, an examination of the percolate will show that the shading is very marked, the lowest portion being very dense and dark-colored, the upper portion almost colorless, whilst in the intermediate liquid the gradations of the tint are clearly perceptible.

The directions of the United States Pharmacopœia upon percolation are as follows:

The process of percolation, or displacement, directed in this Pharmacopœia, consists in subjecting a substance or substances, in powder, contained in a vessel called a percolator, to the solvent action of succes-

sive portions of menstruum in such a manner that the liquid, as it traverses the powder in its descent to the recipient, shall be charged with the soluble portion of it, and pass from the percolator free from insoluble matter.

When the process is successfully conducted, the first portion of the liquid, or percolate, passing through the percolator will be nearly saturated with the soluble constituents of the substance treated; and if the quantity of menstruum be sufficient for its exhaustion, the last portion of the percolate will be destitute of color, odor, and taste, other than that possessed by the menstruum itself.

The percolator most suitable for the quantities contemplated by this Pharmacopœia should be nearly cylindrical, or slightly conical, with a funnel-shaped termination at the smaller end. The neck of this funnel-end should be rather short, and should gradually and regularly become narrower toward the orifice, so that a perforated cork, bearing a short glass tube, may be tightly wedged into it from within until the end of the cork is flush with its outer edge. The glass tube, which must not protrude above the inner surface of the cork, should extend from one and one-eighth to one and one-half inch (3 to 4 centimeters) beyond the outer surface of the cork, and should be provided with a closely fitting rubber tube, at least one-fourth longer than the percolator itself, and ending in another short glass tube, whereby the rubber tube may be so suspended that its orifice shall be above the surface of the menstruum.

The shape of a percolator should be adapted to the nature of the drug to be operated upon. For drugs which are apt to swell, particularly when a feebly alcoholic or an aqueous menstruum is employed, a *conical* percolator is preferable. A *cylindrical* or only slightly tapering percolator may be used for drugs which are not liable to swell, and when the menstruum is strongly alcoholic, or when ether or some other volatile liquid is used for extraction. The size of the percolator selected should be in proportion to the quantity of drug extracted. When properly packed in the percolator, the drug should not occupy more than two-thirds of its height. The percolator is best constructed of glass or stoneware, and is prepared for percolation by gently pressing a small tuft of cotton into the space of the neck above the cork, a small layer of clean and dry sand being then poured upon the surface of the cotton to hold it in place.

The powdered substance to be percolated (which must be uniformly of the fineness directed in the formula, and should be perfectly air-dry before it is weighed) is put into a basin, the specified quantity of menstruum is poured on, and it is thoroughly stirred with a spatula, or other suitable instrument, until it appears uniformly moistened. The moist powder is then passed through a coarse sieve—No. 40 powders, and those which are finer, requiring a No. 20 sieve, whilst No. 30 powders require a No. 15 sieve for this purpose. Powders of a less degree of fineness usually do not require this additional treatment after the moistening. The moist powder is now transferred to a sheet of thick paper, and the whole quantity poured from it into the percolator. It is then shaken down lightly and allowed to remain in that condition for a period varying from fifteen minutes to several hours, unless otherwise directed;

after which the powder is pressed, by the aid of a plunger of suitable dimensions, more or less firmly, in proportion to the character of the powdered substance and the alcoholic strength of the menstruum; strongly alcoholic menstrea, as a rule, permitting firmer packing of the powder than the weaker. The percolator is now placed in position for percolation, and, the rubber tube having been fastened at a suitable height, the surface of the powder is covered by an accurately fitting disk of filtering-paper, or other suitable material, and a sufficient quantity of the menstruum poured on through a funnel reaching nearly to the surface of the paper. If these conditions are accurately observed, the menstruum will penetrate the powder equally until it has passed into

FIG. 313.

Official percolator.

FIG. 313a.

Official percolation.

the rubber tube and has reached, in this, the height corresponding to its level in the percolator, which is now closely covered to prevent evaporation, and the apparatus allowed to stand at rest for the time specified in the formula.

To begin percolation, the rubber tube is lowered and its glass end intro-

duced into the neck of a bottle previously marked for the quantity of liquid to be percolated, if the percolate is to be measured, or of a tared bottle, if the percolate is to be weighed; and by raising or lowering this recipient, the rapidity of percolation may be increased or lessened as may be desirable, observing, however, that the rate of per-

colation, unless the quantity of material taken in operation is largely in excess of the pharmacopoeial quantities, shall not exceed the limit of ten to thirty drops in a minute. A layer of menstruum must constantly be maintained above the powder, so as to prevent the access of air to its interstices, until all has been added, or the requisite quantity of percolate has been obtained. This is conveniently accomplished, if the space above the powder will admit of it, by inverting a bottle containing the entire quantity of menstruum over the percolator in such a manner that its mouth may dip beneath the surface of the liquid, the bottle being of such shape that its shoulder will serve as a cover for the percolator.

Fig. 313a illustrates an official percolation (U. S. 1880), the shape of the percolator and the arrangement of the exit-tubes being strictly according to the directions.

Shape of the Percolator.—In the U. S. Pharm. 1880 the shape and size of the cylindrical percolator preferred for pharmacopœial operations were definitely fixed (see Fig. 313). There can be no question that the glass cylindrical percolators (see Fig. 314) commonly furnished by the manufacturers are proportionally too broad for use in percolating drugs for fluid extracts where the quantity of drug is large in proportion to the quantity of menstruum; but for ordinary tinctures, where the conditions are reversed, they answer admirably. The inference then is obvious, the pharmacist should have percolators not only of different sizes, but also of different shapes. Fig. 315 shows the narrow percolator recommended by Prof. Oldberg. It is narrower than the cylindrical percolator directed by the U. S. Pharm. 1880. The studies on percolation during the last half-century have been directed towards simplifying the process, and the elaborate apparatus of Count Real and others has been replaced by the ordinary percolator and funnel. The conical percolator of the Pharmacopœia is understood to be a glass funnel (see Fig. 316).

FIG. 314.

Plain percolator.

FIG. 315.

Oldberg's percolator.

FIG. 316.

Conical percolator.

Judgment is required in selecting a percolator for an operation. In making a fluid extract a comparatively narrow percolator should be chosen, because it is desirable that the menstruum should traverse a higher column of powder, for every drop of the menstruum must be economically applied. The rate of flow of the percolator is thereby proportionally diminished, the percolate becomes saturated more rapidly, and thus the operation is more easily controlled, provided the limit has not been exceeded. *The character of the drug influences the limit.* For instance, one which contains a large quantity of soluble matter, like kino, could not be successfully percolated in a narrow percolator, because the percolate would soon become so dense that it would cease to descend. In making tinctures and weaker preparations, a wider percolator is to be preferred, because the quantity of menstruum is greatly in excess of the quantity necessary to exhaust the drug, and more rapid action is desirable. Figs. 317, 318, and 319 show three percolators of the same height, but of very different shapes. Exactly the same weight of powder is represented in each. The great difference in the height of the columns of powder will be readily noticed, and illustrates the necessity for judgment in selecting percolators. If a fluid extract from the drug is to be made, the tall percolator, Fig. 317, should be chosen; if a strong tincture, Fig. 318 indicates the shape; whilst for a weak tincture, the funnel shown in Fig. 319 would be preferred; it being

understood that in each case the drug chosen is not an exceptionally difficult one to percolate.

The Degree of Comminution proper for each Substance must depend upon the physical structure of the drug, the ease with which the menstruum dissolves the active or desirable constituents, the length

FIG. 317.

of time required to exhaust the powder, and the relative proportion of menstruum to drug. *Nux vomica* and *ignatia* are drugs having a tough, horny structure, in which the soluble constituents are embedded. If these drugs are to be quickly exhausted of their soluble principles, they must be in fine powder. On the other hand, *gentian* and *rhubarb* are drugs which part easily with their active constituents, because their structure is loose and quickly penetrated by the menstruum: therefore these may be readily exhausted when in coarse powder. The relative proportion of menstruum to drug also has a bearing in determining the fineness of the powder, for it is clear that if a fluid extract is to be made in which one hundred volumes shall represent *one hundred* parts by weight of the drug, the powder should be a finer one than would be required for a tincture where one hundred volumes are used to exhaust *ten* parts by weight of the drug. In all cases, whether coarse or fine powder is directed, the powder should be *uniformly divided*; and where the degree of fineness is specified, but a small proportion of the powder should be capable of passing through a sieve of the next higher grade of fineness, and this small proportion should be thoroughly distributed through the powder. The object of this is to permit the uniform descent of the liquid, for fine particles offer more resistance to the passage of the menstruum than coarse ones; and if the powder is not uniform, and the finer particles are deposited upon one side of the percolator, imperfect exhaustion may occur, through the passage of the greater portion of the menstruum upon the side of least resistance,—*i.e.*, through the coarser particles. After the powdered drug is moistened, it should be passed through a riddle or coarse sieve several times,

to render it uniform. The little sifter shown in Fig. 218 has been found very efficient for this purpose.

Moistening of the Powder.—The general rule in percolation is to moisten the powder, and there are very few instances in the official processes where it is not directed. The object of moistening the powder is very apparent. If a perfectly dry sponge is held in the hand and a gentle stream of water poured upon it, it will be noticed that very little water is absorbed by it; but if the sponge is thoroughly soaked, and all the water squeezed out that possibly can be, it will be found that it will greedily absorb water. Most drugs are vegetable substances which in their natural state were moist. The process of desiccation has hardened and dried the tissues, so that, like the sponge, they do not absorb moisture quickly, and when compressed, as they are when packed in a percolator, the resistance is still greater. If a dry powder, like ground orange-peel, is tightly packed in a glass percolator and water poured upon it, it will be noticed that the water will penetrate the powder but a short distance. Its further passage is prevented by the particles which are immediately in contact with the water, which have become swollen to such a degree that they press tightly against the sides of the percolator, and thus entirely overcome the gravitating force and penetrating power of the water. If, on the other hand, the powdered orange-peel is moistened *with sufficient water to satisfy its tendency to swell, before it is packed* in the percolator, the addition of water is followed by its slow percolation through the mass without stoppage, and the utility of moistening the powder is thus proved.

The special cases in which the powder should not be moistened are those in which the addition of menstruum would produce adhesiveness and cause the powder to form lumps that could not be easily penetrated, those in which the moistened powder would offer too little resistance to the passage of the menstruum, and those in which the menstruum is too volatile or too inflammable to render moistening desirable or safe. An instance of the first case is found in the so-called cold percolation of sugar in making syrups; instances of the second and third cases, in the preparation of the oleoresins where ether is used as the menstruum.

Packing the Powder.—The official directions with regard to this important part of the process of percolation vary continually. Where the degree of pressure is immaterial, no special directions are given. Where there is a likelihood of too much pressure being exerted, so that percolation would cease before it should, the directions are, "pack it moderately;" on the other hand, if there is danger of the operator allowing the menstruum to pass through too rapidly, so that the drug would not be exhausted of its activity, the directions are, "pack it firmly." The proper degree of pressure can be judged only from the character of the drug and the nature of the menstruum. If a porous, spongy drug is to be percolated with a menstruum largely aqueous, it must be moderately packed; but if the menstruum is alcoholic, it must be firmly packed. Before beginning to pack the powder, the throat of the funnel or of the percolator must be obstructed by a loose plug of absorbent cotton or a deeply-notched cork (see Fig. 320), or by some

other method. The manner of inserting this obstruction is not very material. The cotton, however, should be dry and loosely inserted, and the cork either dry or moistened with the menstruum, care being taken not to moisten the cotton or cork with water unless the menstruum is aqueous, because if the drug to be percolated is resinous, the first portions of percolate which come through will be precipitated by the water in the cotton or on the cork. Instances have occurred where the percolation has been stopped from this cause. The direction of the Pharmacopœia to pour a small layer of sand upon the top of the cotton, to keep it in place, is, in our opinion, unnecessary. Where the notched cork is used, it is well to place over the top of the cork, when it is in place, a small circle of scored filtering-paper (see Fig. 321). This is slightly larger in diameter than the cork, and the edges are therefore reflected up the sides. A small quantity of the moistened powder will keep the cotton or the filtering-paper and cork in place just as well as the sand.

The moistened powder should be carefully deposited in the percolator in layers, each succeeding layer being packed according to the directions, "moderately" or "firmly," as the case may be, care being taken to use the same degree of pressure with each layer.

Imperfect packing.

Proper packing.

FIG. 320.

Notched cork.

FIG. 321.

Scored paper.

FIG. 322.

Packer.

Fig. 322 shows a convenient utensil for packing a percolator. It should be made of hard wood, preferably *lignum-vitæ*. The skill used in this part of the process will be proved by the manner in which the menstruum permeates the moistened powder. If the descent is regular and uniform, it is shown in a glass percolator by the line marking the descent of the menstruum being perfectly horizontal. If the line is irregular, it is easy to point out just where the pressure was insufficient or too great. Fig. 323 shows loose and irregular packing, too much pressure being made on the right side, the menstruum descending upon the left side unequally and escaping unsaturated. Fig. 324 illustrates a percolator which has been properly packed, the liquid descending uniformly.

Adding the Menstruum.—When the last portion of moistened powder is introduced into the percolator, a sheet of filtering-paper,

scored at the edges and slightly larger in diameter than the surface of the powder, should be laid upon it, for the purpose of causing the even distribution of the menstruum. A weight of some kind is usually placed upon the paper, to keep it from floating out of place. Clean pebbles, a bottle-stopper, or a glass funnel may be used, but in Fig. 325 is shown a glass tripod percolating weight, which has been made for this purpose by Whitall, Tatum & Co. It is easily cleaned, is not readily broken, and does not take up much room. Where the percolator is large enough to hold the whole of the menstruum, it may be at once added carefully. When this is not the case, and the menstruum must be added in divided portions, care must be observed to follow with the succeeding portion before the first has entirely disappeared, or otherwise fissures may appear in the powder, and the menstruum will of course then seek the outlet offering the least obstruction, and will leak through the fissures instead of percolating through the powder. This is more apt to occur in percolating very fine powders than in percolating coarse ones, although liable to take place in either. Where a large quantity of menstruum is required, a contrivance for continually supplying the menstruum should be used, in the form of an inverted bottle or flask (see Fig. 329), or any of the methods for continuous filtration (see Figs. 228 and 229) may be employed.

Previous Maceration is recommended when the structure of the powder is tough, when the soluble principles are not easily extracted by the menstruum, or when a comparatively large quantity of powder is to be exhausted by a small quantity of menstruum. It is obvious that maceration is going on constantly whilst the menstruum is traversing the powder during its gradual descent, and when the amount of menstruum is more than sufficient to exhaust the drug, previous maceration is merely a waste of time. Nevertheless, the framers of the Pharmacopœia, in order to prevent the possibility of an unskilful or ignorant operator's failing to exhaust a drug with the quantity of menstruum directed, have adopted in most cases the precaution of ordering previous maceration for a short time. This is best performed by moistening the drug, introducing it loosely into the percolator, and covering it closely to prevent loss by evaporation. This course has the additional advantage of allowing the drug to swell at the same time. A cover made of sheet-rubber (see Fig. 326), with a circular opening, is very useful in this connection. No attempt should ever be made to produce fluid extracts on the small scale without previous maceration.

Finishing the Process.—The official directions are frequently

FIG. 325.

Percolating weight.

FIG. 326.

Sheet-rubber cover.

definite in fixing the quantity of percolate to be received from a given quantity of powder, but the oft-repeated direction to "add the menstruum until the substance is exhausted" at once raises the question, When is a drug exhausted of its activity? This question can be properly answered only by knowing beforehand what the active principles of the drug are. A few examples will sufficiently illustrate this. The activity of nux vomica, opium, and cinchona resides in the bitter alkaloids: hence the *absence of bitterness* in the percolate in such cases indicates exhaustion. Cochineal and saffron are valued in pharmacy for nothing but the coloring-matter contained in them: hence the *absence of color* in the percolate indicates exhaustion. Catechu, galls, kino, krameria, etc., contain tannin, and this is the only valuable principle: the *absence of astringency* in the percolate in these cases, therefore, indicates exhaustion. The exhaustion of resinous drugs may be known by the absence of precipitation when the percolate is dropped into water. Where two or more active principles exist in a drug, the latter is not exhausted until the percolate is free from all of them. *The intelligent practice of the process of percolation, therefore, requires an accurate knowledge of the constituents and physical properties of medicinal substances.*

Choice of Menstrua.—Much labor has been bestowed by investigators in ascertaining the exact proportions of the usual solvents—water, alcohol, glycerin, etc.—that are best adapted for depriving drugs of such of their soluble principles as are desirable, and at the same time leaving untouched in the residue those principles which are either inert or objectionable. The special menstruum which is exactly adapted to the peculiar characteristics of the drug, and which will cause the retention of the soluble principles in a permanent form under the varying conditions of climate, and at the same time permit exposure to light, heat, and air without injury, can be determined only by experiment and experience. When new galenical preparations are proposed, the menstruum selected must therefore be merely tentative, and general principles must guide, until positive knowledge is secured. Alcohol would be indicated for active resinous drugs, diluted alcohol for simple bitter tonics, cathartics, etc., and diluted alcohol with glycerin for astringent drugs, etc. The selection of proper menstrua will be noticed, as occasion demands, in the chapters upon infusions, tinctures, extracts, fluid extracts, etc.

Absorbed Menstruum.—The amount of menstruum which a powder will absorb and retain after percolation ceases can never be accurately predetermined. If it is important to know beforehand the percentage of menstruum capable of being absorbed, a practical trial should be made upon the small scale, using the same powder and menstruum.

Substances possess very different capacities for retaining menstruum: those having a light, spongy structure hold more than hard ligneous drugs, and even the same drug will often vary in its capacity in this respect, whilst the amount of moisture present in the drug before it is percolated is never a constant quantity, varying sometimes as much as eight to twenty per cent. The advantages of percolation over maceration are very apparent in respect to the character of the liquid left in the residue: in maceration the liquid left in the residue is finished tincture; in per-

colation it is merely menstruum, the active portions of the drug having been dissolved in the preceding percolate. In large operations, from an economical point of view, it is desirable to recover absorbed menstrua when the residues contain sufficient alcohol to make it worth the necessary time and labor. Distillation is then resorted to, or the residue is treated with weak alcohol and subsequently with water. Where water causes swelling of the substance and a stoppage of the percolation, the residue may be mixed with clean sawdust, rice chaff, or other inert dry substance, and then percolated with water. Recovered distilled alcohol may be purified by treating it with potassium permanganate; twelve grains dissolved in a gallon of the percolate, and allowed to stand a few days, are usually sufficient: the purified alcohol may be decanted or filtered. Care must always be taken not to use unpurified recovered alcohol which is odorous on account of containing volatile oil obtained from a drug, or which may be otherwise impure.

Controlling the Flow of the Percolate.—The necessity for some method of controlling the flow of the percolate is apparent. In simple percolation this is effected by the degree of pressure used in packing the moistened drug, as has been previously explained. Judgment and experience are absolutely necessary to guide the operator. Various mechanical expedients have been used to accomplish the same purpose. In official percolation (see Fig. 313) the flow of the percolate is regulated by increasing or decreasing the difference in height between the end of the rubber delivery-tube and the height of the liquid in the percolator. In metallic percolators stop-cocks have been employed, but, owing to the difficulty of thoroughly cleaning them, their use has been almost entirely abandoned. In the following descriptions of special percolators it will be observed that the control of the flow of the percolate is one of the principal objects sought.

SPECIAL PERCOLATORS.

Stoppered Percolator.—Many modifications in the ordinary cylindrical or conical percolator have been suggested from time to time to suit special requirements. In Fig. 327 is shown a glass percolator proposed by Dursse, the special merit of which lies in the manner in which evaporation is prevented. This is effected by means of the ground-glass cover: the upper part of the percolator, R, is strengthened by a deep band; the glass cover, C, is carefully ground so as accurately to fit the percolator and make a nearly tight joint, which can be improved by moistening the edge with glycerin. If the percolate should flow too freely, it can generally be checked by screwing in the cover of the percolator; should it flow too slowly, a small piece of twine inserted between the cover and the side will permit the necessary pressure of the atmosphere. The graceful outlines of this percolator, and the evident care used in its manufacture, may be mentioned as points in its favor.

Well-tube Percolator.—An excellent method of percolation which has been used by Dr. E. R. Squibb for a number of years, and is still employed, is shown in Fig. 328. It is based upon the principle of drawing water from a well automatically as fast as it accumulates. This

is effected by the use of a well-tube placed in the centre of an ordinary jar or pot and held in its place by the powdered drug which is packed around it. The menstruum is poured upon the drug, and, after percolating through, collects in the well-tube, from which

FIG. 327.

Durnee's percolator.

it is drawn off by an ingeniously-constructed syphon. The practical value of this method warrants a detailed description. It may be used for either large or small operations.

The percolator is a stone-ware pot of about two gallons' capacity, capable of holding six pounds of most drugs, and mounted on a suitable stand. A disk of blanket, *b*, is cut of such a size and shape as to lie flat upon the bottom and cover it entirely. Another disk, *c*, of the same material, but a little larger, is made with a crucial incision (X) in the centre, so that it may be stretched over the end of the well-tube, *e*. This is a piece of glass tube about twelve inches long, having an internal diameter of half an inch, and irregularly notched or gnawed off obliquely at the lower end. One end of this well-tube is pushed through the crucial cut in the centre of the upper disk of blanket, and this blanket is pushed to the other end of the tube, so that the corners made by the crucial cut are reflected up against the outside of the tube. These corners are then tied firmly to the tube by passing twine around them, or are secured by a stout rubber band, *g*, made of a section of rubber tubing of proper

size. A disk of filtering-paper, *d*, larger than the upper blanket, *c*, with a crucial cut in the centre, and scored round the edge so as to lie flat against the sides of the percolator where reflected up against them, is pushed down upon the upper blanket, the well-tube passing through the cut in the centre. If now a cork be temporarily stuck into the well-tube to keep out the moistened powder, the percolator is ready to receive its charge, which is packed around the well-tube and upon the disks of paper and blanket so as to occupy the main body of the percolator, *h*, up to about the position of *i*. When the charge, having been properly moistened, rubbed, and sifted, so as to be entirely uniform and free from wet lumps, is packed around the well-tube loosely or firmly according to the nature of the substance and the menstruum, its surface is covered by a disk of muslin or paper, *i*, cut so as to lie flat and smoothly upon the surface. The object of this is to distribute the menstruum as it is poured on, and to prevent the stream from breaking up and deranging the surface. Should this paper disk show a tendency to float in the stratum of menstruum, it may be held down by a few fragments of glass. The percolator is then ready to receive the menstruum or weak percolate, and a stratum of the liquid should be carefully kept covering the entire surface until the whole mass of the substance to be percolated is saturated. The cork is to be taken from the well-tube before the liquid is poured on, and then the liquid will flow down into the substance like a piston, pushing the interstitial

air before it, the air passing out through the blankets and the well-tube; finally the liquid will rise in the well-tube until its surface is within an inch or so of the surface of the liquid outside.

The whole substance is now in a perfect condition for maceration, and the surface should be left covered with the liquid to the depth of at least half an inch. A short section of rather thick rubber tubing, *o*, should be stretched over the upper end of the well-tube, and slipped down so as to support the centre of the cover. A tightly-fitting cover, *j*, made

FIG. 328.

Well-tube percolator (Squibb).

of sheet-rubber a quarter of an inch thick, with a hole in the centre for the well-tube, is then put on. The syphon, *f*, is made of glass tubing of about an eighth of an inch bore, bent twice at right angles, the two legs being each about twelve inches long. The outer leg is a little longer than the inner one, and turned up upon itself for about three-quarters of an inch, as shown in Fig. 328. The legs should have only such a difference in length that the inner one will reach the bottom

of the well-tube when required, and when measured upon the outer one will reach to about midway of its turned-up end.

This construction prevents the syphon from emptying itself at any time, for when the liquid is drawn over by the syphon until the surface of liquid in the well-tube falls to a level with the end of the turned-up portion, as shown by the lines in Fig. 328, the columns of liquid in the syphon will be of equal length and will counterbalance each other, and the flow will cease without emptying the syphon. But as soon as the level of the liquid in the well is raised by fresh additions of menstruum on the substance, the flow will recommence at a rate proportionate to the difference of levels, and may be readjusted to the required rate by slipping the syphon up or down in the cork, *k*, in the upper end of the well-tube. This cork should be bored to fit the syphon so tightly as to hold it in any position, and should have a groove filed longitudinally on its outer side, to allow free exit of air.

If it is desirable at any stage in the percolation to stop the process, the syphon may be gently lifted until the leg in the well-tube is above the level of the percolate there, when the flow will cease. It may be started by simply pushing the leg down into the tube again: this is a practical convenience which is greatly appreciated. If the syphon should accidentally empty itself, the flow is easily started by attaching a short rubber tube to the curved end and applying suction.

Double-tube Percolator.—This differs from the well-tube percolator just described in the use of an ordinary percolator, the absence of the syphon, and the substitution of a simple, straight tube which is free to move up or down inside of the well-tube at the discretion of the operator. Fig. 329 illustrates its mode of action. A central well-tube having the lower end irregularly broken is placed in an ordinary glass percolator, upon a tuft of absorbent cotton, or, as in Dr. Squibb's percolator, a circular piece of muslin is securely tied upon the tube a short distance from the bottom, as shown in the small cut in Fig. 329, and the end of the tube rests upon a perforated cork fitting tightly in the neck of the percolator, as proposed by W. S. Thomson in his description of a similar apparatus. The control of the flow of the percolate is effected by raising or lowering the small tube which passes into the well-tube, and which is held in place by passing through the perforated cork in the neck of the percolator already mentioned, or through a perforated rubber nipple slipped over the end, as suggested by Windolph, or through a piece of rubber tubing. If previous maceration is directed, the narrow tube may be pushed up until the upper orifice is above the level of the menstruum, and of course above the level of the percolate in the well-tube. When it is desirable to begin percolating, the tube is gently rotated with a downward movement until the level of the percolate is reached, and then percolation proceeds regularly, the course of the menstruum being indicated by the arrows in Fig. 329. The rapidity of the flow is increased by lowering the tube, and decreased by raising it.

Suspended Percolator.—In large operations it is necessary to employ means to facilitate not only the percolation, but also the packing and emptying and other subordinate but essential parts of the process. Fig. 330 shows a percolator in use by Hance Brothers & White. The

large percolator of tinned copper is suspended by trunnions, T, which are fastened to a stout band encircling the percolator slightly above the centre; two steam-pipe supports are secured to a strong beam, B, above, and the trunnions rest in tees, which are screwed to the end of the

FIG. 329.

Double-tube percolator.

pipe-supports: the sliding tee, G, is dropped into the cup-shaped catch, A, when it is desired to retain the percolator in an upright position. The special advantage in this arrangement is observed, however, when an operation is concluded: a residue-car may then be wheeled opposite to the percolator, and the tee pushed up so as to permit the percolator to swing on the trunnions: the percolator may then be turned upside down

FIG. 330.

Suspended percolator (Hance's).

with the greatest ease, its conical shape facilitating the discharge of the residue.

Pressure Percolators.—Within a few years percolation by pressure

has come into vogue in various parts of the country, and there are at the present time several forms of pressure percolators upon the market; each one differing somewhat from the others in detail, but all based upon the same principle,—that of forcing the menstruum through the powder at a greater rate of speed than it would pass if it depended alone on the force of gravity.

The pressure is usually exerted through a column of menstruum entering the percolator at the top, the menstruum being supplied and the column sustained from a reservoir of the liquid suspended above it at a height of from three to ten feet. It will be noticed that Count Real's apparatus, invented in 1815, was based upon this principle (see page 263), and since then Stearns, Rosenwasser, Berry, Suits, Anderson, and others have advocated or introduced apparatus under various names by which percolation is carried on under pressure. It must suffice in this place to describe briefly one of the newer pressure percolators, that of Suits, full and detailed information being readily obtained from the manufacturers of any of them. Fig. 331 shows one of the best forms, the glass percolator B, protected by three iron bands, having at the top a tight cover made of plated sheet copper, having two stop-cocks; the cover is made air-tight by being clamped between two flat sheet-rubber rings; the bottom of the percolator has a stop-cock cemented in it; the moistened powder, F, is kept in place and some pressure exerted by means of the porous metal diaphragm, the spring E, and the metal tube C which passes through an air-tight joint in the top. The tripod, G, is not used during the percolation, but is useful in supporting the percolator whilst packing. It is possible with this apparatus to macerate the powder under pressure, and at the end, after all of the menstruum has been run into the percolator and hydrostatic pressure is no longer available, a convenient rubber bulb air-pump may be used to force air into the percolator to maintain the pressure. This apparatus may be used to great advantage in filtering oils under pressure, or as a bottle-filler. After an extended practical trial of percolation by pressure, the author has reached the conclusion, that, whilst there are some percolating operations in which it can be used with advantage, for the great majority the pressure is unnecessary, just as perfect results being reached by the use of as simple a percolator as a glass funnel or cylinder of the well-known form.

Methods of Supporting Percolators.—The ordinary retort-stands

FIG. 331.

Pressure percolator.

are often used to support percolators, but these are generally flimsy and unsatisfactory. The one shown in Fig. 164, particularly if used with split rubber-tube sections, as seen in Fig. 167, is much to be preferred. The stand shown in Fig. 332 was devised by the author in 1875, and has been in constant use since. It is conveniently fastened to the wall

FIG. 332.

Percolation stand.

in front of the working counter. Two long strips having slots down the centre are supported on brackets, and short cross-strips having their inside edges hollowed out are fastened to the long strips by thumb-screws. This arrangement permits the adjustment of the cross-strips so that either a large or a small percolator or funnel can be supported, as shown in the cut, at any desired height. This stand is capable of enlargement by means of additional brackets and strips. If a wall counter is not available, a frame may be made extending over an ordinary counter, which will serve as well for a support, care being taken that the strips and frame are heavy enough to bear without strain any weight likely to be placed upon the stand. The special advantage of a percolating stand is, that it enables all percolating and filtering operations to be carried on with convenience in one place, thus saving time and labor.

Percolation Closet.—The retort-rings shown in Fig. 164 have been used by James T. Shinn in a convenient percolation closet, shown in Fig. 333. Two lengths of ordinary five-eighths-inch iron steam-pipe are fastened securely to the top and bottom of the closet, at a convenient distance from the shelves. The retort-rings may be adjusted to the desired height, and it is thus possible to carry on several percola-

tions or filtrations at the same time, away from the other operations of the shop, in a closet with a closed door.

Receiving Bottles.—A series of bottles of various sizes should be reserved for use in receiving percolates. Where especial accuracy is necessary, a flask with a double mark on the neck should be used (see Fig. 334). Bottles with comparatively wide necks are to be preferred for receiving bottles. A paper strip may be pasted on the side, and accurately measured quantities of water poured in, carefully marking the height of each addition; upon the opposite side corresponding metric quantities may also be placed (see Fig. 335). J. M. Maris & Co. furnish narrow receiving bottles (metric and old form, and both systems on the same bottle) (Fig. 336). The graduations are accurately engraved on the glass, and arranged, at the author's suggestion, to suit the quantities of the U. S. P. 1890. These, unlike the home-made receivers, are permanently marked and of elegant appearance.

Repercolation, as its name indicates, is the process of percolating substances with percolates, or, as defined by Dr. E. R. Squibb, the

author of the process, "the successive application of the same percolating menstruum to fresh portions of the substance to be percolated." The principal object of repercolation is to effect the saving of alcohol and alcoholic menstrea by accomplishing the saturation of the menstrea, as nearly as possible, by passing the unsaturated or weaker percolate from one portion of the drug through another portion, and again passing the unsaturated or weaker percolate from this second portion through a third portion. The weak percolate from this last portion is generally set aside, to be used in succeeding operations upon the same drug in the place of fresh menstruum. This process is useful only in those operations where the relative proportion of menstruum used is small, as in the fluid extracts and similar concentrated preparations. Practical illustrations of the use of this process may be seen under Fluid Extracts.

Fractional Percolation is the term employed by Prof. C. Lewis Diehl and others to define percolation when applied to two successive portions of powder, the principle of action being identical with that of repercolation.

QUESTIONS ON CHAPTER XX.

PERCOLATION.

What is percolation or displacement?

What is lixiviation?

To whom belongs the credit of first demonstrating the value of the process of percolation in its pharmaceutical applications?

What is the principle of action in displacement?

What is the instrument used to hold the powder called?

What is the liquid poured on the top of the powder called?

What is the liquid which passes through the powder called?

According to directions given in the U. S. Pharmacopœia, in what does the process of percolation consist?

When the process is successfully conducted, how will the first portion of the percolate compare with the succeeding portions as regards color, odor, etc.?

What shape or shapes are most suitable for percolating such quantities as are directed by the U. S. P.?

Of what material may it best be constructed?

Give the directions for preparing and putting into the percolator a powder for percolation.

Give directions for pouring on the menstruum and starting the percolation.

How may the flow of the percolate be regulated so as to run with greater or less rapidity?

How may a layer of menstruum be kept constantly above the powder, and why is this desirable?

In what cases may narrow percolators be advantageously used, and in what cases wide ones?

Why is a narrow percolator preferable for making fluid extracts?

Upon what depends the proper degree of comminution for a substance to be subjected to percolation?

What happens when a powder of unequal degrees of fineness is subjected to percolation?

What is the object of moistening a powder before subjecting it to percolation?

In what special cases should the substance not be moistened?

What is the object of the directions in the U. S. P. given for packing powders in percolation, such as "pack it moderately," "pack it firmly," etc.?

In packing a percolator or funnel, how is the powder prevented from running through?

How should a powder be packed in a percolator so as to insure its being packed uniformly?

After adding a portion of menstruum to a powder in a percolator, should the surface be allowed to become dry, or should the supply of menstruum be continuous? Why?

Is maceration previous to percolation desirable? Why?

In the process of percolation the direction is often given, "add the menstruum until the substance is exhausted." How may it be known when a drug is exhausted? Give examples.

In the choice of menstruums, in what cases would alcohol be indicated? In what cases diluted alcohol?

Where would the addition of glycerin be advisable?

What advantage has percolation or maceration as regards the absorbed liquid left in the residue?

How can alcohol absorbed in residues be recovered?

How can the alcohol so recovered be purified?

Describe Dursse's percolator, Dr. Squibb's well-tube percolator, the double-tube percolator.

What is the object of having a percolator suspended on trunnions?

Describe percolation by pressure.

How are percolators ordinarily supported?

What is the objection to the ordinary retort-stands?

Describe a percolating stand that would be more satisfactory.

What is the advantage of a percolating closet.

How may receiving bottles be conveniently marked?

What is repercolation?

What is its principal object?

In what operations is repercolation useful?

What is fractional percolation?

PART II.

OFFICIAL PHARMACY.

THE various processes which are used in making the official preparations having been considered in Part I., as solution, filtration, digestion, percolation, maceration, expression, etc., it is most appropriate now to take up these preparations and classify them. Those which form natural groups will be brought together in such a manner as to facilitate the study of their general features. Each chapter will begin with a definition and description of the class of preparations treated of; then will follow a table giving a succinct view of the individual preparations forming the class; and after this, the official processes will be found arranged alphabetically. Detailed comments upon the preparations are reserved for the subsequent chapters, the object being at this time to familiarize the student with the *various forms* of official preparations and fix their general characteristics upon the mind. The following diagram will serve to give a complete view of the classification: it should be carefully examined at the outset, and referred to again after the classes have been studied in detail.

OFFICIAL PREPARATIONS.¹

LIQUIDS.		SOLIDS.	
Made without percolation or maceration.	Made by percolation or maceration.	Made by percolation or maceration.	Made without percolation or maceration. ²
Aqueous Solutions.	Aqueous Liquids.	Extracts.	Powders.
Waters.	Infusions.	Resins.	Triturations.
Solutions.	Decoctions.		Masses.
Aqueous Solutions containing Sweet or Viscid Substances.	Alcoholic Liquids.		Confections.
Syrups.	Tinctures.		Pills.
Honey.	Wines.		Troches.
Mucilages.	Fluid Extracts.		Cerates.
Emulsions.	Ethereal Liquids.		Ointments.
Mixtures.	Oleoresins.		Plasters.
Glycerites.	Acetous Liquids.		Papers.
Alcoholic Solutions.	Vinegars.		Suppositories.
Spirits.			
Elixirs.			
Ethereal Solutions.			
Collodions.			
Oleaginous Solutions.			
Liniments.			
Oleates.			

¹ Those used internally are in Roman type; those used externally, in Italics.

² The preparations in this class are mostly extemporaneous, and will be considered under Part V.

CHAPTER XXI.

AQUEOUS SOLUTIONS.

Aqua. Waters.

THE class of preparations termed *waters* are known also as medicated, aromatic, or distilled waters, and may be simply defined as *aqueous solutions of volatile substances*. The German Pharmacopœia and French Codex, however, recognize as waters solutions of non-volatile substances. The volatile substances used in the preparation of waters are either solid, liquid, or gaseous, and the following methods have been employed in effecting their solution: 1. Simple solution in cold water. 2. Solution in hot water. 3. Filtration through an absorbent powder. 4. Percolation through cotton saturated with the substance. 5. Distillation.

Most of the medicated waters are used as pleasant vehicles and solvents for the administration of various remedies, and are solutions of aromatic volatile oils. There are *eighteen* official waters, excluding ordinary water.

1. Simple Solution in Cold Water.—This method is resorted to when the proportion of the volatile substance is small enough to dissolve *easily* in the quantity of water required. The process where a volatile liquid is the medicating substance is, to agitate it with the water until dissolved, and then to filter the solution. In the case of the gaseous solutions, the gas is passed through the water until a solution of the desired strength is obtained. (See Solution of Gases, p. 205.) Of the eighteen official waters, three are distilled, four are solutions of gases, six are solutions of volatile oils, two are diluted distilled waters, one is a solution of a volatile solid, and two are solutions of volatile liquids.

Official Waters made by Simple Solution.

Name.	Proportion of Liquid dissolved.	Uses and Dose.
Aqua Amygdalæ Amaræ.	0.1 per cent. of Oil of Bitter Almond.	Pleasantly flavored vehicle, ℥ij.
Aqua Creosoti.	1 per cent. of Creosote.	Antiseptic and used locally, ℥i to ℥iv.
Aqua Chloroformi.	Saturated solution.	Sedative and vehicle.

Official Waters made by passing Gases through Water.

Name.	Proportion of Gas dissolved.	Uses.
Aqua Ammoniæ.	10 per cent. of gaseous Ammonia.	Stimulant, caustic.
Aqua Ammoniæ Fortior.	28 per cent. of gaseous Ammonia.	Rubefacient, escharotic.
Aqua Chlorig.	0.4 per cent. of gaseous Chlorine.	Antiseptic, stimulant.
Aqua Hydrogenii Dioxid.	3 per cent. of pure Dioxide.	Antiseptic.

2. Solution in Hot Water.—This method is founded upon the fact that most of the volatile oils are much more soluble in hot water than in water of ordinary temperature: hence, if the volatile oil is thoroughly agitated with hot water in a metallic vessel, such as a tin can or a bottle, and allowed to stand until the excess has separated, if care is used, the water will be found to be saturated: it may then be decanted and filtered.

3. Filtration through an Absorbent Powder is the process which has been most frequently employed: the object of using the powder is to divide thoroughly the oil, or volatile liquid, and expose a greater surface, so that the water in filtering through it may become completely saturated. The powder most frequently used is magnesium carbonate, but this is sometimes objectionable on account of being slightly soluble in water. Calcium phosphate, kaolin, powdered glass, silica, powdered pumice-stone, charcoal, paper pulp, precipitated chalk, sugar, etc., have been suggested as substitutes, but there are quite as forcible objections to be urged against these as against the magnesium carbonate. Where solutions of alkaloids or of silver nitrate are needed, distilled water alone should be used. The present official method directs the use of precipitated calcium phosphate, but purified magnesium carbonate is preferable.

4. Percolation through Cotton impregnated with the Substance.—This was the process directed to be used in the U. S. P. 1880; it was abandoned in the revision of 1890 on account of its inconvenience and wastefulness. The oil or volatile liquid is distributed upon the fibres of cotton, which are then pulled apart in order to secure thorough division; the saturated cotton is packed in a funnel, and the water poured upon it. In its passage downward the water dissolves the oil and passes out impregnated with the odorous substance. The presence of undissolved floating oily drops in the finished preparation has constituted one of the greatest objections to this process. It is an improvement to insert a plug of dry cotton in the throat of the funnel before placing the saturated cotton in position: this prevents the oily drops which may escape solution from being carried down by the water as it percolates through. Too much care cannot be exercised in selecting the volatile oils, which should be fresh and of the best quality.

Official Waters made by Filtration through an Absorbent Powder.

Name.	Proportion.	Use and Dose.
Aqua Anisi.	0.2 per cent. of Oil of Anise.	Pleasant vehicle, ℥i.
Aqua Camphoræ.	0.8 per cent. of Camphor dissolved in Alcohol.	Mild antispasmodic, ℥ss.
Aqua Cinnamomi.	0.2 per cent. of Oil of Cinnamon.	Pleasant vehicle, ℥i.
Aqua Fœniculi.	0.2 per cent. of Oil of Fennel.	Pleasant vehicle, ℥i.
Aqua Menthæ Piperitæ.	0.2 per cent. of Oil of Peppermint.	Pleasant vehicle, ℥i.
Aqua Menthæ Viridis.	0.2 per cent. of Oil of Spearmint.	Pleasant vehicle, ℥i.

5. **Distillation.**—This is the best process for preparing medicated waters, and should be used wherever practicable. If the fresh drug can be procured, it should always be used in preference to that which has been dried, because in the process of desiccation there is usually a loss of the agreeable volatile constituents. Metallic distillatory apparatus is preferably employed (see page 166). If the drug containing the oil-cells has a loose structure and is quickly penetrated by hot water, so that the oil-cells are easily ruptured, the drug may be introduced without previous contusion or grinding: it will usually be found, however, most economical to cut or grind the drug coarsely. Most distilled waters acquire an unpleasant empyreumatic odor as soon as they are distilled; this passes off gradually upon exposure to air, if care has been taken not to expose the drug to the action of direct heat during distillation. If no precautions are taken to protect the drug from partial burning, the odor of the carbonized substance will always be noticeable in the distilled water, rendering the product worthless. Fig. 182 shows a copper wire cage contrived by the author to obviate the difficulty just described: the surface of the cage is hemispherical; it rests, after being partially filled with the drug, upon the flat bottom of the still, and thus the contact of the substance with the heated surface is avoided: the meshes of the cage are coarse enough to permit the free passage of vapors and the boiling water through them. Although distillation by the use of steam may be most convenient upon the large scale, Vuafart and Machet have shown that rose and orange-flower waters distilled over a naked fire keep better than those distilled by steam heat.

Preservation.—Distilled waters should not be made in larger quantities than can be used within a reasonable time, because they deteriorate when long kept, a flocculent precipitate forming in them, and ultimately they lose all traces of their usually agreeable odor. Microscopic plants belonging to the order *Confervoidæ* will often be found in medicated waters. These are usually tufts of articulated filaments, propagated by very minute spores from the atmosphere which have found lodgment in the water. Their presence renders the medicated water unsightly, and when in large proportion they must be regarded as injurious. If the aromatic water is heated and introduced into a bottle with a side opening near the bottom (like a douche-bottle) to which a rubber tube with a pinch-cock is attached, and a tuft of cotton pushed into the *neck* of the bottle, any spores originally present in the water will be killed by the heat, and the future growth of *confervæ* will be prevented by the interception of the spores by the cotton. It usually suffices, however, to heat the medicated water and introduce it at once into small bottles, which are to be completely filled, tightly sealed, and kept in a cool, dark place. Alcohol is sometimes added as a preservative, but this generally serves its purpose only a short time, as it cannot be added in sufficient quantity to preserve the water permanently, on account of its interference with the therapeutic action. The small percentage of alcohol in the medicated water is converted into acetic acid when long kept, and thus the preparation is soured. Glycerin and syrup have been suggested as preservatives. In the writer's experience they are not of much value unless used in large and inadmissible quantities.

Official Waters made by Distillation.

Name.	Proportion of Material used.	Use and Dose.
Aqua Aurantii Florum Fortior.	Water saturated with Oil of Fresh Orange Flowers.	Used for making Orange Flower Water.
Aqua Aurantii Florum.	Stronger Orange Flower Water, Distilled Water, each, 1 vol.	Mild sedative vehicle, f $\overline{3}$ ss.
Aqua Destillata.	800 parts distilled from 1000 of water.	Solvent.
Aqua Rosæ Fortior.	Water saturated with Oil of Rose petals.	Used for making Rose Water.
Aqua Rosæ.	Stronger Rose Water, Distilled Water, each, 1 vol.	Pleasant vehicle, f $\overline{3}$ i.

PRACTICAL PROCESSES FOR OFFICIAL WATERS.

AQUA AMYGDALÆ AMARÆ. U. S. Bitter Almond Water.

	Metric.	Old form.
Oil of Bitter Almond	1 C.c.	15 minims.
Distilled Water	999 C.c.	2 pints.
To make	1000 C.c.	2 pints.

Dissolve the Oil in the Distilled Water by agitation, and filter through a well-wetted filter.

AQUA ANISI. U. S. Anise Water.

	Metric.	Old form.
Oil of Anise	2 C.c.	80 minims.
Precipitated Calcium Phosphate	4 Gm.	60 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Oil of Anise with the precipitated Calcium Phosphate, add the Water gradually, under constant trituration, and filter.

AQUA AURANTII FLORUM. U. S. Orange Flower Water.

	Old form.
Stronger Orange Flower Water,	
Distilled Water, of each, one volume	8 fl. oz.
	1 pint.

Mix them immediately before use.

AQUA AURANTII FLORUM FORTIOR. U. S. Stronger Orange Flower Water.

[AQUA AURANTII FLORUM, PHARM. 1880. TRIPLE ORANGE FLOWER WATER.]

Water saturated with the volatile oil of fresh Orange Flowers, obtained as a by-product in the distillation of the Oil of Orange Flowers. It should be kept in loosely-stoppered bottles, in a dark place.

Stronger Orange Flower Water should be neutral to litmus paper, and possess a strong odor of fresh orange flowers.

It should be colorless and clear, or only faintly opalescent, not mucilaginous, and give no reaction with hydrogen sulphide T.S. or ammonium sulphide T.S. (absence of metallic impurities).

AQUA CAMPHORÆ. U. S. Camphor Water.

	Metric.	Old form.
Camphor	8 Gm.	117 grains.
Alcohol	5 C.c.	78 minims.
Precipitated Calcium Phosphate	5 Gm.	78 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Camphor with the Alcohol and Precipitated Calcium Phosphate, then with the Water gradually added, and filter.

AQUA CHLORI. U. S. Chlorine Water.

An aqueous solution of Chlorine [$\text{Cl} = 85.37$], containing at least 0.4 per cent. of the gas.

	Metric.	Old form.
Manganese Dioxide	10 Gm.	146 grains.
Hydrochloric Acid	35 C.c.	9 fl. dr.
Water	75 C.c.	2 fl. oz. 3½ fl. dr.
Distilled Water	400 C.c.	12 fl. oz. 6½ fl. dr.

Place the Dioxide in a flask connected by a suitable tube with a small wash-bottle containing 50 C.c. [old form 1 fl. oz. 5 fl. dr.] of Water, and connect this with a bottle having a capacity of 1000 C.c. [old form 2 pints], and containing 400 C.c. [old form 12 fl. oz. 6½ fl. dr.] of Distilled Water which has previously been boiled and allowed to cool. Add to the Dioxide in the generating flask the Hydrochloric Acid, previously diluted with 25 C.c. [old form 6½ fl. dr.] of Water, and, by means of a sand-bath, apply a gentle heat. Conduct the generated Chlorine through the Water contained in the wash-bottle into the bottle containing the Distilled Water, which should be loosely stopped with cotton and kept, during the operation, at a temperature of about 10° C. (50° F.). When the air has been entirely displaced by the gas, disconnect the bottle from the apparatus, and, having inserted the stopper, shake the bottle, loosening the stopper from time to time, until the gas ceases to be absorbed. If necessary, reconnect the bottle with the apparatus, and continue passing the gas and agitating until the Distilled Water is saturated. Finally, pour the Chlorine Water into small, dark amber-colored, glass-stoppered bottles, which should be completely filled therewith, and keep them in a dark and cool place.

Chlorine Water, even when kept from light and air, is apt to deteriorate. When it is required of full strength, it should be freshly prepared.

A clear, greenish-yellow liquid, having the suffocating odor and disagreeable taste of Chlorine, and leaving no residue on evaporation.

It instantly decolorizes dilute solutions of litmus, indigo, and other vegetable coloring matters.

When shaken with an excess of mercury until the odor of Chlorine has disappeared, the remaining liquid should be at most but faintly acid (limit of *hydrochloric acid*).

On adding 17.7 Gm. of Chlorine Water to a solution of 1 Gm. of potassium iodide in 10 C.c. of water, the resulting deep-red liquid should require for complete decoloration not less than 20 C.c. of decinormal sodium hyposulphite V.S. (corresponding to at least 0.4 per cent. of Chlorine).

AQUA CHLOROFORMI. U.S. Chloroform Water.

Chloroform,

Distilled Water, each, a sufficient quantity.

Add enough Chloroform to a convenient quantity of Distilled Water, contained in a dark amber-colored bottle, to maintain a slight excess of the former, after the contents have been repeatedly and thoroughly agitated.

When Chloroform Water is required for use, pour off the needed quantity of the solution, refill the bottle with Distilled Water and saturate it by thorough agitation, taking care that there be always an excess of Chloroform present.

AQUA CINNAMOMI. U.S. Cinnamon Water.

	Metric.	Old form.
Oil of Cinnamon	2 C.c.	80 minims.
Precipitated Calcium Phosphate	4 Gm.	60 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Oil of Cinnamon with the Precipitated Calcium Phosphate, add the Distilled Water gradually, under continued trituration, and filter.

AQUA CREOSOTI. U.S. Creosote Water.

	Metric.	Old form.
Creosote	10 C.c.	154 minims.
Distilled Water	990 C.c.	81 fl. oz. 5½ fl. dr.
To make	1000 C.c.	2 pints.

Agitate the Creosote vigorously with the Distilled Water, and filter through a well-wetted filter.

AQUA DESTILLATA. U.S. Distilled Water.

$$\text{H}_2\text{O} = 17.96.$$

	Metric.	Old form.
Water	1000 Vol.	10 pints.
To make	800 Vol.	8 pints.

Distil the Water from a suitable apparatus provided with a block-tin or glass condenser. Collect the first 100 volumes [old form 2 pints], and throw this portion away. Then collect 800 volumes [old form 8 pints], and keep the Distilled Water in glass-stoppered bottles, rinsed with hot Distilled Water immediately before being filled.

AQUA FENICULI. U.S. Fennel Water.

	Metric.	Old form.
Oil of Fennel	2 C.c.	80 minims.
Precipitated Calcium Phosphate	4 Gm.	60 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Oil of Fennel with the Precipitated Calcium Phosphate, add the Distilled Water gradually, under continued trituration, and filter.

AQUA HYDROGENII DIOXIDI. U.S. Solution of Hydrogen Dioxide.**[SOLUTION OF HYDROGEN PEROXIDE.]**

A slightly acid, aqueous solution of Hydrogen Dioxide [$\text{H}_2\text{O}_2 = 88.92$], containing, when freshly prepared, about 8 per cent., by weight, of the pure Dioxide, corresponding to about 10 volumes of available oxygen.

	Metric.	Old form.
Barium Dioxide	300 Gm.	10 oz. av. 7 grains.
Phosphoric Acid,		
Diluted Sulphuric Acid,		
Distilled Water, each, a sufficient quantity.		

Pour 500 C.c. [old form 16 fl. oz.] of cold Distilled Water into a suitable bottle, add to it the Barium Dioxide in such a way that it shall not form lumps, and shake vigorously so that a uniform mixture may result. Provide suitable means of refrigeration, so that the bottle and contents may be kept at a temperature below 10°C . (50°F .), and shake it thoroughly every few minutes during half an hour. Afterwards, continuing the refrigeration, shake it occasionally, but vigorously, until the Dioxide has become fully hydrated, which may be recognized from the fact that only a small portion of the water separates from it on standing, and that it may be mixed with the separated water without great effort by shaking. Having introduced 96 C.c. [old form 3 fl. oz. 34 minims] of Phosphoric Acid into a bottle having the capacity of about 2000 C.c. [old form 4 pints], add to it 320 C.c. [old form 10 fl. oz. 115 minims] of Distilled Water, cool the mixture, and remove 50 C.c. [old form 1 fl. oz. 288 minims] as a reserved portion. Now add the well-mixed magma, in about four portions, to the acid liquid, and mix them intimately by vigorous and continuous shaking, cooling the bottle after each addition of magma. From time to time test the reaction of the liquid, and, when it becomes alkaline, add to it, cautiously, a little of the reserved Phosphoric Acid, until the liquid has again acquired an acid character. Repeat the agitation from time to time, and also the cautious addition of Phosphoric Acid, as long as the liquid becomes alkaline on prolonged, vigorous shaking. If necessary, a further quantity of Phosphoric Acid should be diluted with Distilled Water, in the proportion above given, and a portion of this liquid used for saturation. Having finally shaken the bottle again very thoroughly, and until the liquid part is neutral to litmus paper, set it aside until the precipitate occupies only about one-third

of the volume of the contents, and pour the supernatant liquid upon a wetted, double, rapidly-acting, white filter, of a diameter of thirty centimeters. Then transfer the semi-liquid precipitate to the filter, rinse the bottle with 100 C.c. [old form 3 fl. oz. 96 minims] of Distilled Water, transfer this to the filter, and when the liquid has drained off, wash the barium phosphate on the filter with Distilled Water, until the filtrate measures 1000 C.c. [old form 2 pints]. Now add to it, first, 20 drops, and afterwards, if necessary, further, smaller quantities of Diluted Sulphuric Acid, until a small portion of the liquid, after filtration (which may be assisted by a little starch), is no longer rendered cloudy by Diluted Sulphuric Acid. Mix the cloudy liquid with about 10 Gm. [old form 146 grains] of starch by agitation, so that the starch may be thoroughly distributed throughout the liquid, and then filter it through a well-wetted, white filter of a diameter of twenty-five centimeters, returning the first portions until it runs through clear. When all the liquid has passed, ascertain the percentage of Hydrogen Dioxide contained in it by assay (see Part III.), and dilute the remaining liquid if necessary, so that it will contain 3 per cent. of absolute Hydrogen Dioxide.

Keep the product in loosely-stoppered bottles, in a cool place.

Since Solution of Hydrogen Dioxide will gradually diminish in strength, even when carefully kept, it should either be freshly made when wanted, or be kept on hand only in such quantity as will probably be consumed within a short time. Any Solution which has become weaker need not, for this reason, be thrown away, but may be reserved for an occasion when a weaker or diluted solution is prescribed or demanded. Or it may be employed, when making a fresh supply, as a diluent of the stronger solution.

AQUA MENTHÆ PIPERITÆ. U. S. Peppermint Water.

	Metric.	Old form.
Oil of Peppermint	2 C.c.	80 minims.
Precipitated Calcium Phosphate	4 Gm.	60 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Oil of Peppermint with the Precipitated Calcium Phosphate, add the Distilled Water gradually, under constant trituration, and filter.

AQUA MENTHÆ VIRIDIS. U. S. Spearmint Water.

	Metric.	Old form.
Oil of Spearmint	2 C.c.	80 minims.
Precipitated Calcium Phosphate	4 Gm.	60 grains.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Oil of Spearmint with the Precipitated Calcium Phosphate, add the Distilled Water gradually, under constant trituration, and filter.

AQUA ROSÆ. U. S. Rose Water.

Old form.

Stronger Rose Water,

Distilled Water, of each, one volume 8 fl. oz.

Mix them immediately before use.

AQUA ROSÆ FORTIOR. U. S. Stronger Rose Water.

[AQUA ROSÆ, PHARM. 1880. TRIPLE ROSE WATER.]

Water saturated with the volatile oil of Rose petals, obtained as a by-product in the distillation of Oil of Rose.

Stronger Rose Water should be kept in well-stoppered bottles, in a dark place.

Stronger Rose Water should be colorless and clear, not mucilaginous, and give no reaction with hydrogen sulphide or ammonium sulphide T. S. (absence of *metallic impurities*).

Liquores. Solutions:

Under this head the U. S. Pharmacopœia places all aqueous solutions of non-volatile substances except such as naturally form separate distinctive classes, as the syrups, infusions, and decoctions.

This classification is adopted only in the U. S. Pharmacopœia, the British standard embracing, in addition, gaseous and saccharine solutions, as Liquor Ammonia, Liquor Calcis Saccharatus, etc., whilst the German Pharmacopœia does not adopt any definite method, solutions of volatile and non-volatile substances both being in the class *Aquæ* and also in the class *Liquores*; *Aqua Rosæ* and *Aqua Plumbi* being together, and *Liquor Ammonii Caustici* and *Liquor Natri Caustici* being in the same class.

The official solutions constitute a most interesting group of preparations. They are usually very active medicinal agents, and some of them are powerful poisons. The number of official solutions is *twenty-four*. The following tables exhibit in condensed form a view of the class *Liquores*, U. S. P., arranged alphabetically in two classes. 1. Simple aqueous solutions, in which the solid dissolved is not altered in any respect, except so far as depends upon its external form. 2. Chemical aqueous solutions, or those in which the properties of the dissolved body or bodies are changed by chemical action or heat (see page 199).

LIQUORES, U. S. P.

1. Simple Solutions (aqueous).

Name.	Composition.
Liquor Acidi Arsenosi	1 per cent. As_2O_3 , 5 per cent. dil. HCl.
Arseni et Hydrargyri Iodidi	1 per cent. AsI_3 , 1 per cent. HgI_2 .
Calcis	Saturated Solution $Ca(OH)_2$.
Iodi Compositus	5 per cent. I, 10 per cent. KI.
Plumbi Subacetatis Dilutus	8 per cent. Sbl. Lead Subacetate.
Potassæ	5.6 per cent. Potassa (second formula).
Sodæ	5.6 per cent. Soda (second formula).
Sodii Arsenatis	1 per cent. dried Sodium Arsenate.
Sodii Silicatis	Nearly Saturated Solution.

2. Chemical Solutions (aqueous).

Name.	Composition.
Liquor Ammonii Acetatis	Dil. Acetic Acid with Ammonium Carbonate.
Ferri Acetatis	Ferric Hydrate with Glacial Acetic Acid and Water (81 per cent. anhydrous Ferric Acetate).
Ferri Chloridi	Iron, HCl , HNO_3 , and Distilled Water (87.8 per cent. anhydrous Ferric Chloride).
Ferri Citratis	Ferric Hydrate with Citric Acid and Water (42.5 to 43 per cent. of Scaled Salt).
Ferri et Ammonii Acetatis	Ferric Chloride, Dil. Acetic Acid, Ammonium Acetate, Aromatic Elixir, Glycerin, and Water.
Ferri Nitratis	Ferric Hydrate with Nitric Acid and Water (6.2 per cent. anhydrous Ferric Nitrate).
Ferri Subsulphatis	Ferrous Sulphate, H_2SO_4 , HNO_3 , Water (18.6 per cent. of Metallic Iron).
Ferri Tersulphatis	Ferrous Sulphate, H_2SO_4 , HNO_3 , Water (28.7 per cent. of the Salt).
Hydrargyri Nitratis	40 per cent. Red Mercuric Oxide, 45 per cent. Nitric Acid, Water (about 60 per cent. Mercuric Nitrate, and 11 per cent. HNO_3).
Magnesii Citratis	Magnesium Carbonate, Citric Acid, Syrup of Citric Acid, Potassium Bicarbonate, Water.
Plumbi Subacetatis	Lead Acetate, Lead Oxide, Water (about 25 per cent. Lead Subacetate).
Potassæ	Potassium Bicarbonate, Lime, Water (about 5 per cent. Potassa).
Potassii Arsenitis	1 per cent. Arsenous Acid, 2 per cent. Potass. Bicarb., 3 per cent. Compound Tincture of Lavender, Water.
Potassii Citratis	Potassium Bicarbonate, Citric Acid, Water (about 9 per cent. anhydrous Potassium Citrate).
Sodæ	Sodium Carbonate, Lime, Water (about 5 per cent. Sodium Hydrate).
Sodæ Chloratæ	Sodium Carbonate, Chlorinated Lime, Water (at least 2.6 per cent. by weight available Chlorine).
Zinci Chloridi	Zinc, Nitric Acid, Precipitated Zinc Carbonate, HCl , Water (about 50 per cent. by weight Zinc Chloride).

The official solutions vary so greatly in their properties and method of preparation, that no general formula or remarks can be given here to aid the student in studying them individually which would compare in value with the careful consideration that should be given each separate formula. These processes will be found under the head of the bases entering into them in Part III. For general manipulations of solutions, see page 199.

QUESTIONS ON CHAPTER XXI.

AQUEOUS SOLUTIONS.

- How may the various forms of official preparations be conveniently classified?
 What are the preparations known as waters?
 Are any other preparations recognized as waters by the French and German Pharmacopœias?
 What various methods have been used for preparing official waters?
 How many official waters are there?
 What are the medicated waters generally used for?
 What is the process of preparing a medicated water from a volatile liquid?
 How is a solution of a gas obtained?
 How many distilled waters are there?
 From what is *aqua amygdalæ amaræ* prepared, and of what strength is it?
 What is the strength of *aqua creosoti*? Of *aqua ammoniæ*? Of *aqua ammoniæ fortior*? Of *aqua chlori*?
 Are the volatile oils generally more soluble in hot or in cold water?
 In the preparation of medicated waters, what is the object of passing the liquid through an absorbent powder?
 What substance has most generally been used for the purpose?
 What is an objection to its use?
 What other various substances have been used?
 Where solutions of alkaloids or of nitrate of silver are to be made, what should be used?
 What substance is used in the official process?
 Describe the process.
 What is the strength of the following waters: *aqua anisi*, *aqua camphoræ*, *aqua cinnamomi*, *aqua fœniculi*, *aqua menthæ piperitæ*, *aqua menthæ viridis*?
 Of the various processes for preparing medicated waters, which is the best?
 What precautions should be observed in order to obtain distilled waters of the best quality?
 How may a drug be prevented from being injured by heat during distillation?
 In distilling rose water or orange flower water, is a naked fire or steam heat preferable, and why?
 How may distilled waters be preserved?
 Is alcohol useful for the purpose?
 What is the objection to it?
 What is the strength of orange flower water?
 What is the strength of rose water?
 Write out in full the Latin name of bitter almond water.
 Give the formula and mode of preparing it. Of preparing *aqua anisi*.
 How is orange flower water prepared?
 Give the formula and mode of preparing camphor water.
 What is chlorine water?
 How much chlorine does it contain?
 How is it prepared?
 Give the formula and mode of preparing cinnamon water. Creosote water.
 How is distilled water prepared?
 Give the formula and mode of preparing fennel water. Peppermint water.
 Write out in full the Latin name of peppermint water. Of spearmint water.
 Give the formula and mode of preparing spearmint water.
 How is rose water prepared?
 What are Liqueurs of the U. S. P.?
 How many official solutions are there?
 Into what two classes are solutions divided?

CHAPTER XXII

AQUEOUS SOLUTIONS CONTAINING SWEET OR VISCID SUBSTANCES.

Syrupi. *Syrups.*

SYRUPS are concentrated solutions of sugar in water or aqueous liquids. The liquids used sometimes contain acetic or other organic acids, and occasionally a small quantity of alcohol. When water *alone* is used in making the solution of sugar, the preparation is termed *syrup*, or *simple syrup*. When the water contains soluble principles from various medicinal substances, the syrup is called a *medicated syrup*. A *flavored syrup* is one which is not medicinal in its action, but which is made by the introduction of various aromatic or pleasantly-flavored substances. Syrups are useful preparations, because their sweet taste facilitates administration, whilst the presence of a large percentage of sugar renders them permanent if they are properly made.

Selection of the Sugar.—The sugar which should be used exclusively in making syrups is clearly defined by the Pharmacopœia. It is described as in white, dry, hard, distinctly crystalline granules, permanent in the air, odorless, having a purely sweet taste, and a neutral reaction. This description corresponds with the sugar known commercially as “granulated,” and the official tests prescribed should be carefully observed. (See *Saccharum*.) The direction that the sugar should be dry is all-important, because the permanency of syrups largely depends upon their containing the correct proportion of sugar and water. If an insufficient amount of sugar is present, the syrups will ferment; if they contain too much, crystallization of the excess takes place at first, whilst the subsequent growth of the crystals is accompanied by an abstraction of sugar from the liquid, and the result is such a weakening of the syrup that fermentation results, as in the first instance. *Damp sugar* should never be used unless the amount of moisture has been carefully ascertained, and an allowance made for it.

Preparation of Syrups.—Syrups are prepared in various ways, and the choice of the proper method must always depend upon the physical and chemical characteristics of the substances entering into the preparation. Five methods are officially recognized, which may be summarized as follows: 1. By solution with heat. 2. By agitation without heat. 3. By the simple addition of a medicating liquid to syrup. 4. By digestion or maceration. 5. By percolation.

1. **By Solution with Heat.**—This is the usual method of making syrups when the valuable constituent is not volatile nor injured by heat, and when it is desirable to make the syrup rapidly. The sugar is usually dissolved in the water or aqueous solution and heated until solution is effected, skimmed, strained, and the proper quantity of water added to make the desired weight or measure. If the syrup is made from an infusion, a decoction, or an aqueous solution containing organic matter, it is usually proper to heat the syrup to the boiling-point, in order to coagulate albuminous matter: this is separated subsequently by straining. If the albumen or other impurities were suffered to remain in the syrup, fermentation would probably be induced in warm weather. Saccharometers (see page 83) are very useful in making syrups by the hot process where the specific gravity of the finished syrup is known. This instrument may be floated in the syrup *whilst boiling*, and thus the exact degree of concentration determined without waiting to cool the syrup and having to heat it again subsequently to concentrate it further.

2. **By Agitation without Heat.**—This process is directed by the Pharmacopœia to be used in those cases where there is likelihood of loss of valuable volatile constituents. It is the principal cold process adopted by the Pharmacopœia. The aqueous solution is usually directed to be added to the sugar in a bottle, and the whole well shaken together until the sugar is dissolved. This is best effected by allowing the tightly-corked bottle to lie upon its side during the intervals of agitation.

3. **By the Simple Addition of Medicating Liquid to Syrup.**—This method is resorted to in those cases in which fluid extracts, tinctures, or other liquids are added to syrup in order to medicate it. Syrups made in this way usually show precipitates in time, owing to the fact that alcohol enters into most of the liquids thus used, and the resinous and oily substances dissolved by the alcohol often precipitate when mixed with the syrup, producing unsightly preparations.

4. **By Maceration or Digestion.**—But one official syrup is made by digestion,—i.e., syrup of tolu. This method, as shown in this preparation, is not recommended as either accurate or efficient. A solution of a comparatively insoluble substance, like balsam of tolu, can always be effected in a more rapid and thorough manner by dissolving the substance in alcohol, mixing the tincture with sugar, and then getting rid of the alcohol subsequently by evaporation, or by the simpler and better method of suspending the resinous tincture in a mixture of magnesium carbonate and water, filtering, and retaining the small proportion of alcohol in the finished syrup. The process of maceration *without* digestion is used in making the official syrup of tar, and consists simply in stirring the purified tar with boiling distilled water, macerating for thirty-six hours, decanting the solution, and filtering.

5. **Percolation in making Syrups.**—This method originated with Orynski, and is conducted as follows. Into the lower orifice of an ordinary percolator is introduced a small piece of sponge, the sugar (granulated) is then poured in, and upon this the water, the apparatus being arranged as is usual in the process of percolation. The percolator may be covered loosely, and the operation will proceed without further attention, the syrup coming through drop by drop. If it should be

necessary to use crushed sugar, the percolator must be corked at the lower orifice, and the sugar and water introduced and allowed to macerate until the former has dissolved down to *half its bulk*, when the cork may be removed and the liquid be allowed to drop. If, after the liquid has all passed, there remains a quantity of undissolved sugar in the percolator, enough percolate may be poured back to dissolve it, afterwards adding sufficient water to bring the whole up to the required measure.

To be successful in using this process, care in several particulars must be exercised: 1. The percolator used should be cylindrical or semi-cylindrical, and cone-shaped as it nears the lower orifice. 2. The sugar must be coarse, else it will form into a compact mass, which the liquid cannot permeate. 3. The sponge must be introduced with care. If pressed too tightly in, it will effectually stop the process; if inserted too loosely, the liquid will pass too rapidly, and will, in consequence, be weak and turbid (from imperfect filtration).

Preservation of Syrups.—Syrups should never be made in larger quantities than can be used within a few months, except in those cases where special facilities can be employed for their preservation. A low temperature is the best preservative for syrups: concentration without supersaturation is also a condition favorable to preservation. The addition of substances like boric acid or salicylic acid, alcohol, calcium sulphite, etc., to prevent the fermentation of syrups, is not recommended, for if used in sufficient quantity to act as preservatives they communicate their own flavor to the syrup, or are otherwise objectionable. The practice of restoring syrups which have been spoiled through fermentation by heating them and "working them over" is a reprehensible one. The practice of good pharmacy demands the possession of sufficient moral courage to find a place for fermented syrups where they will do the least harm,—i.e., in the sink and gutter-pipe.

A simple and practical method of preserving syrups, which is very effective, is as follows. A number of bottles are provided holding not more than a pint each, even when the quantity of syrup is large; the bottles are thoroughly cleaned, and kept hot by immersion in boiling water until ready for use; and a sufficient number of good corks, which have been thoroughly soaked in hot water, and of the proper size for the bottles, should be at hand. The syrup should be heated to the boiling-point (strained, if necessary, and reheated), and poured into the hot bottles until they are filled to the brim. The corks are inserted by forcibly pressing them into the necks of the bottles, thereby displacing a small portion of the syrup, and are tied down with twine in the usual manner. Then, whilst the necks of the bottles are still hot (and before the syrup can contract in volume through cooling) they are dipped into melted sealing-wax contained in a suitable vessel. By this method the germs which are supposed to produce fermentation are destroyed by the heat, and no air can find its way to the syrup, as the bottles are hermetically sealed. Fruit-juices may be preserved in the same way.

Official Syrups.—There are THIRTY-TWO official syrups. Of this number FOUR are made by *solution with heat*, FOURTEEN by the *simple addition of medicating liquid to syrup*, THIRTEEN by *agitation of the sugar with the medicating liquid without heat*, and ONE by *maceration or digestion*.

Table of Official Syrups, arranged in Classes according to the Methods employed in their Preparation.

Name and Method of Preparation.	Sub-Classes.	Proportions.
Solution with Heat.		
Syrupus.		850 Gm. Sugar; Distilled Water to 1000 C.c.
Calcis.		65 Gm. Lime; 400 Gm. Sugar; Water to 1000 C.c.
Ferri Iodidi.	Solution involving chemical action preserved by sugar.	(Containing 10 p.c. Ferrous Iodide.) 25 Gm. Iron Wire; 88 Gm. Iodine; Syrup, Distilled Water, to 1000 Gm.
Rubi Idæi.	From clarified raspberry juice.	Fresh ripe Raspberries and Sugar.
Scillæ.	Containing acetic acid.	450 C.c. Vinegar of Squill; 800 Gm. Sugar; Water to 1000 C.c.
Simple Addition of Medicating Liquid to Syrup.		
Syrupus Acaciæ.	With mucilage.	250 C.c. Mucilage; Syrup to 1000 C.c.
Acidi Citrici.	With flavored acidulated solution.	10 Gm. Citric Acid; 10 C.c. Water; 10 C.c. Spirit of Lemon; Syrup to 1000 C.c.
Rhei Aromaticus.	With aromatic tincture.	150 C.c. Aromatic Tincture of Rhubarb; 850 C.c. Syrup.
Tolutanus.	With strong tincture.	10 Gm. Balsam of Tolu; 50 Gm. Precipitated Calcium Phosphate; 850 Gm. Sugar; 50 C.c. Alcohol; Water to 1000 C.c.
Lactucarii.	With tincture.	100 C.c. Tincture of Lactucarium; 50 Gm. Precipitated Calcium Phosphate; 750 Gm. Sugar; Water to 1000 C.c.
Ipecacuanhæ.	With fluid extract.	70 C.c. Fluid Extract of Ipecac; 10 C.c. Acetic Acid; 100 C.c. Glycerin; 700 Gm. Sugar; Water to 1000 C.c.
Krameris.	" "	450 C.c. Fluid Extract of Krameria; 550 C.c. Syrup.
Rhei.	" "	100 C.c. Fluid Extract of Rhubarb; 4 C.c. Spirit of Cinnamon; 10 Gm. Potassium Carbonate; 50 C.c. Glycerin; 50 C.c. Water; Syrup to 1000 C.c.
Rosæ.	" "	125 C.c. Fluid Extract of Rose; 875 C.c. Syrup.
Rubi.	" "	250 C.c. Fluid Extract of Rubus; 750 C.c. Syrup.
Sarsaparillæ Compositus.	" "	200 C.c. Fluid Extract of Sarsaparilla; 15 C.c. Fluid Extract of Glycyrrhiza; 15 C.c. Fluid Extract of Senna; 650 Gm. Sugar; 0.1 C.c. Oil of Sassafras; 0.1 C.c. Oil of Anise; 0.1 C.c. Oil of Gaultheria; Water to 1000 C.c.
Scillæ Compositus.	Medicated water from tincture.	80 C.c. Fluid Extract of Squill; 80 C.c. Fluid Extract of Senega; 2 Gm. Antimony and Potassium Tartrate; 10 Gm. Precipitated Calcium Phosphate; 750 Gm. Sugar; Water to 1000 C.c.
Senegæ.	" "	200 C.c. Fluid Extract of Senega; 5 C.c. Ammonia Water; 700 Gm. Sugar; Water to 1000 C.c.
Zingiberis.	Medicated water from fluid extract.	80 C.c. Fluid Extract of Ginger; 15 Gm. Precipitated Calcium Phosphate; 850 Gm. Sugar; Water to 1000 C.c.

Table of Official Syrups, etc.—(Continued.)

Name and Method of Preparation.	Sub-Classes.	Proportions.
Agitation of Sugar with Medicating Liquid or simple admixture without Heat.		
Syrupus Allii.	Containing acetic acid.	200 Gm. Fresh Garlic; 800 Gm. Sugar; Diluted Acetic Acid to 1000 C.c.
Althææ.	From cold aqueous infusion.	50 Gm. Althææ; 80 C.c. Alcohol; 100 C.c. Glycerin; 700 Gm. Sugar; Water to 1000 C.c.
Pruni Virginianæ.	" "	150 Gm. Wild Cherry; 700 Gm. Sugar; 150 C.c. Glycerin; Water to 1000 C.c.
Sennæ.	From infusion in boiling water.	250 Gm. Alexandria Senna; 5 C.c. Oil of Coriander; 150 C.c. Alcohol; 700 Gm. Sugar; Water to 1000 C.c.
Amygdalæ.	From emulsion.	140 Gm. Sweet Almond; 40 Gm. Bitter Almond; 200 Gm. Sugar; 100 C.c. Orange Flower Water; 180 C.c. Water; Syrup to 1000 C.c.
Aurantii.	Medicated water from tincture.	50 Gm. Sweet Orange Peel; 50 Gm. Precipitated Calcium Phosphate; 700 Gm. Sugar; Alcohol, Water, to 1000 C.c.
Aurantii Florum.	Simple admixture or solution.	850 Gm. Sugar; Orange Flower Water, to make 1000 C.c.
Ferri Quininae et Strychninae Phosphatum.	" "	20 Gm. Soluble Ferric Phosphate; 80 Gm. Quinine Sulphate; 0.2 Gm. Strychnine; 48 C.c. Phosphoric Acid; 100 C.c. Glycerin; 50 C.c. Water; Syrup to 1000 C.c.
Hypophosphitum.	" "	45 Gm. Calcium Hypophosphite; 15 Gm. Potassium Hypophosphite; 15 Gm. Sodium Hypophosphite; 2 Gm. Diluted Hypophosphorous Acid; 500 Gm. Sugar; 5 C.c. Spirit of Lemon; Water to 1000 C.c.
Hypophosphitum cum Ferro.	" "	10 Gm. Ferrous Lactate; 10 Gm. Potassium Citrate; Syrup of Hypophosphites to 1000 C.c.
Acidi Hydriodici.	Solution involving chemical reaction.	(Containing 1 p.c. Absolute Hydriodic Acid.) 18 Gm. Potassium Iodide; 1 Gm. Potassium Hypophosphite; 12 Gm. Tartaric Acid; 15 C.c. Water; Diluted Alcohol, Syrup, to 1000 Gm.
Calci Lactophosphatis.	" "	60 C.c. Lactic Acid; 86 C.c. Phosphoric Acid; 25 C.c. Orange Flower Water; 25 Gm. Precipitated Calcium Carbonate; 700 Gm. Sugar; Water to 1000 C.c.
By Maceration or Digestion.		
Syrupus Picis Liquidæ.		75 Gm. Tar; 150 C.c. Water; 400 C.c. Boiling Distilled Water; 100 C.c. Glycerin; 800 Gm. Sugar; Distilled Water to 1000 C.c.

SYRUPUS. U. S. Syrup.

	Metric.	Old form.
Sugar, in coarse powder	850 Gm.	7 lb. 1½ oz. av.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Dissolve the Sugar, with the aid of heat, in 450 C.c. [old form 58 fl. oz.] of Distilled Water, raise the temperature to the boiling point, strain the liquid, and pass enough Distilled Water through the strainer to make the product, when cold, measure 1000 C.c. [old form 8 pints]. Mix thoroughly.

Syrup may also be prepared in the following manner :

Press down into the neck of a percolator or funnel of suitable size a tapering piece of coarse, well-cleaned sponge, not too tightly, and in such a manner that the whole sponge shall be within the neck of the percolator, its upper end being about half an inch below its commencement. Place the Sugar in the apparatus, make its surface level without shaking or jarring, then carefully pour on 450 C.c. [old form 58 fl. oz.] of Distilled Water, and regulate the flow of the liquid, if necessary, so that it will pass out in rapid drops. Return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Distilled Water, added in portions, so that all the Sugar may be dissolved, and the product measure 1000 C.c. [old form 8 pints]. Mix thoroughly.

Syrup thus prepared has a specific gravity of about 1.317.

SYRUPUS ACACIÆ. U. S. Syrup of Acacia.

	Metric.	Old form.
Mucilage of Acacia, recently prepared	25 C.c.	1 fl. oz.
Syrup	75 C.c.	3 fl. oz.
To make	100 C.c.	4 fl. oz.

Mix them.

This syrup should be freshly prepared, when required.

SYRUPUS ACIDI CITRICI. U. S. Syrup of Citric Acid.

	Metric.	Old form.
Citric Acid	10 Gm.	146 grains.
Water	10 C.c.	2½ fl. dr.
Spirit of Lemon	10 C.c.	2½ fl. dr.
Syrup, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Citric Acid in the Water, and mix the solution with 500 C.c. [old form 1 pint] of Syrup. Then add the Spirit of Lemon, and, lastly, enough Syrup to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS ACIDI HYDRIODICI. U. S. Syrup of Hydriodic Acid.

A syrupy liquid containing about 1 per cent., by weight, of absolute Hydriodic Acid [HI = 127.53], or about 1.3 Gm. in 100 C.c.

	Metric.	Old form.
Potassium Iodide	13 Gm.	250 grains.
Potassium Hypophosphite	1 Gm.	19 grains.
Tartaric Acid	12 Gm.	281 grains.
Water	15 C.c.	5 fl. dr.
Diluted Alcohol,		
Syrup, each, a sufficient quantity,		
To make	1000 Gm.	2 pints.

Dissolve the two Potassium salts in the Water, and the Tartaric Acid in 25 C.c. [old form 1 fl. oz.] of Diluted Alcohol. Mix the two solutions in a vial, shake it thoroughly, and place it in ice-water for half an hour, occasionally shaking. Then filter the mixture through a small, rapidly-acting, white filter, and carefully wash the vial and filter with Diluted Alcohol, until the filtrate ceases to produce more than a faint cloudiness when a drop or two is allowed to fall into silver nitrate test-solution. Reduce the filtrate, by evaporation in a tared capsule, on a water-bath, to 50 Gm. [old form 960 grains], and mix it, when cold, with enough Syrup to make the product weigh 1000 Gm. [old form 2 pints].

A transparent, colorless, or not more than pale straw-colored liquid, odorless, and having a sweet and acidulous taste.

Specific gravity: about 1.813 at 15° C. (59° F.).

If a small portion of the Syrup be mixed with a little starch T.S., and a few drops of chlorine water then added, the liquid will acquire a deep blue color. Not more than a faint bluish tint should be produced in the Syrup by starch T.S. alone (limit of *free iodine*).

The addition of silver nitrate T.S. to a small portion of the Syrup produces a pale yellow precipitate, nearly insoluble in ammonia water.

If 32 (31.88) Gm. of the Syrup be exactly neutralized by ammonia water, and then mixed with 2 drops of potassium chromate T.S., it should require about 25 C.c. of decinormal silver nitrate V.S. to produce a permanent red tint (corresponding to about 1 per cent. of absolute Hydriodic Acid).

SYRUPUS ALLII. U.S. Syrup of Garlic.

	Metric.	Old form.
Fresh Garlic, sliced and bruised	300 Gm.	6 oz. av. 296 gr.
Sugar	800 Gm.	26 oz. av. 308 gr.
Diluted Acetic Acid, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Macerate the Garlic with 300 C.c. [old form 9½ fl. oz.] of Diluted Acetic Acid during four days, and express the liquid, avoiding the use of metallic utensils. Then mix the residue with 200 C.c. [old form 6½ fl. oz.] more of Diluted Acetic Acid, and again express. Mix the expressed liquids, and filter. Pour the filtrate upon the Sugar, contained in a suitable vessel, and stir or agitate until the Sugar is dissolved. Lastly, add enough Diluted Acetic Acid to make the product measure 1000 C.c. [old form 2 pints], and mix thoroughly.

Keep the Syrup in well-stoppered, completely filled bottles, in a cool place.

Syrup of Garlic may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Diluted Acetic Acid, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS ALTHÆÆ. U. S. Syrup of Althæa.

	Metric.	Old form.
Althæa, cut into small pieces	50 Gm.	1 oz. av. 293 gr.
Alcohol	30 C.c.	460 minims.
Glycerin	100 C.c.	8 fl. oz. 96 min.
Sugar	700 Gm.	23 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Wash the Althæa with cold Water, then macerate it with 400 C.c. [old form 13 fl. oz.] of Water previously mixed with the Alcohol, during one hour, stirring frequently, and strain without expressing the residue. In the strained liquid dissolve the Sugar by agitation, without heat, add the Glycerin, and enough Water to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Keep the Syrup in well-stoppered, completely filled bottles, in a cool place.

SYRUPUS AMYGDALÆ. U. S. Syrup of Almond.

	Metric.	Old form.
Sweet Almond	140 Gm.	4 oz. av. 295 gr.
Bitter Almond	40 Gm.	1 oz. av. 147 gr.
Sugar	200 Gm.	6 oz. av. 296 gr.
Orange Flower Water	100 C.c.	8 fl. oz. 96 min.
Water	200 C.c.	6 fl. oz. 192 min.
Syrup, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Rub the Almonds, previously blanched, in a mortar with 100 Gm. [old form 3 oz. av. 148 gr.] of the Sugar and 30 C.c. [old form 1 fl. oz.] of Water to a smooth paste. Mix this well with the Orange Flower Water and 200 C.c. [old form 6 fl. oz. 192 min.] of Water, and strain with strong expression. To the residue add 100 C.c. [old form 3 fl. oz. 96 min.] of Water, and express again. In the strained liquid dissolve the remainder of the Sugar, without heat, adding enough Water to make the product measure 1000 C.c. [old form 2 pints].

Keep the Syrup in well-stoppered, completely filled bottles, in a cool place.

SYRUPUS AURANTII. U. S. Syrup of Orange.

	Metric.	Old form.
Sweet Orange Peel, taken from the fresh fruit	50 Gm.	1 oz. av. 293 gr.
Precipitated Calcium Phosphate	50 Gm.	1 oz. av. 293 gr.
Sugar	700 Gm.	23 oz. av. 160 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Introduce the Sweet Orange Peel (which should be as free as possible from the white, inner layer, and cut into small shreds) into a flask, and add 80 C.c. [old form 2½ fl. oz.] of Alcohol. Stopper the flask loosely with a notched cork, apply the heat of a water-bath until the Alcohol boils, and maintain it boiling during five minutes. Then stopper the flask well, and set it aside to cool. Filter off the liquid, and wash the filter and contents with Alcohol until the filtrate measures 100 C.c. [old form 3 fl. oz.]. Mix the Precipitated Calcium Phosphate, in a mortar, with 150 Gm. [old form 5 oz. av.] of Sugar, and add the tincture with constant trituration. To the resulting, pasty mass add 300 C.c. [old form 9½ fl. oz.] of Water, triturating constantly, transfer the whole to a filter, and return the first portions of the filtrate, if necessary, until it runs through clear. In the filtrate dissolve the remainder of the Sugar, and add enough Water, through the filter, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS AURANTII FLORUM. U.S. Syrup of Orange Flowers.

	Metric.	Old form.
Sugar	850 Gm.	28 oz. av. 164 gr.
Orange Flower Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Sugar in 450 C.c. [old form 14½ fl. oz.] of Orange Flower Water by agitation, without heat, add enough Orange Flower Water to make the product measure 1000 C.c. [old form 2 pints], and mix thoroughly.

Syrup of Orange Flowers may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour 450 C.c. [old form 14½ fl. oz.] of Orange Flower Water upon the Sugar, return the first portions of the percolate until it runs through clear, and, when all the liquid has passed, follow it by Orange Flower Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS CALCII LACTOPHOSPHATIS. U.S. Syrup of Calcium Lactophosphate.

	Metric.	Old form.
Precipitated Calcium Carbonate	25 Gm.	865 grains.
Lactic Acid	60 C.c.	1 fl. oz. 442 min.
Phosphoric Acid	36 C.c.	1 fl. oz. 72 min.
Orange Flower Water	25 C.c.	884 minims.
Sugar	700 Gm.	28 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Lactic Acid mixed with 100 C.c. [old form 3 fl. oz. 96 min.] of Water, and contained in a capacious mortar, gradually add the Calcium Carbonate, in portions, until it is dissolved. Then add the

Phosphoric Acid, and triturate until the precipitate at first formed is dissolved. Add 150 C.c. [old form 4 fl. oz. 6 fl. dr.] of Water, and filter, rinsing the mortar with 75 C.c. [old form 2½ fl. oz.] of Water, and passing the rinsings through the filter. To the mixed filtrates add the Orange Flower Water, and, having added the Sugar, dissolve it by agitation, without heat, and strain. Lastly, pass enough water through the strainer to make the product measure 1000 C.c. [old form 2 pints], and mix thoroughly.

SYRUPUS CALCIS. U.S. Syrup of Lime.

	Metric.	Old form.
Lime	65 Gm.	2 oz. av. 74 gr.
Sugar	400 Gm.	18 oz. av. 154 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Lime and Sugar thoroughly in a mortar, so as to form a homogeneous powder; then add the mixture to 500 C.c. [old form 1 pint] of boiling Water, contained in a bright copper or tinned iron vessel, boil for five minutes, constantly stirring, and then strain. Dilute the strained liquid with an equal volume of Water, and filter through white paper. Then evaporate the filtrate, in a tared capsule, to 700 Gm. [old form 23 oz. av. 160 gr.], allow it to cool, add to it enough Water to make the product measure 1000 C.c. [old form 2 pints], and mix thoroughly.

Keep the Syrup in well-stoppered bottles.

SYRUPUS FERRI IODIDI. U.S. Syrup of Ferrous Iodide.

A syrupy liquid containing about 10 per cent., by weight, of Ferrous Iodide [$\text{FeI}_2 = 308.94$], or about 18.4 Gm. in 100 C.c.

	Metric.	Old form.
Iron, in the form of fine bright wire, and cut into small pieces	25 Gm.	495 grains.
Iodine	83 Gm.	8 oz. av. 828 gr.
Syrup,		
Distilled Water, each, a sufficient quantity,		
To make	1000 Gm.	2 pints.

Introduce the Iron into a flask of thin glass, having a capacity of about 500 C.c. [old form 1 pint], add to it 150 C.c. [old form 5 fl. oz.] of Distilled Water, and afterwards the Iodine. Shake the mixture occasionally, checking the reaction, if necessary, by the affusion of cold water, and, when the solution has acquired a greenish color, and has lost the odor of Iodine, heat it to boiling. Then filter it through a strong, double, rapidly-acting filter placed in a funnel, the point of which dips below the surface of 600 Gm. [old form 19 fl. oz.] of Syrup contained in a tared vessel. When the liquid has run through, wash the flask, and filter with a mixture of 25 C.c. [old form 1 fl. oz.], each, of Syrup and Distilled Water, previously raised to near 100° C.

(212° F.), then withdraw the funnel, add enough Syrup to make the product weigh 1000 Gm. [old form 2 pints], and mix thoroughly.

Keep the Syrup in small, well-stoppered, and completely filled bottles.

A transparent, pale green liquid, having a sweet, strongly ferruginous taste, and a neutral reaction.

Specific gravity: about 1.353 at 15° C. (59° F.).

On adding a few drops of potassium ferricyanide T.S. to a small portion of the Syrup, a blue precipitate will be produced.

If mixed with a little starch T.S., and afterwards with a few drops of chlorine water, the Syrup will acquire a deep blue color. This color should not be produced in the Syrup by starch T.S. alone (absence of *free iodine*).

If 1.65 Gm. (1.5447 Gm.) of the Syrup and 10 C.c. of water be introduced into a flask, and the liquid mixed, successively, with 11 C.c. of decinormal silver nitrate V.S. and 5 C.c., each, of diluted nitric acid and ferric ammonium sulphate T.S., it should not require more than about 1 C.c. of decinormal potassium sulphocyanate V.S. to produce a reddish-brown tint which persists after shaking (corresponding to about 10 per cent. of Ferrous Iodide).

SYRUPUS FERRI, QUININÆ ET STRYCHNINÆ PHOSPHATUM. U. S.

Syrup of the Phosphates of Iron, Quinine, and Strychnine.

	Metric.	Old form.
Soluble Ferric Phosphate	20 Gm.	292 grains.
Quinine Sulphate	30 Gm.	438 grains.
Strychnine	0.2 Gm.	3 grains.
Phosphoric Acid	48 C.c.	1 fl. oz. 258 min.
Glycerin	100 C.c.	3 fl. oz. 96 min.
Water	50 C.c.	1 fl. oz. 288 min.
Syrup, a sufficient quantity,		•
To make	1000 C.c.	2 pints.

Heat the Soluble Ferric Phosphate with the Water, in a porcelain capsule, until it is dissolved. Then add the Phosphoric Acid, the Quinine Sulphate, and the Strychnine, and stir, until solution is effected. Filter the liquid into the Glycerin, contained in a graduated bottle, add enough Syrup to make up the volume to 1000 C.c. [old form 2 pints], and mix thoroughly. Lastly, strain, if necessary.

SYRUPUS HYPOPHOSPHITUM. U. S. Syrup of Hypophosphites.

	Metric.	Old form.
Calcium Hypophosphite	45 Gm.	660 grains.
Potassium Hypophosphite	15 Gm.	220 grains.
Sodium Hypophosphite	15 Gm.	220 grains.
Diluted Hypophosphorous Acid	2 Gm.	30 minims.
Sugar	500 Gm.	16 oz. av. 300 gr.
Spirit of Lemon	5 C.c.	76 minims.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Hypophosphites with 450 C.c. [old form 14½ fl. oz.] of Water, until they are dissolved, add the Spirit of Lemon, and the Hypophosphorous Acid, and filter the liquid. In the filtrate dissolve

the Sugar by agitation, without heat, and add enough Water, through the filter, to make the product measure 1000 C.c. [old form 2 pints]. Strain, if necessary.

Syrup of Hypophosphites may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under *Syrup* (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS HYPOPHOSPHITUM CUM FERRO. U.S. Syrup of Hypophosphites with Iron.

	Metric.	Old form.
Ferrous Lactate	10 Gm.	146 grains.
Potassium Citrate	10 Gm.	146 grains.
Syrup of Hypophosphites, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Rub the Ferrous Lactate and Potassium Citrate with a small quantity of the Syrup, gradually added, until they are dissolved. Then strain, and add enough Syrup of Hypophosphites to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

This preparation should be freshly made, when wanted.

SYRUPUS IPECACUANHÆ. U.S. Syrup of Ipecac.

	Metric.	Old form.
Fluid Extract of Ipecac	70 C.c.	2 fl. oz. 115 min.
Acetic Acid	10 C.c.	158 minims.
Glycerin	100 C.c.	8 fl. oz. 96 min.
Sugar	700 Gm.	28 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dilute the Fluid Extract of Ipecac with 300 C.c. [old form 9½ fl. oz.] of Water to which the Acetic Acid had previously been added, and mix them thoroughly by shaking. Then filter, and pass enough water through the filter to obtain 500 C.c. [old form 1 pint] of filtrate. To this liquid add the Glycerin, dissolve the Sugar in the mixture, and add enough Water to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly, and strain, if necessary.

Syrup of Ipecac may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under *Syrup* (see *Syrupus*). Mix the filtrate obtained as directed in the preceding formula with the Glycerin, pour the mixture upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS KRAMERIÆ. U. S. Syrup of Krameria.

	Metric.	Old form.
Fluid Extract of Krameria	450 C.c.	14 fl. oz. 8 fl. dr.
Syrup	550 C.c.	17 fl. oz. 5 fl. dr.
To make	1000 C.c.	2 pints.

Mix them.

SYRUPUS LACTUCARIÏ. U. S. Syrup of Lactucarium.

	Metric.	Old form.
Tincture of Lactucarium	100 C.c.	8 fl. oz. 96 min.
Precipitated Calcium Phosphate	50 Gm.	1 oz. av. 800 gr.
Sugar	750 Gm.	25 oz. av.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Precipitated Calcium Phosphate and 150 Gm. [old form 5 oz. av.] of the Sugar, in a mortar, with the Tincture of Lactucarium gradually added, and afterwards with 300 C.c. [old form 10 fl. oz.] of Water, added in small portions at a time. Filter the mixture, dissolve the remainder of the Sugar in the filtrate, and pass enough Water through the filter to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Syrup of Lactucarium may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS PICIS LIQUIDÆ. U. S. Syrup of Tar.

	Metric.	Old form.
Tar	75 Gm.	2½ oz. av.
Water	150 C.c.	5 fl. oz.
Boiling Distilled Water	400 C.c.	18 fl. oz.
Glycerin	100 C.c.	8 fl. oz. 96 min.
Sugar	800 Gm.	26 oz. av. 800 gr.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Tar intimately with about 100 Gm. [old form 3 oz. av.] of white sand, pour on the Water, and stir frequently during twelve hours; then pour off the Water and throw it away. Pour the Boiling Distilled Water upon the residue, stir well and frequently during fifteen minutes, add the Glycerin, and set the vessel aside for twenty-four hours, occasionally stirring. Decant the clear solution, and filter. Dissolve the Sugar in the filtrate with the aid of a gentle heat; allow the liquid to cool, then strain it, and pass enough Distilled Water

through the strainer to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS PRUNI VIRGINIANÆ. U.S. Syrup of Wild Cherry.

	Metric.	Old form.
Wild Cherry, in No. 20 powder	150 Gm.	5 oz. av.
Sugar	700 Gm.	28 oz. av. 160 gr.
Glycerin	150 C.c.	5 fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Glycerin with 300 C.c. [old form 9½ fl. oz.] of Water. Moisten the Wild Cherry with a sufficient quantity of the liquid, and macerate for twenty-four hours in a close vessel; then pack it firmly in a cylindrical percolator, and pour on the remainder of the menstruum. When the liquid has disappeared from the surface, follow it by Water, until the percolate measures 450 C.c. [old form 14½ fl. oz.]. Dissolve the Sugar in the percolate by agitation, without heat, strain, and pass enough Water through the strainer to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Syrup of Wild Cherry may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the percolate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS RHEI. U.S. Syrup of Rhubarb.

	Metric.	Old form.
Fluid Extract of Rhubarb	100 C.c.	8 fl. oz. 96 min.
Spirit of Cinnamon	4 C.c.	1 fl. dr.
Potassium Carbonate	10 Gm.	146 grains.
Glycerin	50 C.c.	1 fl. oz. 288 min.
Water	50 C.c.	1 fl. oz. 288 min.
Syrup, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Spirit of Cinnamon with the Fluid Extract of Rhubarb, and add to it the Potassium Carbonate dissolved in the Water. Then add the Glycerin, and, lastly, enough Syrup to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS RHEI AROMATICUS. U.S. Aromatic Syrup of Rhubarb.

	Metric.	Old form.
Aromatic Tincture of Rhubarb	150 C.c.	4½ fl. oz.
Syrup	850 C.c.	27½ fl. oz.
To make	1000 C.c.	2 pints.

Mix them.

SYRUPUS ROSÆ. U. S. Syrup of Rose.

	Metric.	Old form.
Fluid Extract of Rose	125 C.c.	4 fl. oz.
Syrup	875 C.c.	28 fl. oz.
To make	1000 C.c.	2 pints.

Mix them.

SYRUPUS RUBI. U. S. Syrup of Rubus.

	Metric.	Old form.
Fluid Extract of Rubus	250 C.c.	8 fl. oz.
Syrup	750 C.c.	24 fl. oz.
To make	1000 C.c.	2 pints.

Mix them.

SYRUPUS RUBI IDÆI. U. S. Syrup of Raspberry.

Fresh, Ripe Raspberries, any convenient quantity,
Sugar, a sufficient quantity.

Reduce the Raspberries to a pulp, and let this stand, at a temperature of about 20° C. (68° F.), until a small portion of the filtered juice mixes clear with half its volume of alcohol. Then separate the juice by pressing, set it aside, in a cool place, until the liquid portion has become clear, and filter. To every 40 parts by weight of the filtrate (which should not be allowed to remain, unprotected by sugar, more than about two hours) add 60 parts of Sugar, heat the mixture to boiling, avoiding the use of tinned vessels, and strain. Keep the product in well-stoppered bottles, in a cool and dark place.

On shaking separate portions of Syrup of Raspberries with ether, chloroform, or amylc alcohol, no color should be imparted to these liquids (absence of *foreign coloring matters*).

SYRUPUS SARSAPARILLÆ COMPOSITUS. U. S. Compound Syrup of Sarsaparilla.

	Metric.	Old form.
Fluid Extract of Sarsaparilla	200 C.c.	6½ fl. oz.
Fluid Extract of Glycyrrhiza	15 C.c.	½ fl. oz.
Fluid Extract of Senna	15 C.c.	½ fl. oz.
Sugar	650 Gm.	21 oz. av. 305 gr.
Oil of Sassafras	0.1 C.c.	2 drops.
Oil of Anise	0.1 C.c.	2 drops.
Oil of Gaultheria	0.1 C.c.	2 drops.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Add the Oils (equivalent to about 2 drops, each) to the mixed Fluid Extracts, and shake the liquid thoroughly. Then add enough Water to make up the volume to 600 C.c. [old form 19 fl. oz.], and mix well. Set the mixture aside for one hour, then filter it. Dissolve the sugar in the filtrate with the aid of a gentle heat, allow the liquid to cool, strain, and add enough Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS SCILLÆ. U. S. Syrup of Squill.

	Metric.	Old form.
Vinegar of Squill	450 C c.	14½ fl. oz.
Sugar	800 Gm.	26 oz. av. 308 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Heat the Vinegar of Squill to the boiling point, in a glass or porcelain vessel, and filter the liquid while it is hot. Dissolve the Sugar in the hot filtrate by agitation, without further heating, strain, and, when the strained liquid is cold, add enough Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS SCILLÆ COMPOSITUS. U. S. Compound Syrup of Squill.

	Metric.	Old form.
Fluid Extract of Squill	80 C.c.	2 fl. oz. 4½ fl. dr.
Fluid Extract of Senega	80 C.c.	2 fl. oz. 4½ fl. dr.
Antimony and Potassium Tartrate	2 Gm.	29 grains.
Precipitated Calcium Phosphate	10 Gm.	146 grains.
Sugar	750 Gm.	25 oz. av.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Fluid Extracts, evaporate them, in a tared capsule, on a water-bath, to 100 Gm. [old form 3 fl. oz.], and mix the residue with 350 C.c. [old form 11 fl. oz.] of Water. When the mixture is cold, incorporate with it, intimately, the Precipitated Calcium Phosphate, filter, pass enough Water through the filter to obtain 400 C.c. [old form 12 fl. oz. 6½ fl. dr.] of filtrate, and add to this the Antimony and Potassium Tartrate dissolved in 25 C.c. [old form 6 fl. dr.] of hot Water. Dissolve the Sugar in this liquid by agitation, without heat, strain, and add enough Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Compound Syrup of Squill may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula, and mixed with the solution of Antimony and Potassium Tartrate, upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS SENEGÆ. U. S. Syrup of Senega.

	Metric.	Old form.
Fluid Extract of Senega	200 C.c.	6 fl. oz. 192 min.
Ammonia Water	5 C c.	76 minims.
Sugar	700 Gm.	23 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Fluid Extract of Senega with 300 C.c. [old form 9½ fl. oz.] of Water and with the Ammonia Water, and set the mixture aside for a few hours. Then filter, and pass enough Water through the filter to obtain 550 C.c. [old form 17½ fl. oz.]. In the filtrate dissolve the Sugar by agitation, without heat, strain, and add enough Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Syrup of Senega may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS SENNÆ. U. S. Syrup of Senna.

	Metric.	Old form.
Senna (Alexandria), bruised	250 Gm.	8 oz. av. 150 gr.
Oil of Coriander	5 C.c.	76 minims.
Alcohol	150 C.c.	4 fl. oz. 6½ fl. dr.
Sugar	700 Gm.	23 oz. av. 160 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Senna add 700 C.c. [old form 22½ fl. oz.] of boiling Water, and digest, at a temperature not exceeding 60° C. (140° F.), during twenty-four hours. Then express the liquid, and pass enough Water through the residue to obtain 600 C.c. [old form 19 fl. oz.] of liquid. Strain this, and, when it is cold, mix it with the Alcohol in which the Oil of Coriander had previously been dissolved. Set it aside until the precipitate has subsided, then pour off the clear liquid, filter the remainder, and pass enough Water through the filter to obtain 550 C.c. [old form 17½ fl. oz.]. In the filtrate dissolve the Sugar by agitation, without heat, strain, and add enough Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS TOLUTANUS. U. S. Syrup of Tolu.

	Metric.	Old form.
Balsam of Tolu	10 Gm.	146 grains.
Precipitated Calcium Phosphate	50 Gm.	1 oz. av. 300 gr.
Sugar	850 Gm.	28 oz. av. 164 gr.
Alcohol	50 C.c.	1 fl. oz. 5 fl. dr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Balsam of Tolu in the Alcohol, in a small flask or bottle, with the aid of a gentle heat. Mix the Precipitated Calcium Phosphate with 150 Gm. [old form 5 oz. av.] of the Sugar, in a mortar, thoroughly incorporate with it the solution of the Balsam, and set

the mortar aside, in a moderately warm place, until the Alcohol has evaporated. Then triturate the residue well with 500 C.c. [old form 1 pint] of Water, gradually added, and filter the mixture through a wetted filter, returning the first portions of the filtrate until it runs through clear. To the filtrate, heated to a temperature of about 60° C. (140° F.), add the remainder of the Sugar, and dissolve it by agitation. Then allow the Syrup to cool, strain it, and pass enough Water through the filter and strainer to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Syrup of Tolu may also be made in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

SYRUPUS ZINGIBERIS. U. S. Syrup of Ginger.

	Metric.	Old form.
Fluid Extract of Ginger	30 C.c.	460 minims.
Precipitated Calcium Phosphate	15 Gm.	220 grains.
Sugar	850 Gm.	28 oz. av. 164 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Triturate the Fluid Extract of Ginger with the Precipitated Calcium Phosphate, and expose the mixture in a warm place until the Alcohol has evaporated. Then triturate the residue with 450 C.c. [old form 14½ fl. oz.] of Water, and filter. In the filtrate dissolve the Sugar by agitation, without heat, strain, and pass enough Water through the filter to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

Syrup of Ginger may also be prepared in the following manner:

Prepare a percolator or funnel in the manner described under Syrup (see *Syrupus*). Pour the filtrate obtained as directed in the preceding formula upon the Sugar, return the first portions of the percolate, until it runs through clear, and, when all the liquid has passed, follow it by Water, until the product measures 1000 C.c. [old form 2 pints]. Mix thoroughly.

Mellita. Honey.

Official honeys are thick liquid preparations closely allied to the syrups, differing merely in the use of honey as a base, instead of syrup. Their advantages over syrups are not very apparent, particularly since of late years the difficulty of obtaining pure honey has greatly increased. Three honeys are official.

Official Honey.

Name.	Proportions and definition.	Preparation.
Mel.	Commercial Honey.	A saccharine secretion deposited in the honeycomb by <i>Apis mellifica</i> .
Mel Despumat.	Clarified Honey.	Heat Honey, mixed with paper-pulp, over a water-bath, remove the scum and strain; then mix with five per cent. of its weight of Glycerin.
Mel Rosæ.	120 C.c. Fluid Extract of Rose, and enough Clarified Honey to make 1000 Gm.	Mix thoroughly.

MEL DESPUMATUM. U. S. Clarified Honey.

Honey, a convenient quantity.

Glycerin, a sufficient quantity.

Mix the Honey intimately with 2 per cent. of its weight of paper-pulp, which has been previously reduced to shreds, thoroughly washed and soaked in water, and then strongly expressed and again shredded. Then apply the heat of a water-bath, and, as long as any scum rises to the surface, carefully remove this. Finally, add enough Distilled Water to make up the loss incurred by evaporation, strain, and mix the strained liquid with 5 per cent. of its weight of glycerin.

MEL ROSÆ. U. S. Honey of Rose.

	Metric.	Old form.
Fluid Extract of Rose	120 C.c.	5 fl. oz.
Clarified Honey, a sufficient quantity,		
To make	1000 Gm.	2 pints.

Into a tared vessel introduce the Fluid Extract of Rose, then add enough Clarified Honey to make the contents weigh 1000 Gm. [or to measure, old form, 2 pints], and mix them thoroughly.

Mucilagines. *Mucilages.*

The official mucilages are thick, viscid, adhesive liquids, produced by dissolving gum in water, or by extracting with water the mucilaginous principles from vegetable substances. There are *four* official mucilages. *Two* are made without the application of heat, and *two* with heat. The mucilages are all prone to decomposition, and should never be made in larger quantities than can be used at once.

Official Mucilages.

Name.	Proportions.	Process.
Mucilago Acaciæ.	840 Gm. Acacia; Water sufficient to make 1000 Gm.	Without heat. { Wash the Acacia with cold water; then add to it 660 Gm. of Water; agitate until dissolved, and strain. Macerate for 8 hours, and strain.
Mucilago Sassafras Medullæ.	2 Gm. Sassafras Pith; Water to make 100 C.c.	
Mucilago Tragacanthæ.	6 Gm. Tragacanth; 18 Gm. Glycerin; Water sufficient to make 100 Gm.	With heat. { Mix the Glycerin with 75 C.c. Water, heat to boiling, add the Tragacanth, macerate for 24 hours with stirring. Then add enough Water to make the mixture weigh 100 Gm.; strain forcibly through muslin. Digest the Elm with the Water, on a water-bath, in a covered vessel, during one hour, then strain.
Mucilago Ulmi.	6 Gm. Elm; Water 100 C.c.	

MUCILAGO ACACIÆ. U. S. Mucilage of Acacia.

	Metric.	Old form.
Acacia, in small fragments	340 Gm.	18 oz. av.
Water, a sufficient quantity,		
To make	1000 Gm.	2 pints.

Wash the Acacia with cold Water, and let it drain. Then add to it enough Water to make the mixture weigh 1000 Gm. [or measure, old form, 2 pints], agitate or stir occasionally until the Acacia is dissolved, and strain. Keep the product in well-stoppered, completely filled bottles, in a cool place.

MUCILAGO SASSAFRAS MEDULLÆ. U. S. Mucilage of Sassafras Pith.

	Metric.	Old form.
Sassafras Pith	2 Gm.	80 grains.
Water	100 C.c.	8 fl. oz.

Macerate the Sassafras Pith in the Water during three hours, and strain.

This preparation should be freshly made, when wanted.

MUCILAGO TRAGACANTHÆ. U. S. Mucilage of Tragacanth.

	Metric.	Old form.
Tragacanth	6 Gm.	90 grains.
Glycerin	18 Gm.	$\frac{1}{2}$ fl. oz.
Water, a sufficient quantity,		
To make	100 Gm.	about 4 fl. oz.

Mix the Glycerin with 75 C.c. [old form 2 $\frac{1}{2}$ fl. oz.] of Water in a tared vessel, heat the mixture to boiling, add the Tragacanth, and let it

macerate during twenty-four hours, stirring occasionally. Then add enough Water to make the mixture weigh 100 Gm. [or measure, old form, about 4 fl. oz.], beat it so as to make it of uniform consistence, and strain it forcibly through muslin.

MUCILAGO ULMI. U. S. Mucilage of Elm.

	Metric.	Old form.
Elm, bruised	6 Gm.	87 grains.
Water	100 C.c.	3 fl. oz.

Digest the Elm with the water, on a water-bath, in a covered vessel, during one hour, then strain.

This preparation should be freshly made, when wanted.

Emulsa. Emulsions.

The U. S. Pharmacopœia of 1890 introduced emulsions as a separate class of preparations: formerly they were included under the general heading of *Misturæ*. The necessity for differentiation in nomenclature, as preparations of established merit multiply, is apparent. Emulsions are aqueous liquids in which oleaginous substances are suspended by the intervention of gum, yolk of egg, or other viscid matter. Their method of preparation is fully considered under Part VI., *Extemporaneous Liquids*. There are *four* official emulsions.

Table of Official Emulsions.

Name.	Proportions.	Description.
Emulsum Ammoni- aci.	40 Gm. Ammoniac with 1000 C.c. Water.	Simple gum-resin emulsions.
Emulsum Asafœ- tidæ.	40 Gm. Asafetida with 1000 C.c. Water.	
Emulsum Amyg- dalæ.	60 Gm. Sweet Almond; 10 Gm. Acacia; 80 Gm. Sugar; Water sufficient to make 1000 C.c.	Simple seed emul- sion.
Emulsum Chloro- formi.	40 C.c. Chloroform; 60 C.c. Expressed Oil of Almond; 15 Gm. Tragacanth; Water to make 1000 C.c.	Tragacanth emul- sion.

EMULSUM AMMONIACI. U. S. Emulsion of Ammoniac.

[MISTURA AMMONIACI, PHARM. 1880.]

	Metric.	Old form.
Ammoniac	40 Gm.	146 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	8 fl. oz.

Rub the Ammoniac, in a warmed mortar, with 900 C.c. [old form 7 fl. oz.] of Water, at first very gradually added, until a uniform emulsion results. Then strain the mixture into a graduated vessel, and wash the mortar and strainer with enough Water to make the product measure 1000 C.c. [old form 8 fl. oz.].

EMULSUM AMYGDALÆ. U. S. Emulsion of Almond.

[MISTURA AMYGDALÆ, PHARM. 1890. MILK OF ALMOND.]

	Metric.	Old form.
Sweet Almond	60 Gm.	219 gr.
Acacia, in fine powder	10 Gm.	87 gr.
Sugar	30 Gm.	109 gr.
Water, a sufficient quantity,		
To make	1000 C.c.	8 fl. oz.

Having blanched the Almond, add the Acacia and Sugar, and beat them, in a mortar, until they are thoroughly mixed. Then rub the mass with 900 C.c. [old form 7 fl. oz.] of Water, at first very gradually added, until a uniform mixture results. Strain this into a graduated vessel, and wash the mortar and strainer with enough Water to make the product measure 1000 C.c. [old form 8 fl. oz.]. Mix the whole thoroughly.

EMULSUM ASAFETIDÆ. U. S. Emulsion of Asafetida.

[MISTURA ASAFETIDÆ, PHARM. 1890. MILK OF ASAFETIDA.]

	Metric.	Old form.
Asafetida, in selected tears	40 Gm.	146 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	8 fl. oz.

Rub the Asafetida, in a warmed mortar, with 900 C.c. [old form 7 fl. oz.] of Water, at first very gradually added, until a uniform emulsion results. Then strain the mixture into a graduated vessel, and wash the mortar and strainer with enough Water to make the product measure 1000 C.c. [old form 8 fl. oz.]. Mix the whole thoroughly.

EMULSUM CHLOROFORMI. U. S. Emulsion of Chloroform.

[MISTURA CHLOROFORMI, PHARM. 1890.]

	Metric.	Old form.
Chloroform	40 C.c.	158 minims.
Expressed Oil of Almond	60 C.c.	230 minims.
Tragacanth, in very fine powder	15 Gm.	55 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	8 fl. oz.

Introduce the Tragacanth into a perfectly dry bottle of sufficient capacity, add the Chloroform, and shake the bottle thoroughly, so that every part of the surface may become wetted. Then add about 250 C.c. [old form 2 fl. oz.] of Water, and incorporate it by vigorous shaking. Next add the Expressed Oil of Almond, in several portions, shaking after each addition, and when the Oil has been thoroughly emulsified, add enough Water, in divided portions, shaking after each addition, until the product measures 1000 C.c. [old form 8 fl. oz.].

Misturæ. Mixtures.

Mixtures, in a properly restricted sense, are aqueous liquid preparations intended for internal use, which contain suspended insoluble sub-

stances. The main object in introducing this class into the Pharmacopœia was to secure uniformity in the formulas of certain well-known and largely-used preparations. They are not permanent, as a rule, and it is not wise to keep them on hand any considerable length of time. They belong properly under the head of Extemporaneous Preparations. (See Mixtures, Part VI.) There are *four* official mixtures.

Table of Official Mixtures.

Name.	Proportions.	Description.
Mistura Cretæ.	200 Gm. Compound Chalk Powder; 400 C.c. Cinnamon Water; Water, to make 1000 C.c.	Mixtures containing insoluble powder in suspension.
Mistura Ferri Composita.	6 Gm. Ferrous Sulphate; 8 Gm. Potassium Carbonate; 18 Gm. Myrrh; 18 Gm. Sugar; 60 C.c. Spirit of Lavender; Rose Water, to make 1000 C.c.	
Mistura Glycyrrhizæ Composita.	80 Gm. Pure Extract of Glycyrrhiza; 50 C.c. Syrup; 100 C.c. Mucilage of Acacia; 120 C.c. Camphorated Tincture of Opium; 60 C.c. Wine of Antimony; 30 C.c. Spirit of Nitrous Ether; Water, to make 1000 C.c.	
Mistura Rhei et Sodæ.	85 Gm. Sodium Bicarbonate; 15 C.c. Fluid Extract of Rhubarb; 8 C.c. Fluid Extract of Ipecac; 850 C.c. Glycerin; 85 C.c. Spirit of Peppermint; Water, to make 1000 C.c.	Mixture not containing insoluble powders in suspension.

MISTURA CRETÆ. U.S. Chalk Mixture.

	Metric.	Old form.
Compound Chalk Powder	200 Gm.	865 grains.
Cinnamon Water	400 C.c.	1½ fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	4 fl. oz.

Rub the Compound Chalk Powder, in a mortar, with the Cinnamon Water and about 200 C.c. [old form 6 fl. dr.] of Water gradually added, to a uniform mixture; transfer this to a graduated vessel, and rinse the mortar with enough Water to make the product measure 1000 C.c. [old form 4 fl. oz.]. Mix the whole thoroughly.

This preparation should be freshly made, when wanted.

MISTURA FERRI COMPOSITA. U.S. Compound Iron Mixture.

[GRIFFITH'S MIXTURE.]

	Metric.	Old form.
Ferrous Sulphate, in clear crystals	6 Gm.	11 grains.
Myrrh, in small pieces	18 Gm.	33 grains.
Sugar	18 Gm.	33 grains.
Potassium Carbonate	8 Gm.	15 grains.
Spirit of Lavender	60 C.c.	2 fl. dr.
Rose Water, a sufficient quantity,		
To make	1000 C.c.	4 fl. oz.

Rub the Myrrh, Sugar, and Potassium Carbonate, in a mortar with 700 C.c. [old form 2½ fl. oz.] of Rose Water, at first very gradually added, so that a uniform mixture may result. Transfer this to a graduated vessel, add the Spirit of Lavender, then the Ferrous Sulphate, previously dissolved in about 50 C.c. [old form 1½ fl. dr.] of Rose Water, and, lastly, enough Rose Water to make the product measure 1000 C.c. [old form 4 fl. oz.]. Mix the whole thoroughly.

This preparation should be freshly made, when wanted.

MISTURA GLYCYRRHIZÆ COMPOSITA. U. S. Compound Mixture of Glycyrrhiza.

[BROWN MIXTURE.]

	Metric.	Old form.
Pure Extract of Glycyrrhiza	30 Gm.	488 grains.
Syrup	50 C.c.	1½ fl. oz.
Mucilage of Acacia	100 C.c.	8 fl. oz.
Camphorated Tincture of Opium	120 C.c.	8 fl. oz. 7. fl. dr.
Wine of Antimony	60 C.c.	2 fl. oz.
Spirit of Nitrous Ether	30 C.c.	1 fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Rub the Pure Extract of Glycyrrhiza, in a mortar, with 500 C.c. [old form 16 fl. oz.] of Water, until it is dissolved. Transfer the solution to a graduated vessel containing the other ingredients, and rinse the mortar with enough Water to make the product measure 1000 C.c. [old form 2 pints]. Mix the whole thoroughly.

MISTURA RHEI ET SODÆ. U. S. Mixture of Rhubarb and Soda.

	Metric.	Old form.
Sodium Bicarbonate	35 Gm.	511 grains.
Fluid Extract of Rhubarb	15 C.c.	4 fl. dr.
Fluid Extract of Ipecac	3 C.c.	46 minims.
Glycerin	350 C.c.	11 fl. oz.
Spirit of Peppermint	35 C.c.	1 fl. oz. 1 fl. dr.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Sodium Bicarbonate in about 400 C.c. [old form 13 fl. oz.] of Water. Then add the Fluid Extracts, the Glycerin, and the Spirit of Peppermint, and, lastly, enough Water, to make 1000 C.c. [old form 2 pints].

Glycerita. Glycerites.

Glycerites are mixtures of medicinal substances with glycerin. Glycerin is a valuable solvent; and one of the principal advantages of the glycerites is that they afford a rapid and simple method of making aqueous solutions of substances which are not otherwise easily soluble. The solutions of carbolic acid, gallic acid, tannic acid, and tar, etc., in glycerin are permanent preparations, and they could be made very concentrated if necessary: the ease with which they can be diluted with

water or alcohol, without precipitation, renders such glycerites especially useful at the prescription counter. *Two* old glycerites and *two* new ones were made official in the U. S. P. 1890. The old glycerites of carbolic acid and tannic acid were inadvertently omitted from the U. S. P. 1880. The new glycerites of boroglycerin and hydrastis are largely used, and they merit a place in the Pharmacopœia.

Official Glycerites.

Name.	Proportion.
Glyceritum Acidi Carbolic.	Carbolic Acid, 20 Gm.; Glycerin, 80 Gm.
Glyceritum Acidi Tannici.	Tannic Acid, 20 Gm.; Glycerin, 80 Gm.
Glyceritum Amyli.	Starch, 10 Gm.; Glycerin, 80 Gm.; Water, 10 C.c. (A translucent jelly.)
Glyceritum Boroglycerini.	Boric Acid, 81 Gm.; Glycerin, 69 Gm.
Glyceritum Hydrastis.	Hydrastis, 1000 Gm.; Glycerin, 500 C c.; Alcohol and Water, to make 1000 C c.
Glyceritum Vitelli.	45 Gm. Fresh Yolk of Egg; 55 Gm. Glycerin.

GLYCERITUM ACIDI CARBOLICI. U. S. Glycerite of Carbolic Acid.

	Metric.	Old form.
Carbolic Acid	20 Gm.	4 oz. av.
Glycerin	80 Gm.	16 oz. av.
To make	100 Gm.	20 oz. av.

Weigh the Carbolic Acid and Glycerin, successively, into a tared capsule, and stir them together until the Acid is dissolved. Then transfer the solution to a bottle. (This glycerite may be made by measure by dissolving 4 oz. av. of Carbolic Acid in enough Glycerin to make one pint.)

GLYCERITUM ACIDI TANNICI. U. S. Glycerite of Tannic Acid.

	Metric.	Old form.
Tannic Acid	20 Gm.	4 oz. av.
Glycerin	80 Gm.	16 oz. av.
To make	100 Gm.	20 oz. av.

Weigh the Tannic Acid and Glycerin, successively, into a tared porcelain capsule, avoiding contact with metallic utensils, and apply the heat of a water-bath, until the Acid is completely dissolved. Then transfer the solution to a bottle. (This glycerite may be made by measure by dissolving 4 oz. of Tannic Acid in enough Glycerin to make one pint. Heat facilitates the solution.)

GLYCERITUM AMYLI. U. S. Glycerite of Starch.

	Metric.	Old form.
Starch	10 Gm.	290 grains.
Water	10 C.c.	5 fl. dr.
Glycerin	80 Gm.	4 fl. oz.

To the Starch, contained in a porcelain capsule, add the Water and Glycerin, and stir until a homogeneous mixture is produced. Then

apply a heat gradually raised to 140° C. (284° F.), and not exceeding 144° C. (291° F.), stirring constantly, until a translucent jelly is formed.

Transfer the product to suitable vessels, provided with well-fitting covers.

GLYCERITUM BOROGLYCERINI. U. S. Glycerite of Boroglycerin.

[GLYCERITE OF GLYCERYL BORATE. SOLUTION OF BOROGLYCERIDE.]

	Metric.	Old form.
Boric Acid, in fine powder	310 Gm.	5 oz. av.
Glycerin, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Heat 460 Gm. [old form 7 oz. av. 158 gr.] of Glycerin, in a tared porcelain capsule, to a temperature not exceeding 150° C. (302° F.), and add the Boric Acid in portions, constantly stirring. When all is added and dissolved, continue the heat at the same temperature, frequently stirring, and breaking up the film which forms on the surface. When the mixture has been reduced to the weight of 500 Gm. [old form 8 oz. av.], add to it 500 Gm. [old form 8 oz. av.] of Glycerin, mix thoroughly, and transfer it to suitable vessels.

GLYCERITUM HYDRASTIS. U. S. Glycerite of Hydrastis.

	Metric.	Old form.
Hydrastis, in No. 60 powder	1000 Gm.	25 oz. av.
Glycerin	500 C.c.	12 fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	24 fl. oz.

Moisten the Hydrastis with 350 C.c. [old form 8½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol until the Hydrastis is practically exhausted. To the percolate add 250 C.c. [old form 6 fl. oz.] of Water, and then drive off the Alcohol by evaporation or distillation. After the Alcohol is driven off, add enough Water to the residue to make it measure 500 C.c. [old form 12 fl. oz.], and set it aside for twenty-four hours. Then filter, pass enough Water through the filter to make the filtrate measure 500 C.c. [old form 12 fl. oz.], add the Glycerin, and mix thoroughly.

GLYCERITUM VITELLI. U. S. Glycerite of Yolk of Egg.

[GLYCONIN.]

	Metric.	Old form.
Fresh Yolk of Egg	45 Gm.	140 grains.
Glycerin	55 Gm.	170 grains.
To make	100 Gm.	310 grains.

Rub the Yolk of Egg, in a mortar, with the Glycerin, gradually added, until they are thoroughly mixed. Then transfer the mixture to a bottle.

QUESTIONS ON CHAPTER XXII.

AQUEOUS SOLUTIONS CONTAINING SWEET OR VISCID SUBSTANCES.

- What are syrups?
- What kinds of sugar should be used in making syrups?
- How many methods of making syrups are recognized by the U. S. P.?
- Describe the details for making syrups by heat. For making syrups without heat.
- What objection is there to making syrups by the addition of fluid extracts, tinctures, etc., to syrup?
- What official syrup is made by digestion?
- Is this method a satisfactory one?
- What method would be preferable?
- What official syrup is made by maceration?
- How is it made?
- How is the process of percolation in making syrups conducted?
- What precautions are necessary to percolate a syrup successfully?
- How may syrups be preserved?
- Is the addition of alcohol or chemicals objectionable? Why?
- What is the best disposition to make of fermented syrups?
- How may fruit juices be effectually preserved?
- How many official syrups are there?
- Name the official syrups made by solution with heat.
- Which of these are made by solution involving chemical action?
- How many are made by the simple addition of medicating liquid to syrup?
- Name them.
- Which of these are made with mucilage?
- Which with flavored acidulated solution?
- Which with aromatic tincture?
- Which with fluid extract?
- Name the official syrups, made by the agitation of sugar with medicating liquid without heat.
- Which of these contain acetic acid?
- How many are made from cold aqueous infusion? Name them.
- Which one is made by infusion? Which one is made by digestion?
- Which from emulsion? Which from juice?
- Which three from medicated water from tincture?
- Which from medicated water from fluid extract?
- How many are made from simple admixture or solution? Name them.
- Which two are made from solution involving chemical reaction?
- How many are made by maceration or digestion? Name them.
- Give the formula and mode of preparing Syrupus.
- What is its specific gravity?
- How is syrup of acacia made?
- Does this syrup keep well?
- Give the formula and mode of making syrup of citric acid.
- What is the formula in symbols of hydriodic acid?
- What is its molecular weight?
- How is syrup of hydriodic acid made?
- How much hydriodic acid does it contain?
- What is the specific gravity of the syrup?
- How may the presence of free iodine in the syrup be detected? Of sulphuric acid?
- Of hydrochloric acid?
- What is the strength of syrup of garlic, and how is it made?
- Give the process for making syrup of althaea. Syrup of almond. Syrup of orange.
- What are the ingredients used in making the syrup of lactophosphate of calcium?
- Give an outline of the process for making it.
- Write out in full the Latin name.
- How is syrup of lime prepared?
- What is the formula in symbols of ferrous iodide?
- What is its molecular weight?

- How is the syrup of ferrous iodide prepared?
 How much ferrous iodide does it contain?
 Describe the appearance and physical characters of this syrup.
 What colored precipitate does it yield with test-solution of potassium ferricyanide?
 Of what does this indicate the presence?
 How may the presence of free iodine be detected?
 Write out in full the Latin name of the "syrup of the phosphates of iron, quinine, and strychnine."
- What are the ingredients used in making this syrup?
 Give an outline of the process for making it.
 Of what hypophosphites does the syrup of hypophosphites consist?
 How is the syrup prepared?
 What preparation of iron is contained in the syrup of hypophosphites with iron?
 How is this syrup prepared?
 Write out its name in full.
 How is syrup of ipecac made?
 How much ipecac is there in two and a half troy ounces?
 About how much in a fluidounce?
 Write out the Latin name in full.
 Give the formula for syrup of krameria. For syrup of lactucarium.
 Write out in full the Latin name of syrup of tar.
 How much tar is used to make one hundred parts of the syrup?
 How is the syrup made?
 Write out in full the Latin name of syrup of wild cherry.
 How much wild cherry is used to make one hundred parts?
 What degree of fineness is directed for the powder?
 How is the syrup made?
 How much glycerin does it contain?
 Give the formula for syrup of rhubarb.
 How is the syrup made?
 Give the formula and mode of preparing the aromatic syrup of rhubarb.
 Give the formula for syrup of rose. For syrup of rubus.
 How is the syrup of raspberry prepared?
 What are the ingredients of compound syrup of sarsaparilla?
 How is the syrup prepared?
 Give the formula and mode of preparing syrup of squill.
 What are the ingredients of compound syrup of squill?
 How is this syrup prepared?
 How much antimony and potassium tartrate is there in a troy ounce?
 Give the formula and mode of making syrup of senega.
 What aromatic is used in making syrup of senna?
 How is the syrup of senna made?
 How much senna is there in one hundred parts of syrup?
 Give the formula and mode of making syrup of tolu.
 How is syrup of ginger made?
 What is the strength of it?
 What are official emulsions, and how many are there? Name them.
 What were these preparations called in the previous U. S. P.?
 Give the formula and mode of making emulsion of ammoniac. Emulsion of almond. Emulsion of asafetida. Chloroform.
 What is the popular name or synonyme of emulsion of asafetida?
 What are official honeys? How many are there? Name them.
 Give the Latin name and mode of preparing commercial honey. Clarified honey.
 Honey of rose.
 What are official mucilages, and how many are there?
 How many mucilages are prepared without heat? Name them.
 How is mucilage of acacia prepared?
 Give the Latin name, formula, and mode of making mucilage of sassafras pith.
 Mucilage of tragacanth. Mucilage of elm.
 What are official mixtures, and how many are there?
 Give the Latin name, formula, and mode of making chalk mixture.
 Should chalk mixture be kept on hand?
 What is the Latin name of compound iron mixture?
 What is the popular name or synonyme of compound iron mixture?
 Why is myrrh in small pieces preferable to the powder?

Give the formula and mode of preparing it.

In what form does the iron exist in the finished mixture?

Should the mixture be freshly made?

What change takes place on keeping?

How many contain insoluble powder in suspension? Name them.

How many do not contain insoluble powder in suspension? Name them.

Give the Latin name, formula, and mode of preparing mixture of rhubarb and soda.

What are glycerites, and how many are official? Name them.

Give the formula and mode of making glycerite of starch. Glycerite of carbolic acid. Glycerite of tannic acid. Glycerite of boroglycerin. Glycerite of hydrastis. Glycerite of yolk of egg.

Write out in full the Latin name of this preparation.

What is the popular name or synonyme?

CHAPTER XXIII.

ALCOHOLIC SOLUTIONS.

Spiritus. *Spirits.*

SPIRITS from a pharmaceutical point of view are simply *alcoholic* solutions of volatile substances. Like the medicated waters, the active ingredient may be solid, liquid, or gaseous. None are made by percolation, but they are officially prepared in five ways: 1. By simple solution. 2. By solution with maceration. 3. By gaseous solution. 4. By chemical reaction. 5. By distillation. The number of official spirits is *twenty-five*.

1. By Simple Solution.—This is the most usual method of making spirits: of the official preparations of this class *eighteen*, or three-fourths of the whole number, are prepared in this way, whilst *ten* of these eighteen are merely solutions of volatile oils in alcohol of different strengths, without any other addition. No skill is required to make these, but a great deal of conscientious care must be used in the selection of the volatile oil, that it be of the best quality and recently distilled. Filtration is usually unnecessary.

SPIRITUS. *U. S. P.*

Spirits made by Simple Solution.

Name.	Proportion.	Uses and Dose.
Spiritus <i>Ætheris</i> .	825 C.c. Ether; 675 C.c. Alcohol.	Stimulant, fʒi to fʒiij.
Spiritus <i>Ætheris</i> Compositus.	825 C.c. Ether; 650 C.c. Alcohol; 25 C.c. Ethereal Oil.	Anodyne, stimulant, 80 to 60m.
Spiritus <i>Ammonia</i> Aromaticus.	84 Gm. Ammonium Carbonate; 90 C.c. Ammonia Water; 10 C.c. Oil of Lemon; 1 C.c. Oil of Lavender Flowers; 1 C.c. Oil of Nutmeg; 700 C.c. Alcohol; Distilled Water, to make 1000 C.c.	Antacid, 80 to 60m.
Spiritus <i>Amygdalæ</i> Amara.	10 C.c. Oil of Bitter Almond; 800 C.c. Alcohol; Distilled Water, to make 1000 C.c.	Flavor, 1 to 2m.
Spiritus <i>Anisi</i> .	100 C.c. Oil of Anise; 900 C.c. Deodorized Alcohol.	Carminative, fʒi.
Spiritus <i>Aurantii</i> .	50 C.c. Oil of Orange Peel; 950 C.c. Deodorized Alcohol.	Flavor.
Spiritus <i>Aurantii</i> Compositus.	200 C.c. Oil of Orange Peel; 50 C.c. Oil of Lemon; 20 C.c. Oil of Coriander; 5 C.c. Oil of Anise; Deodorized Alcohol, sufficient to make 1000 C.c.	Flavor.

Spirits made by Simple Solution.—(Continued.)

Name.	Proportion.	Uses and Dose.
<i>Spiritus Camphoræ.</i>	100 Gm. Camphor; Alcohol, sufficient to make 1000 C.c.	Stimulant, 5 to 60m.
<i>Spiritus Chloroformi.</i>	60 C.c. Chloroform; 940 C.c. Alcohol.	Sedative, stimulant, 10 to 60m.
<i>Spiritus Cinnamomi.</i>	100 C.c. Oil of Cinnamon; 900 C.c. Alcohol.	Stimulant, 5 to 15m.
<i>Spiritus Gaultheriæ.</i>	50 C.c. Oil of Gaultheria; 950 C.c. Alcohol.	Flavor, 5 to 15m.
<i>Spiritus Glonoini.</i>	1 Gm. Nitroglycerin to 99 Gm. Alcohol.	Cardiac stimulant, 1 to 2m.
<i>Spiritus Juniperi.</i>	50 C.c. Oil of Juniper; 950 C.c. Alcohol.	Stimulant, diuretic, fʒi to fʒij.
<i>Spiritus Juniperi Compositus.</i>	8 C.c. Oil of Juniper; 1 C.c. Oil of Caraway; 1 C.c. Oil of Fennel; 1400 C.c. Alcohol; Water, sufficient to make 2000 C.c.	Stimulant, diuretic, fʒij to fʒiv.
<i>Spiritus Lavandulæ.</i>	50 C.c. Oil of Lavender Flowers; 950 C.c. Deodorized Alcohol.	Flavor, fʒas to fʒi.
<i>Spiritus Myrciæ.</i>	16 C.c. Oil of Myrcia; 1 C.c. Oil of Orange Peel; 1 C.c. Oil of Pimenta; 1220 C.c. Alcohol; Water, sufficient to make 2000 C.c.	Externally.
<i>Spiritus Myristicæ.</i>	50 C.c. Oil of Nutmeg; 950 C.c. Alcohol.	Flavor, fʒas to fʒi.
<i>Spiritus Phosphori.</i>	1.2 Gm. Phosphorus; Absolute Alcohol, sufficient to make 1000 C.c.	To make Elixir of Phosphorus.

2. Solution with Maceration.—This method is employed solely in the Pharmacopœia when it is desirable to introduce the coloring-matter of the drug into the preparation. This has been done in order to bestow individuality, and in deference to popular feeling in favor of high colors. It is very doubtful whether either object is worthy of consideration.

Spirits made by Solution with Maceration.

Name.	Preparation.	Uses and Dose.
<i>Spiritus Limonis.</i>	50 C.c. Oil of Lemon; 50 Gm. Lemon Peel, fresh; Deodorized Alcohol, to make 1000 C.c.	For flavoring.
<i>Spiritus Menthæ Piperitæ.</i>	100 C.c. Oil of Peppermint; 10 Gm. Peppermint, bruised; Alcohol, to make 1000 C.c.	Carminative, 10 to 20m.
<i>Spiritus Menthæ Viridis.</i>	100 C.c. Oil of Spearmint; 10 Gm. Spearmint, bruised; Alcohol, to make 1000 C.c.	Carminative, 10 to 20m.

3. By Gaseous Solution.—The only official representative of this class is the spirit of ammonia, and it is the only preparation in the Pharmacopœia that is made by converting a gaseous aqueous solution into a gaseous alcoholic solution by expelling the dissolved gas from water by heat and causing it to be redissolved in alcohol. The spirit

is assayed by volumetric solution of sulphuric acid, and brought to the standard strength of 10 per cent. of gaseous ammonia.

Spirit made by Gaseous Solution.

Name.	Preparation.	Use and Dose.
Spiritus Ammonise.	Stronger Water of Ammonia; Heat; Alcohol; 10 p.c. Gas; assay.	Stimulant, 5 to 80m.

4. By Chemical Reaction.—There is but *one* spirit in the Pharmacopœia made by chemical reaction, and that is spirit of nitrous ether. As explained elsewhere (Part IV.), it is the product of the action of nitric acid upon alcohol, and is an alcoholic solution of ethyl nitrite.

Spirit made by Chemical Reaction.

Name.	Preparation.	Use and Dose.
Spiritus Ætheris Nitrosi.	About 4 p.c. Ethyl Nitrite.	Diaphoretic, diuretic, fʒss to fʒi.

5. By Distillation.—This method of making spirits is the oldest and in many respects the best in use. When the desirable volatile principles which are present in the preparation when finished can be vaporized at the temperature of boiling alcohol or diluted alcohol, distillation is preferred. In the case of liquids containing some oils of high boiling-points, it is necessary to obtain the oils by distillation with water and afterwards mix the distillate with alcohol. It is certain, however, that spirits made by the admixture of volatile oils with alcohol, as in Class 1, are often deficient in the more delicate and volatile principles found in the substances from which they are distilled. These principles are often soluble in water and insoluble in the oil, and necessarily in the distillation of the volatile oil with water they must be found in the water, and are absent from the oil. This is well illustrated in the case of oil of neroli and orange flower water: the latter has much the more fragrant odor when compared with the oil obtained in the same distillation from the same flowers and subjected to the same temperature. The only official spirits made by distillation are *two* in number, —whiskey and brandy.

Spirits made by Distillation.

Name.	Preparation.	Use and Dose.
Spiritus Frumenti.	By distillation from fermented grain; must be at least 2 years old.	Stimulant, fʒss to fʒi.
Spiritus Vini Gallici.	By distillation from fermented grapes; must be at least 4 years old.	Stimulant, fʒss to fʒi.

PRACTICAL PROCESSES FOR OFFICIAL SPIRITS.

SPIRITUS ÆTHERIS. U. S. Spirit of Ether.

	Metric.	Old form.
Ether	325 C.c.	4 fl. oz.
Alcohol	675 C.c.	8½ fl. oz.
To make	1000 C.c.	12½ fl. oz.

Mix them.

SPIRITUS ÆTHERIS COMPOSITUS. U. S. Compound Spirit of Ether.
[HOFFMANN'S ANODYNE.]

	Metric.	Old form.
Ether	325 C.c.	8 fl. oz.
Alcohol	650 C.c.	16 fl. oz.
Ethereal Oil	25 C.c.	5 fl. dr.
To make	1000 C.c.	24½ fl. oz.

Mix them.

SPIRITUS ÆTHERIS NITROSI. U. S. Spirit of Nitrous Ether.

An alcoholic solution of Ethyl Nitrite [$C_2H_5NO_2 = 74.87$], yielding, when freshly prepared, and tested in a nitrometer, not less than 11 times its own volume of Nitrogen Dioxide [$NO = 29.97$].

	Metric.	Old form.
Sodium Nitrite	770 Gm.	5 oz. av. 190 gr.
Sulphuric Acid	520 Gm.	8 oz. av. 292 gr.
Sodium Carbonate	10 Gm.	81 grains.
Potassium Carbonate, completely deprived of water by drying	30 Gm.	98 grains.
Deodorized Alcohol, Water, each, a sufficient quantity.		

Dissolve the Sodium Nitrite in 1000 C.c. [old form 6 fl. oz. 6 fl. dr.] of Water, and put the solution into a suitable flask, connected with a condenser kept cold by ice-cold water; then add 550 C.c. [old form 3 fl. oz. 6 fl. dr.] of Deodorized Alcohol, and mix well. Through a cork fitted into the mouth of the flask insert a funnel-tube dipping below the surface of the liquid. With the condenser connect a receiver, and keep this surrounded by a mixture of common salt and crushed ice. Then gradually introduce into the flask, through the funnel-tube, the Sulphuric Acid previously diluted with 1000 C.c. [old form 6 fl. oz. 6 fl. dr.] of Water. Distillation will usually commence before the whole of the Acid has been added. When all the Acid has been introduced, regulate the distillation by the application or withdrawal of a gentle heat until no more nitrous ether distils over. Wash the distillate, first, with 100 C.c. [old form 5½ fl. dr.] of ice-cold Water to remove any Alcohol which may have passed over, and then remove any traces of Acid by washing the Ether with 100 C.c. [old form 5½ fl. dr.] of ice-cold Water, in which the Sodium Carbonate had previously been dissolved. Carefully separate the Ether from the aqueous liquid, and agitate it, in a well-stoppered vial, with the Potassium Carbonate to remove traces of water. Then filter it through a pellet of cotton, in a covered funnel, into a tared bottle containing

2000 C.c. [old form 13½ fl. oz.] of Deodorized Alcohol. Ascertain the weight of the Nitrous Ether filtered into the Alcohol by noting the increase of weight of the tared bottle and contents, and then add enough Deodorized Alcohol to make the mixture weigh 22 times the weight of the Nitrous Ether added. Lastly, transfer the product to small, dark, amber-colored, well-stoppered vials, and keep them in a cool place, remote from lights or fire.

A clear, mobile, volatile, and inflammable liquid of a pale yellowish or faintly greenish-yellow tint, having a fragrant, ethereal, and pungent odor free from acidity, and a sharp, burning taste.

Specific gravity: about 0.886 to 0.842 at 15° C. (59° F.).

When freshly prepared, or even after being kept for some time with but little exposure to light and air, it is neutral to litmus paper. When long kept, or after having been freely exposed to air and light, it acquires an acid reaction, but it should not effervesce when a crystal of potassium bicarbonate is dropped into it.

If a test-tube be half filled with the Spirit, and put into a water-bath heated to 65° C. (149° F.) until it has acquired this temperature, the Spirit should boil distinctly upon the addition of a few small pieces of broken glass.

If 10 C.c. of the Spirit be mixed with 5 C.c. of Potassium Hydrate T.S., previously diluted with 5 C.c. of Water, the mixture will assume a yellow color which should not turn decidedly brown within twelve hours (limit of *aldehyde*).

If 5 C.c. of recently prepared Spirit of Nitrous Ether be introduced into a nitrometer, and followed, first, by 10 C.c. of Potassium Iodide T.S., and then by 10 C.c. of normal Sulphuric Acid, the volume of nitrogen dioxide generated at the ordinary indoor temperature (assumed to be at or near 25° C., or 77° F.) should not be less than 55 C.c. (corresponding to about 4 per cent. of pure ethyl nitrite).

For comments on the process, see Spiritus Ætheris Nitrosi, Part V.

SPIRITUS AMMONIÆ. U. S. Spirit of Ammonia.

An alcoholic solution of Ammonia [$\text{NH}_3 = 17.01$] containing 10 per cent., by weight, of the gas.

	Metric.	Old form.
Stronger Ammonia Water	250 C. c.	8 fl. oz.
Alcohol, recently distilled, and, after distillation, kept in glass vessels, a sufficient quantity.		

Pour the Stronger Ammonia Water into a flask provided with a safety funnel, and connected, by means of a glass condenser, with a well-cooled receiver containing 500 C.c. [old form 16 fl. oz.] of Alcohol, the delivery tube of the condenser reaching to near the bottom of the receiver. Heat the flask carefully, and very gradually, to a temperature not exceeding 60° C. (140° F.), and maintain it at that temperature for about ten minutes. Then disconnect the receiver, and, having ascertained the ammoniacal strength of the contents by means of normal sulphuric acid (rosolic acid test-solution being used as indicator), add enough Alcohol to make the product contain 10 per cent., by weight, of Ammonia.

Keep the Spirit in glass-stoppered bottles, in a cool place.

A colorless liquid, having a strong odor of ammonia, and a specific gravity of about 0.810 at 15° C. (59° F.).

When diluted with water, it should respond to the tests for identity and purity mentioned under Ammonia Water (see *Aqua Ammoniæ*).

If 8.4 Gm. (or 4.2 C.c.) of Spirit of Ammonia be diluted with water, it should require, for complete neutralization, 20 C.c. of normal sulphuric acid (each C.c. corresponding to 0.5 per cent. of Ammonia), rosolic acid being used as indicator.

For comments on the process, see Spiritus Ammoniæ, Part IV.

SPIRITUS AMMONIÆ AROMATICUS. U. S. Aromatic Spirit of Ammonia.

	Metric.	Old form
Ammonium Carbonate, in translucent pieces	34 Gm.	500 grains.
Ammonia Water	90 C.c.	2 fl. oz. 7 fl. dr.
Oil of Lemon	10 C.c.	2½ fl. dr.
Oil of Lavender Flowers	1 C.c.	15 minims.
Oil of Nutmeg	1 C.c.	15 minims.
Alcohol	700 C.c.	22 fl. oz. 8 fl. dr.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Ammonia Water, contained in a flask, add 140 C.c. [old form 4½ fl. oz.] of Distilled Water, and afterwards the Ammonium Carbonate reduced to a moderately fine powder. Close the flask and agitate the contents until the Carbonate is dissolved. Introduce the Alcohol into a graduated bottle of suitable capacity, add the oils, then gradually add the solution of Ammonium Carbonate, and afterwards enough Distilled Water to make the product measure 1000 C.c. [old form 2 pints]. Set the liquid aside during twenty-four hours in a cool place, occasionally agitating, then filter it through paper, in a well-covered funnel. (If the white crystalline precipitate which often falls when the water is added has not disappeared after the liquid has stood twenty-four hours, shake thoroughly and allow it to stand a day longer before filtering.)

Keep the product in glass-stoppered bottles, in a cool place.

A nearly colorless liquid when freshly prepared, but gradually acquiring a somewhat darker tint.

It has a pungent, ammoniacal odor and taste.

Specific gravity: about 0.905 at 15° C. (59° F.).

For comments on the process, see *Spiritus Ammoniæ Aromaticus*, Part IV.

SPIRITUS AMYGDALÆ AMARÆ. U. S. Spirit of Bitter Almond.
[ESSENCE OF BITTER ALMOND.]

	Metric.	Old form.
Oil of Bitter Almond	10 C.c.	154 minims.
Alcohol	800 C.c.	25½ fl. oz.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Oil in the Alcohol, and add enough Distilled Water to make the product measure 1000 C.c. [old form 2 pints].

SPIRITUS ANISI. U. S. Spirit of Anise.

	Metric.	Old form.
Oil of Anise	100 C.c.	1 fl. oz.
Deodorized Alcohol	900 C.c.	9 fl. oz.
To make	1000 C.c.	10 fl. oz.

Mix them.

SPIRITUS AURANTII. U. S. Spirit of Orange.

	Metric.	Old form.
Oil of Orange Peel	50 C.c.	6½ fl. dr.
Deodorized Alcohol	950 C.c.	15 fl. oz. 1½ fl. dr.
To make	1000 C.c.	1 pint.

Mix them.

SPIRITUS AURANTII COMPOSITUS. U. S. Compound Spirit of Orange.

	Metric.	Old form.
Oil of Orange Peel	200 C.c.	6 fl. oz. 3 fl. dr.
Oil of Lemon	50 C.c.	1 fl. oz. 5 fl. dr.
Oil of Coriander	20 C.c.	5 fl. dr.
Oil of Anise	5 C.c.	76 minims.
Deodorized Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix them. Keep the product in completely filled, well-stoppered bottles, in a cool and dark place.

SPIRITUS CAMPHORÆ. U. S. Spirit of Camphor.

	Metric.	Old form.
Camphor	100 Gm.	3 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Camphor in 800 C.c. [old form 25½ fl. oz.] of Alcohol, filter through paper, and pass enough Alcohol through the filter to make the product measure 1000 C.c. [old form 2 pints].

SPIRITUS CHLOROFORMI. U. S. Spirit of Chloroform.

	Metric.	Old form.
Chloroform	60 C.c.	1 fl. oz. 7½ fl. dr.
Alcohol	940 C.c.	80 fl. oz. ½ fl. dr.
To make	1000 C.c.	2 pints.

Mix them.

SPIRITUS CINNAMOMI. U. S. Spirit of Cinnamon.

	Metric.	Old form.
Oil of Cinnamon	100 C.c.	1 fl. oz.
Alcohol	900 C.c.	9 fl. oz.
To make	1000 C.c.	10 fl. oz.

Mix them.

SPIRITUS FRUMENTI. U. S. Whiskey.

An alcoholic liquid obtained by the distillation of the mash of fermented grain (usually of mixtures of corn, wheat, and rye), and at least two years old.

An amber-colored liquid, having a distinctive odor and taste, and a slightly acid reaction.

Its specific gravity should not be more than 0.930, nor less than 0.917, corresponding, approximately, to an alcoholic strength of 44 to 50 per cent. by weight, or 50 to 58 per cent. by volume.

If 100 C.c. of Whiskey be very slowly evaporated in a tared capsule on a water-bath, the last portions volatilized should not have a harsh or disagreeable odor (absence of more than traces of *fusel oil from grain*); and the residue, when dried at 100° C. (212° F.), should not weigh more than 0.25 Gm. This residue should have no sweet or distinctly spicy taste (absence of *added sugar, glycerin, or aromatic substances*). It should almost completely dissolve in 10 C.c. of cold water, forming a solution which is colored not deeper than light green by a few drops of dilute ferric chloride T.S. made by mixing the latter with 10 volumes of water (absence of more than traces of *oak tannin* from casks).

To render 100 C.c. of Whiskey distinctly alkaline to litmus should not require more than 1.2 C.c. of potassium hydrate V.S. (limit of *free acid*).

SPIRITUS GAULTHERIÆ. U.S. Spirit of Gaultheria.

	Metric.	Old form.
Oil of Gaultheria	50 C.c.	1 fl. oz.
Alcohol	950 C.c.	19 fl. oz.
To make	1000 C.c.	20 fl. oz.

Mix them.

SPIRITUS GLONOINI. U.S. Spirit of Glonoin.

[SPIRIT OF NITROGLYCERIN.]

An alcoholic solution of Glonoin [Glyceryl (or Propenyl) trinitrate, or Nitroglycerin; $C_3H_5(NO_3)_3 = 226.58$], containing 1 per cent., by weight, of the substance.

Spirit of Glonoin should be kept and transported in well-stoppered tin cans, and should be stored in a cool place, remote from lights or fire.

Great care should be exercised in handling, packing, transporting, or storing the Spirit, since a dangerous explosion may result if any considerable quantity of it be spilled and the alcohol be partly or wholly lost by evaporation.

A clear, colorless liquid, possessing the odor and taste of alcohol. Caution should be exercised in tasting it, since even a small quantity of it is liable to produce a violent headache. The same effect is produced when it is freely applied to the skin.

It is neutral to litmus paper.

Specific gravity: 0.826 to 0.832 at 15° C. (59° F.).

On diluting 10 C.c. of the Spirit with 15 C.c. of water,—both liquids, as well as the mixture, when measured, being brought to 15° C. (59° F.),—the liquid will exhibit at most a faint cloudiness, but the addition of a further portion of 5 C.c. of water should produce a white turbidity.

If the specific gravity of the Spirit be higher than 0.840, or if 10 C.c. of it be rendered turbid by less than 10 C.c. of water, the Spirit should be rejected.

SPIRITUS JUNIPERI. U.S. Spirit of Juniper.

	Metric.	Old form.
Oil of Juniper	50 C.c.	1 fl. oz.
Alcohol	950 C.c.	19 fl. oz.
To make	1000 C.c.	20 fl. oz.

Mix them.

SPIRITUS JUNIPERI COMPOSITUS. U.S. Compound Spirit of Juniper.

	Metric.	Old form.
Oil of Juniper	8 C.c.	80 minims.
Oil of Caraway	1 C.c.	4 minims.
Oil of Fennel	1 C.c.	4 minims.
Alcohol	1400 C.c.	11 fl. oz.
Water, a sufficient quantity,		
To make	2000 C.c.	1 pint.

Dissolve the Oils in the Alcohol, and gradually add enough Water to make the product measure 2000 C.c. [old form 1 pint].

SPIRITUS LAVANDULÆ. U.S. Spirit of Lavender.

	Metric.	Old form.
Oil of Lavender Flowers	50 C.c.	1 fl. oz.
Deodorized Alcohol	950 C.c.	19 fl. oz.
To make	1000 C.c.	20 fl. oz.

Mix them.

SPIRITUS LIMONIS. U.S. Spirit of Lemon.**[ESSENCE OF LEMON.]**

	Metric.	Old form.
Oil of Lemon	50 C.c.	884 minims.
Lemon Peel, freshly grated	50 Gm.	865 grains.
Deodorized Alcohol, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Dissolve the Oil of Lemon in 900 C.c. [old form 14½ fl. oz.] of Deodorized Alcohol, add the Lemon Peel, and macerate for twenty-four hours. Then filter through paper, and add, through the filter, enough Deodorized Alcohol to make the Spirit measure 1000 C.c. [old form 1 pint].

SPIRITUS MENTHÆ PIPERITÆ. U.S. Spirit of Peppermint.**[ESSENCE OF PEPPERMINT.]**

	Metric.	Old form.
Oil of Peppermint	100 C.c.	8 fl. oz. 96 min.
Peppermint, bruised	10 Gm.	146 grains.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Oil of Peppermint in 900 C.c. [old form 29 fl. oz.] of Alcohol, add the Peppermint, and macerate for twenty-four hours. Then filter through paper, and add, through the filter, enough Alcohol to make the Spirit measure 1000 C.c. [old form 2 pints].

SPIRITUS MENTHÆ VIRIDIS. U. S. Spirit of Spearmint.**[ESSENCE OF SPEARMINT.]**

	Metric.	Old form.
Oil of Spearmint	100 C.c.	8 fl. oz. 96 min.
Spearmint, bruised	10 Gm.	146 grains.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Oil of Spearmint in 900 C.c. [old form 29 fl. oz.] of Alcohol, add the Spearmint, and macerate for twenty-four hours. Then filter through paper, and add, through the filter, enough Alcohol to make the Spirit measure 1000 C.c. [old form 2 pints].

SPIRITUS MYRCIÆ. U. S. Spirit of Myrcia.**[BAY RUM.]**

	Metric.	Old form.
Oil of Myrcia	16 C.c.	4 fl. dr.
Oil of Orange Peel	1 C.c.	15 minims.
Oil of Pimenta	1 C.c.	15 minims.
Alcohol	1220 C.c.	89 fl. oz.
Water, a sufficient quantity,		
To make	2000 C.c.	4 pints.

Mix the Oils with the Alcohol, and gradually add Water until the solution measures 2000 C.c. [old form 4 pints]. Set the mixture aside, in a well-stoppered bottle, for eight days, then filter it through paper, in a well-covered funnel.

SPIRITUS MYRISTICÆ. U. S. Spirit of Nutmeg.**[ESSENCE OF NUTMEG.]**

	Metric.	Old form.
Oil of Nutmeg	50 C.c.	1 fl. oz.
Alcohol	950 C.c.	19 fl. oz.
To make	1000 C.c.	20 fl. oz.

Mix them.

SPIRITUS PHOSPHORI. U. S. Spirit of Phosphorus.**[TINCTURE OF PHOSPHORUS.]**

	Metric.	Old form.
Phosphorus	1.2 Gm.	17½ grains.
Absolute Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Weigh the Phosphorus in a tared capsule containing water, then dry it carefully and quickly with blotting paper, and introduce it into a flask containing 1000 C.c. [old form 2 pints] of Absolute Alcohol. Connect the flask with an upright condenser, supplied with cold water, and apply the heat of a water-bath, so that the Alcohol

may be kept gently boiling, until the Phosphorus is dissolved. Then allow the liquid to become cold, and, if necessary, add to it enough Absolute Alcohol to make it measure 1000 C.c. [old form 2 pints]. Lastly, transfer the Spirit to small, dark amber-colored vials, which should be securely stoppered, and kept in a cool and dark place.

SPIRITUS VINI GALLICI. U.S. Brandy.

An alcoholic liquid obtained by the distillation of the fermented, unmodified juice of fresh grapes, and at least four years old.

A pale, amber-colored liquid, having a distinctive odor and taste, and a slightly acid reaction.

Its specific gravity should not be more than 0.941, nor less than 0.925, corresponding, approximately, to an alcoholic strength of 89 to 47 per cent. by weight, or 46 to 55 per cent. by volume.

If 100 C.c. of Brandy be very slowly evaporated in a tared capsule on a water-bath, the last portions volatilized should have an agreeable odor free from harshness (absence of *fusel oil from grain or potato spirit*); and the residue, when dried at 100° C. (212° F.), should not weigh more than 1.5 Gm. This residue should have no sweet or distinctly spicy taste (absence of *added sugar, glycerin, or aromatic substances*). It should almost completely dissolve in 10 C.c. of cold water, forming a solution which is colored not deeper than light green by a few drops of dilute ferric chloride T.S. made by mixing the latter with 10 volumes of water (absence of more than traces of *oak tannin* from casks).

To render 100 C.c. of Brandy distinctly alkaline to litmus should require not more than 1 C.c. of potassium hydrate V.S. (limit of *free acid*).

For comments upon Spiritus Vini Gallici, see Part V.

. Elixiria. *Elixirs.*

Elixirs are aromatic, sweetened, spirituous preparations, containing small quantities of active medicinal substances. Although they are largely employed throughout the United States, but two have been made official,—aromatic elixir and elixir of phosphorus. The former is intended as a vehicle for the administration of active remedies in small doses. There will be found in the Appendix a number of formulas of unofficial elixirs.

ELIXIR AROMATICUM. U.S. Aromatic Elixir.

	Metric.	Old form.
Compound Spirit of Orange	12 C.c.	185 minima.
Syrup	375 C.c.	12 fl. oz.
Precipitated Calcium Phosphate	15 Gm.	$\frac{1}{2}$ oz. av.
Deodorized Alcohol,		
Distilled Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Compound Spirit of Orange add enough Deodorized Alcohol to make 250 C.c. [old form 8 fl. oz.]. To this solution add the Syrup in several portions, agitating after each addition, and afterwards add, in the same manner, 375 C.c. [old form 12 fl. oz.] of Distilled Water. Mix the Precipitated Calcium Phosphate intimately with the liquid, and then filter through a wetted filter, returning the first portions of the filtrate until a transparent liquid is obtained. Lastly, wash the

filter with a mixture of 1 volume of Deodorized Alcohol and 3 volumes of Distilled Water, until the product measures 1000 C.c. [old form 2 pints].

ELIXIR PHOSPHORI. U. S. Elixir of Phosphorus.

	Metric.	Old form.
Spirit of Phosphorus	210 C.c.	6 fl. oz. 6 fl. dr.
Oil of Anise	2 C.c.	80 minims.
Glycerin	550 C.c.	17½ fl. oz.
Aromatic Elixir, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Spirit of Phosphorus, contained in a graduated bottle, add the Oil of Anise and Glycerin, and mix them by repeatedly inverting the bottle, until they form a clear liquid. Then add Aromatic Elixir, in several portions, gently agitating after each addition, until a transparent liquid is obtained, and the product measures 1000 C.c. [old form 2 pints]. Keep the product in dark amber-colored, well-stoppered bottles, in a cool and dark place.

Each cubic centimeter of Elixir of Phosphorus represents about *one-fourth milligramme* (0.00025 Gm.) of phosphorus.

QUESTIONS ON CHAPTER XXIII.

ALCOHOLIC SOLUTIONS.

In pharmacy, what are spirits?

In how many different ways are the official spirits made?

How many of them are there?

What is the most usual method of making them?

How many of them are made in this way?

In making spirits, what is the object of maceration?

What spirit is made by gaseous solution? By chemical reaction?

What official spirits are made by distillation?

Where spirits can be made either by distillation or by solution, which is the better process, and why?

Give the formula and process for making spirit of ether. Hoffmann's anodyne.

What is the official name in Latin and in English?

What is spirit of nitrous ether?

How much of the crude ether does it contain?

What is the formula in symbols of ethyl nitrite?

What is its molecular weight?

How is this obtained?

What is its popular name or synonyme?

How is it made?

What is spirit of ammonia?

How is it prepared?

What percentage of gas by weight does it contain?

What is the formula in symbols of ammonia?

What is its molecular weight?

Which is the stronger of the two preparations, spiritus ammoniæ or aqua ammoniæ?

What is aromatic spirit of ammonia?

How is it prepared?

- .What is the Latin name of spirit of bitter almond?
What is its popular name or synonyme?
How is it made? For what is it used?
Give the official name, formula, and mode of making spirit of anise. Spirit of orange. Compound spirit of orange. Spirit of camphor. Spirit of chloroform. Spirit of cinnamon.
What is whiskey? (as official in the U. S. P.)
Give the formula and mode of making spirit of gaultheria.
What is the Latin name of spirit of glonoin?
What is its popular name or synonyme?
How much glonoin does it contain?
What is the chemical name of glonoin?
Why should great care be exercised in using this preparation?
What is the specific gravity of spirit of glonoin? Spirit of juniper? Compound spirit of juniper? Spirit of lavender? Spirit of lemon?
What is the popular name of spirit of lemon?
Give the formula and mode of making spirit of peppermint.
What is its popular name?
Give the formula and mode of making spirit of spearmint.
What is the official name of bay rum, in Latin and in English?
How is it made?
Give the formula and mode of making spirit of nutmeg.
How is spirit of phosphorus made?
How much phosphorus does it contain?
What is the official definition of brandy?
How much alcohol does it contain?
What are elixirs?
What is aromatic elixir used for?
How is it made?

CHAPTER XXIV.

ETHEREAL SOLUTIONS.

Collodia. *Collodions.*

COLLODIONS are liquid preparations intended for external use, having for their base a solution of pyroxylin, or gun-cotton, in a mixture of ether and alcohol. (For a description of the properties of pyroxylin and collodions, see Part V.) Collodions are applied to the skin by means of a soft brush, and when the ether and alcohol evaporate, a film is left on the surface, which either acts as a protection or brings a medicating agent in contact with the epidermis. *Four* collodions are official.

Official Collodions.

Name.	Proportions.
Collodium.	80 Gm. Pyroxylin; 750 C.c. Stronger Ether; 250 C.c. Alcohol. Decant the clear Collodion from the sediment.
Collodium Cantharidatum.	60 Gm. Cantharides, No. 60 Powder; 85 Gm. Flexible Collodion; Commercial Chloroform sufficient to exhaust the Cantharides; after distillation the residue should weigh 15 Gm. Decant the clear Cantharidal Collodion from the sediment.
Collodium Flexile.	920 Gm. Collodion; 50 Gm. Canada Turpentine; 80 Gm. Castor Oil.
Collodium Stypticum.	20 Gm. Tannic Acid; 5 C.c. Alcohol; 25 C.c. Ether; Collodion, to make 100 C.c.

COLLODIUM. U.S. Collodion.

	Metric.	Old form.
Pyroxylin	30 Gm.	1 oz. av.
Ether	750 C.c.	24 fl. oz.
Alcohol	250 C.c.	8 fl. oz.
		2 pints.

To the Pyroxylin, contained in a suitable bottle, add the Ether, and let it stand for fifteen minutes; then add the Alcohol, and shake the bottle until the Pyroxylin is dissolved. Cork the bottle well, and set it aside until the liquid has become clear. Then decant the clear portion from any sediment which may have formed, and transfer it to bottles, which should be well corked.

Keep the Collodion in cork-stoppered bottles, in a cool place, remote from lights or fire.

COLLODIUM CANTHARIDATUM. U. S. Cantharidal Collodion.**[BLISTERING COLLODION.]**

	Metrie.	Old form.
Cantharides, in No. 60 powder	60 Gm.	2 oz. av. 50 grains.
Flexible Collodion	85 Gm.	8 oz. av.
Chloroform, a sufficient quantity,		
To make	100 Gm.	8 oz. av. 230 grains.

Pack the Cantharides firmly in a cylindrical percolator, and gradually pour Chloroform upon it, until the powder is exhausted. Recover the Chloroform by distillation from a water-bath, and evaporate the residue, in a capsule, on a water-bath, until it weighs 15 Gm. [old form 231 grains]. Dissolve this in the Flexible Collodion, and set it aside to become clear by settling. Finally pour off the clear portion from any sediment which may have formed, and transfer it to bottles, which should be securely corked.

Keep the Cantharidal Collodion in cork-stoppered bottles, in a cool place, remote from lights or fire.

COLLODIUM FLEXILE. U. S. Flexible Collodion.

	Metrie.	Old form.
Collodion	920 Gm.	8 oz. av.
Canada Turpentine	50 Gm.	190 grains.
Castor Oil	30 Gm.	115 grains.
To make	1000 Gm.	about 9 oz. av.

Weigh the ingredients, successively, into a tared bottle, and mix them thoroughly.

Keep the product in cork-stoppered bottles, in a cool place, remote from lights or fire.

COLLODIUM STYPTICUM. U. S. Styptic Collodion.

	Metrie.	Old form.
Tannic Acid	20 Gm.	308 grains.
Alcohol	5 C.c.	80 minims.
Ether	25 C.c.	405 minims.
Collodion, a sufficient quantity,		
To make	100 C.c.	8 fl. oz. 183 min.

Introduce the Tannic Acid, Alcohol, and Ether into a graduated bottle, agitate until the Tannic Acid is thoroughly incorporated and partially dissolved, then add enough Collodion to make up the volume to 100 C.c. [old form 3 fl. oz. 183 min.], and shake occasionally, until the Acid is completely dissolved.

Keep the product in cork-stoppered bottles, in a cool place, remote from lights or fire.

CHAPTER XXV.

OLEAGINOUS SOLUTIONS OR EXTERNAL APPLI- CATIONS.

Linimenta. *Liniments.*

THESE are solutions of various substances or mixtures in oily or alcoholic liquids containing fatty oils, intended for external application, and usually applied with friction and rubbing of the skin. There are *nine* official liniments, of which *three* are made with a fixed oil as the base, *five* with alcohol as the principal liquid, and *one* contains oil of turpentine. They are classified as follows:

Official Liniments.

Name.	Base.	Proportions.
Linimentum Ammonia.	Oil.	850 C.c. Ammonia Water; 50 C.c. Alcohol; 600 C.c. Cotton Seed Oil.
Linimentum Calcis.	Oil.	Equal volumes Solution of Lime and Linseed Oil.
Linimentum Camphoræ.	Oil.	200 Gm. Camphor; 800 Gm. Cotton Seed Oil.
Linimentum Belladonnæ.	Alcohol.	60 Gm. Camphor; 950 C.c. Fluid Extract of Belladonna.
Linimentum Chloroformi.	Alcohol.	800 C.c. Chloroform; 700 C.c. Soap Liniment.
Linimentum Saponis.	Alcohol.	70 Gm. Powdered Soap; 45 Gm. Camphor; 10 C.c. Oil of Rosemary; 750 C.c. Alcohol; Water, to make 1000 C.c.
Linimentum Saponis Mollis.	Alcohol.	650 Gm. Soft Soap; 20 C.c. Oil of Lavender Flowers; 800 C.c. Alcohol; Water, to make 1000 C.c.
Linimentum Sinapis Compositum.	Alcohol.	80 C.c. Volatile Oil of Mustard; 200 C.c. Fluid Extract of Mezerium; 60 Gm. Camphor; 150 C.c. Castor Oil; Alcohol, to make 1000 C.c.
Linimentum Terebinthinæ.	Oil of Turpentine.	650 Gm. Resin Cerate; 350 Gm. Oil of Turpentine.

PRACTICAL PROCESSES FOR OFFICIAL LINIMENTS.

LINIMENTUM AMMONIÆ. U. S. Ammonia Liniment.

[VOLATILE LINIMENT.]

	Metric.	Old form.
Ammonia Water	350 C.c.	11 fl. oz.
Alcohol	50 C.c.	2 fl. oz.
Cotton Seed Oil	600 C.c.	19 fl. oz.
To make	1000 C.c.	2 pints.

Mix them by agitation in a bottle, which should be well stoppered. This Liniment should be freshly prepared, when wanted.

LINIMENTUM BELLADONNÆ. U.S. Belladonna Liniment.

	Metric.	Old form.
Camphor	50 Gm.	780 grains.
Fluid Extract of Belladonna, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Camphor in about 200 C.c. [old form 6½ fl. oz.] of the Fluid Extract, and then add enough of the latter to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

LINIMENTUM CALCIS. U.S. Lime Liniment.

[CARBON OIL.]

Solution of Lime,
Linseed Oil, of each, one volume.

Mix them by agitation.

LINIMENTUM CAMPHORÆ. U.S. Camphor Liniment.

	Metric.	Old form.
Camphor, in coarse powder	200 Gm.	2 oz. av.
Cotton Seed Oil	800 Gm.	8 oz. av.
To make	1000 Gm.	10 oz. av.

Introduce the Camphor and the Cotton Seed Oil into a suitable flask, and apply a gentle heat, by means of a water-bath, loosely stoppering the flask during the operation. Agitate from time to time, until the Camphor is dissolved.

LINIMENTUM CHLOROFORMI. U.S. Chloroform Liniment.

	Metric.	Old form.
Chloroform	300 C.c.	9½ fl. oz.
Soap Liniment	700 C.c.	22½ fl. oz.
To make	1000 C.c.	2 pints.

Mix them by agitation.

LINIMENTUM SAPONIS. U.S. Soap Liniment.

	Metric.	Old form.
Soap, in fine powder	70 Gm.	2 oz. av. 147 gr.
Camphor, in small pieces	45 Gm.	1 oz. av. 220 gr.
Oil of Rosemary	10 C.c.	158 minims.
Alcohol	750 C.c.	24 fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Introduce the Camphor and the Alcohol into a suitable bottle, and shake until the Camphor is dissolved. Then add the Soap and Oil of

Rosemary, and shake the bottle well for a few minutes. Lastly, add enough Water to make 1000 C.c. [old form 2 pints], and again shake until the liquid becomes clear. Set it aside, in a cool place, for twenty-four hours, then filter.

LINIMENTUM SAPONIS MOLLIS. U. S. Liniment of Soft Soap.

[TINCTURA SAPONIS VIRIDIS, PHARM. 1880.]

	Metric.	Old form.
Soft Soap	650 Gm.	21½ oz. av.
Oil of Lavender	20 C.c.	5 fl. dr.
Alcohol	300 C.c.	9½ fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Oil of Lavender with the Alcohol, dissolve in this the Soft Soap by stirring or agitation, and set the solution aside for twenty-four hours. Then filter it through paper, and pass enough Water through the filter to make the product measure 1000 C.c. [old form 2 pints]. Mix thoroughly.

LINIMENTUM SINAPIS COMPOSITUM. U. S. Compound Liniment of Mustard.

	Metric.	Old form.
Volatile Oil of Mustard	30 C.c.	280 minims.
Fluid Extract of Mezereum	200 C.c.	8 fl. oz. 96 min.
Camphor	60 Gm.	1 oz. av.
Castor Oil	150 C.c.	2½ fl. oz.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Dissolve the Camphor in 500 C.c. [old form 8 fl. oz.] of Alcohol, and add the Fluid Extract of Mezereum; then add the Oil of Mustard and the Castor Oil and, finally, enough Alcohol to make the product measure 1000 C.c. [old form 1 pint]. Mix thoroughly.

LINIMENTUM TEREBINTHINÆ. U. S. Turpentine Liniment.

	Metric.	Old form.
Resin Cerate	650 Gm.	18 oz. av.
Oil of Turpentine	350 Gm.	7 oz. av.
To make	1000 Gm.	20 oz. av.

Melt the Resin Cerate in a capsule, on a water-bath, then add the Oil of Turpentine, and mix them thoroughly.

Oleata. Oleates.

The official oleates are liquid preparations made by dissolving metallic salts or alkaloids in oleic acid. The term oleate is also used commercially to designate solid preparations which are supposed to be chemical compounds of oleic acid with various bases. (See Part V.)

342 OLEAGINOUS SOLUTIONS OR EXTERNAL APPLICATIONS.

The official oleates are not assumed to be definite chemical compounds. The proportion of oleic acid is excessive, and they must be regarded as solutions of the medicating agent in oleic acid, the latter having special advantages as a basis for administering external remedies, being more readily absorbed than most of the fatty substances used in making ointments. *Three oleates are official.*

Official Oleates.

Names.	Proportions.
Oleatum Hydrargyri.	200 Gm. Yellow Mercuric Oxide; 800 Gm. Oleic Acid.
Oleatum Veratrinæ.	2 Gm. Veratrine; 98 Gm. Oleic Acid.
Oleatum Zinci.	50 Gm. Zinc Oxide; 950 Gm. Oleic Acid.

OLEATUM HYDRARGYRI. U.S. Oleate of Mercury.

	Metric.	Old form.
Yellow Mercuric Oxide, thoroughly dried	200 Gm.	2 oz. av.
Oleic Acid	800 Gm.	8 oz. av.
To make	1000 Gm.	10 oz. av.

Introduce the Oleic Acid into a capacious mortar, and gradually add to it the Yellow Mercuric Oxide by sifting it upon the surface of the Acid, and incorporate it by continuous stirring. Then set the mixture aside in a warm place, at a temperature not exceeding 40° C. (104° F.), and stir frequently, until the Oxide is dissolved.

OLEATUM VERATRINÆ. U.S. Oleate of Veratrine.

	Metric.	Old form.
Veratrine	2 Gm.	85 grains.
Oleic Acid	98 Gm.	3 oz. av. 402 gr.
To make	100 Gm.	4 oz. av.

Rub the Veratrine with a small quantity of Oleic Acid, in a warm mortar, to a smooth paste. Then add the remainder of the Oleic Acid, previously warmed, and stir frequently, until the Veratrine is dissolved.

OLEATUM ZINCI. U.S. Oleate of Zinc.

	Metric.	Old form.
Zinc Oxide	50 Gm.	1 oz. av.
Oleic Acid	950 Gm.	19 oz. av.
To make	1000 Gm.	20 oz. av.

Introduce the Oleic Acid into a capacious capsule, and gradually add to it the Zinc Oxide by sifting it upon the surface of the Acid, and incorporate it by continuous stirring. Set the mixture aside for a few hours, and then heat it on a water-bath, frequently stirring, until the Oxide is dissolved.

QUESTIONS ON CHAPTERS XXIV. AND XXV.

ETHEREAL SOLUTIONS, OLEAGINOUS SOLUTIONS OR
EXTERNAL APPLICATIONS.

What are collodions, and how are they used ?

How many are official, and what are their names ?

Give the formula and mode of making collodion.

What is the official name of cantharidal collodion ?

Give its formula and mode of preparation.

What is flexible collodion ?

Give its formula and mode of preparation.

What is styptic collodion ?

Give its formula and mode of preparation.

What are liniments ?

How many are official ?

What substances are used as the bases for these liniments ?

How is ammonia liniment made ?

What is its popular name or synonyme ?

Give the formula and mode of making belladonna liniment. Lime liniment.
What is this sometimes called ? Camphor liniment. Chloroform liniment. Soap
liniment.

What kind of soap should be used ?

What is the Latin name of liniment of soft soap ?

What was its official name in the U. S. P. 1880 ?

How is it made ?

Give the formula and mode of making compound liniment of mustard. Turpentine
liniment.

What are official oleates ?

How many are there, and what are their names ?

What advantage are they supposed to possess over the fatty substances that are
commonly used in ointments ?

Give the formula and mode of making oleate of mercury. Oleate of veratrine.
Oleate of zinc.

CHAPTER XXVI.

AQUEOUS LIQUIDS MADE BY PERCOLATION OR MACERATION.

Infusa. Infusions.

INFUSIONS are liquid preparations made by treating vegetable substances with either hot or cold water. *The drug is not subjected to the boiling process*, although it is common to pour boiling water over it; the whole is allowed to stand in a close vessel until cold. Whilst the use of hot water has the advantage of saving time in some cases, it is often objectionable because the *inert* principles in the drug are dissolved by the hot water, and as the infusion cools, they are precipitated out in such a very finely divided condition that they cannot be readily separated by colation or filtration. Cold water should be selected as the menstruum when the drug contains a valuable volatile principle, when the active agent is injured by heat, or when the desirable principles are readily soluble in water of ordinary temperature. The time required to make the infusion must be considered, for in warm weather it is quite possible for an infusion to ferment or decompose before it is finished.

Pure water should be used in making infusions, and large quantities should not be made at one time unless demanded for immediate use, as, without special precautions to preserve them, they soon become decomposed.

Of the inert principles found in plants, starch is extracted by hot water and albumen by cold water, whilst gum, sugar, and extractive are dissolved by both.

In making infusions the drug is usually coarsely comminuted, sliced, or bruised. Fine powders should be avoided whenever possible, because it is difficult to separate the fine particles from the infusion; and if percolation is resorted to, so much time is consumed in the operation, owing to the swelling of the powder, that decomposition may set in before the preparation is finished. The number of official infusions is *four*. Infusions are usually made in four ways: 1. By maceration. 2. By digestion. 3. By percolation. 4. By diluting fluid extracts.

1. **By Maceration.**—This is the process which is most frequently used. The general formula of the U. S. Pharmacopœia, which is here appended, furnishes a model.

GENERAL OFFICIAL FORMULA FOR INFUSIONS.

An ordinary Infusion, the strength of which is not directed by the physician, nor specified by the Pharmacopœia, shall be prepared by the following formula:

Take of	Metric.	Old form.
The Substance, coarsely comminuted	50 Gm.	865 grains.
Boiling Water	1000 C.c.	1 pint.
Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Put the substance into a suitable vessel provided with a cover, pour upon it the Boiling Water, cover the vessel tightly, and let it stand for half an hour. Then strain, and pass enough Water through the strainer to make the Infusion measure 1000 C.c. [old form 1 pint].

Caution.—The strength of Infusions of energetic or powerful substances should be specially prescribed by the physician.

It will be found most convenient to provide special apparatus for making infusions by maceration. One of the oldest forms is known as *Alsop's Infusion Jar*. This presents a very neat and effectual method of making the hot infusions. It consists of an earthen-ware mug, represented in Fig. 337, with a spout, *d*, proceeding from the bottom, and placed closely to the side of the vessel to prevent fracture; a perforated plate or diaphragm, *b*, supported on a ledge, *c*, at about one-quarter or one-third of the height of the vessel from the top; and a lid, *a*, which may be fastened on by a string through holes *f f*. The material to be submitted to infusion is placed on the perforated plate, and the hot water poured in so as to cover it, the vessel having been previously warmed, so as not to chill the liquid. As the water becomes impregnated, it acquires an increased specific gravity, and sinks to the bottom, its place being supplied by the unsaturated portion; and this circulation goes on until the whole of the soluble matter is extracted. In order to maintain a due warmth, the vessel may be placed upon a stove, or upon an iron plate near the fire. The advantage of the process is that the material is subjected to the solvent power of the least impregnated portion of the menstruum. In order that the vessel may be adapted for the preparation of different quantities of infusions, it would be an advantage to have ledges arranged within, at different heights, so that the diaphragm may be supported at any desired point. The surface of the liquid, *e*, should of course always be above the medicinal substance. Tinned iron or metallic vessels are unsuited for infusions; they are particularly objectionable when the drug used for making the preparation contains tannin, gallic acid, or an astringent substance. The liability of iron vessels to rust constitutes another objection.

FIG. 337.

Alsop's infusion jar.

Squire's Infusion Mug differs from the preceding in having a colander

FIG. 338.

Squire's infusion mug.

of queen's-ware, which is closely covered with a lid, and descends into the jar so as to form a diaphragm for the support of the substance to be infused. It has the advantage that the material, after having been exhausted, may be lifted out without disturbing the infusion. Fig. 338 shows the mug. It is made of queen's-ware, of the capacity of one pint, B: into it a thimble-shaped colander, A, descends, supported on the rim of the mug by a projecting ledge, with a carefully-fitted cover, C, which closes the whole. The substance to be submitted to infusion is introduced into the colander either before or after it has been fitted to the mug; the water, hot or cold, as the case may be, is then poured in so as to fill the lower vessel

and cover the materials in the upper; and, the cover having been applied, the vessel is set aside for the length of time required. The colander is then to

FIG. 339.

Infusion pitcher.

FIG. 340.

Infusion mug (home-made).

be lifted out, and the infusion, without having to strain it, is ready for use.

Fig. 339 represents an earthen-ware infusion pitcher, which may be used for making a gallon of infusion: it is useful where there is a large demand. Its principle of action is similar to that of Squire's infusion mug. A still better and cheaper apparatus may be made by the pharmacist himself, by selecting a queen's-ware or porcelain tea- or coffee-pot, A, as in Fig. 340, and if a hole is bored with the broken end of a small file through the top, close to the handle, a copper wire may be passed through the hole and around the handle, and made to terminate in a hook. The material to be infused is loosely tied up in a square piece of cheese-cloth (coarse, thin muslin) and suspended from the hook: the hot water soon penetrates all parts of the drug and dissolves out the soluble principles by circulatory displacement. This method has the great advantage that no further straining is needed, as the bag retains all of the solid undissolved portion; this may be pressed and the contents thrown away.

Official Infusions made by Maceration.

Name.	Proportion.	Use and Dose.
Infusum Digitalis.	15 Gm. Digitalis; 150 C.c. Cinnamon Water; 100 C.c. Alcohol; 500 C.c. Boiling Water; Cold Water, to make 1000 C.c.	Diuretic, etc., ℥iv.
Infusum Sennæ Compositum.	60 Gm. Senna; 120 Gm. Manna; 120 Gm. Magnesium Sulph.; 20 Gm. Fennel; 800 C.c. Boiling Water; Cold Water, to make 1000 C.c.	Purgative, ℥ij to ℥iv.

2. By Digestion.—The process of *digestion* consists in subjecting the substance to the continued action of moderate heat below the boiling temperature. In making infusions digestion is often very useful, although it may not be directed in the formula. It generally suffices to place the infusion vessel (see Fig. 340) upon a moderately hot portion of the stove-plate, or upon the floor near the stove or source of heat.

3. By Percolation.—This method of making infusions is by far the most satisfactory, and should be used whenever possible. It should be selected when the desirable principles are easily dissolved in water, and when the amount of menstruum is amply sufficient to exhaust the drug thoroughly. Percolation presents the advantages of furnishing a finished preparation, straining being unnecessary. Again, precipitation from the deposition of inert principles after the infusion has been strained, due to the principles being soluble in hot water but insoluble in cold water, is avoided. The chief drawback to the adoption of percolation in making infusions is the length of time it takes to exhaust the drug with water. Infusions are generally extemporaneous preparations, and they are frequently desired quickly: hence the process of maceration is often selected in preference.

Official Infusions made by Percolation.

Name.	Proportion.	Use.
Infusum Cinchonæ.	60 Gm. Cinchona; 10 C.c. Aromatic Sulphuric Acid; Water, to make 1000 C.c.	Tonic.
Infusum Pruni Virginianæ.	40 Gm. Wild Cherry Bark; Water, to make 1000 C.c.	Tonic.

Preservation of Infusions.—The difficulty in preserving infusions arises from the decomposition of the principles which are extracted by water and retained in the preparation. If sufficient alcohol is added to prevent decomposition, the therapeutic action of the infusion is usually interfered with, owing to the comparatively large proportion of spirit contained in the dose. Alcohol is successfully used in preparations like infusion of gentian, orange peel, etc., or simple tonics. If an antiseptic, like boric, carbolic, or salicylic acid, is used, the same objection exists,—the interference due to the therapeutic action of the antiseptic.

It has been proved that infusions may be preserved for a long time, if they are protected from the microscopic organisms which float in the

Fig. 341.

Infusion bottle.

air. A simple method is to heat the infusion contained in the bottle gradually to the boiling-point, in order to destroy any of the spores that may be present, and then to transfer it at once to small bottles, which are filled to the brim, the corks forced in and tied over, and the cork, lip, and neck of each bottle dipped into hot sealing-wax. A useful modification of Almen's method consists in heating to the boiling-point the infusion contained in a bottle in a water-bath. The rubber cork of the bottle is perforated so as to admit a long bent tube and a short tube; the short tube is loosely filled with cotton, the long limb of the bent tube is passed through the cork, and a rubber tube with a pinch-cock attached, as shown in Fig. 341. The cotton permits the admission of air into the bottle, but excludes spores and dust. The infusion may be drawn as wanted from the bottle by the rubber tube and syphon, the flow

being controlled by the pinch-cock and started by suction.

Infusions from Fluid Extracts.—The habit of making infusions from concentrated alcoholic tinctures or fluid extracts is improper and unjustifiable, except in those few cases in which the active and desirable principles of the drug are equally soluble in alcohol and in water, or in the menstrua used for both fluid extract and infusion. This is well illustrated in those preparations in which the activity of the drug is due to resinous bodies. Alcoholic menstrua here are necessary to dissolve the resins, and if such a fluid extract is added to water, precipitation takes place and the filtered infusion is worthless. If the precipitate is inert or does not carry down with it any portion of the active principle, and is readily separated, the only objection to the infusion is the presence of the alcohol, which may or may not seriously interfere with the therapeutic action, according as the quantity present is large or small. The saving in time and labor by making infusions in this way is the cause of the frequent employment of this method, but it should never be used if the therapeutic action of the drug is weakened thereby. The substitution of a fluid extract infusion in a prescription for one directed to be made by the official process is very reprehensible.

PRACTICAL PROCESSES FOR OFFICIAL INFUSIONS.

INFUSA. Infusions.

General Official Formula.—An ordinary infusion, the strength of which is not directed by the physician, nor specified by the Pharmacopœia, shall be prepared by the following formula :

Take of	Metric.	Old form.
The Substance, coarsely comminuted	50 Gm.	865 grains.
Boiling Water	1000 C.c.	16 fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Put the substance into a suitable vessel, provided with a cover, pour upon it the Boiling Water, cover the vessel tightly, and let it stand for half an hour. Then strain, and pass enough Water through the strainer to make the Infusion measure 1000 C.c. [old form 1 pint].

Caution.—The strength of infusions of energetic or powerful substances should be specially prescribed by the physician.

INFUSUM CINCHONÆ. U.S. Infusion of Cinchona.

	Metric.	Old form.
Cinchona, in No. 40 powder	60 Gm.	2 oz. av.
Aromatic Sulphuric Acid	10 C.c.	146 minims.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Acid with 500 C.c. [old form 16 fl. oz.] of Water, and moisten the powder with 30 C.c. [old form 1 fl. oz.] of the mixture; pack it firmly in a conical glass percolator, and gradually pour upon it, first, the remainder of the mixture, and afterwards Water, until the Infusion measures 1000 C.c. [old form 2 pints].

INFUSUM DIGITALIS. U.S. Infusion of Digitalis.

	Metric.	Old form.
Digitalis, bruised	15 Gm.	$\frac{1}{2}$ oz. av.
Alcohol	100 C.c.	8 $\frac{1}{2}$ fl. oz.
Cinnamon Water	150 C.c.	5 fl. oz.
Boiling Water	500 C.c.	16 fl. oz.
Cold Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Upon the Digitalis, contained in a suitable vessel, pour the Boiling Water, and allow it to macerate until the mixture is cold. Then strain, add the Alcohol and Cinnamon Water to the strained liquid, and pass enough Cold Water through the residue on the strainer to make the product measure 1000 C.c. [old form 2 pints].

INFUSUM PRUNI VIRGINIANÆ. U.S. Infusion of Wild Cherry.

	Metric.	Old form.
Wild Cherry, in No. 20 powder	40 Gm.	584 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 60 C.c. [old form 2 fl. oz.] of Water, and macerate for one hour; then pack it firmly in a conical glass percolator, and gradually pour Water upon it until the Infusion measures 1000 C.c. [old form 2 pints].

INFUSUM SENNÆ COMPOSITUM. U.S. Compound Infusion of Senna.

[BLACK DRAUGHT.]

	Metric.	Old form.
Senna	60 Gm.	2 oz. av.
Manna	120 Gm.	4 oz. av.
Magnesium Sulphate	120 Gm.	4 oz. av.
Fennel, bruised	20 Gm.	292 grains.
Boiling Water	800 C.c.	25 fl. oz.
Cold Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Upon the Senna and Fennel, contained in a suitable vessel, pour the Boiling Water, and macerate until the mixture is cold. Then strain with expression, dissolve in the infusion the Magnesium Sulphate and Manna, and again strain. Lastly, add enough Cold Water through the strainer containing the Senna and Fennel to make the Infusion measure 1000 C.c. [old form 2 pints].

UNOFFICIAL INFUSIONS.

INFUSUM GENTIANÆ COMPOSITUM. U.S. P. 1870. Compound Infusion of Gentian.

	Metric.	U.S. 1870.
Gentian, in moderately coarse powder	16 Gm.	$\frac{1}{2}$ troy oz.
Bitter Orange Peel, in moderately coarse powder	4 Gm.	60 grains.
Coriander, in moderately coarse powder	4 Gm.	60 grains.
Alcohol	60 C.c.	2 fl. oz.
Water, a sufficient quantity.		

Mix the Alcohol with fourteen fluidounces of Water (435 C.c. metric), and, having moistened the mixed powders with three fluidrachms (12 C.c. metric) of the menstruum, pack them firmly in a conical percolator, and gradually pour upon them first the remainder of the menstruum, and afterwards Water, until the filtered liquid measures a pint (500 C.c. metric).

INFUSUM GENTIANÆ COMPOSITUM FORTIUS. Concentrated Compound Infusion of Gentian (quadruple strength).

	Metric.	U.S. 1870.
Gentian, in moderately coarse powder	64 Gm.	2 troy oz.
Bitter Orange Peel, in moderately coarse powder	16 Gm.	$\frac{1}{2}$ troy oz.
Coriander, in moderately coarse powder	16 Gm.	$\frac{1}{2}$ troy oz.
Alcohol	60 C.c.	2 fl. oz.
Water	435 C.c.	14 fl. oz.

Mix the Alcohol with the Water, and, having moistened the mixed powders with one fluidounce (30 C.c. metric) of the menstruum, pack them firmly in a conical percolator, and gradually pour upon them

first the remainder of the menstruum, and afterwards Water, until the filtered liquid measures a pint (500 C.c. metric). This preparation keeps well, is four times the strength of the U. S. P. 1870 infusion, and may be diluted with Water containing Alcohol in the same proportion (1 Alcohol, 7 Water) when Compound Infusion of Gentian is prescribed. If water alone is used to dilute it, a precipitate is apt to occur.

INFUSUM ROSÆ COMPOSITUM. U. S. 1870. Compound Infusion of Rose.

	Metric.	U. S. 1870.
Red Rose (dried petals)	16 Gm.	$\frac{1}{2}$ troy oz.
Diluted Sulphuric Acid	12 C.c.	8 fl. dr.
Sugar (in coarse powder)	48 Gm.	$1\frac{1}{2}$ troy oz.
Boiling Water	1250 C.c.	$2\frac{1}{2}$ pints.

Pour the Water upon the Rose, in a covered glass or porcelain vessel; add the Acid, and macerate for half an hour. Lastly, dissolve the Sugar in the liquid, and strain.

INFUSUM SALVIÆ. U. S. 1870. Infusion of Sage.

	Metric.	U. S. 1870.
Sage	16 Gm.	$\frac{1}{2}$ troy oz.
Boiling Water	500 C.c.	1 pint.

Macerate for half an hour in a covered vessel, and strain.

Decocta. Decoctions.

Decoctions are liquid preparations made by *boiling* vegetable substances with water. The object sought to be gained in preparing decoctions is to secure the soluble active principles of drugs which are not injured by heat in aqueous solution. It is

FIG. 842.

Block-tin decoction vessel.

FIG. 843.

Brass water-bath.

obvious that very few drugs are suited to this form of administration; and decoctions are rapidly declining in favor. Hot infusion will generally afford a means of obtaining all the benefits that are derived from boiling the drug with water, whilst the prolonged action of boiling water generally exercises a dissociating effect upon the active principles. The disadvantages

of hot infusions are possessed in a more marked degree by decoctions (see page 344). In compound decoctions the ingredients are preferably added at different periods of the operation, the hard, ligneous drugs being added first, and the aromatics, or those containing volatile oils, at the close of the process, so that loss of activity of the latter may not ensue.

The earthen-ware or porcelain vessels used in preparing infusions are preferred for decoctions (see page 346), as they will bear the heat of boiling water, if heated gradually. Fig. 342 shows a block-tin vessel employed for preparing decoctions, used largely in Germany, and to some extent here. It is preferably used in connection with the brass water-bath, R (see Fig. 343). The rim, F, is somewhat flexible, whilst a small aperture permits the escape of steam. The empyreumatic odor which many decoctions possess when made over a naked fire, and caused by particles adhering to the bottom of the vessel and becoming charred, is avoided by the use of the water-bath.

Iron vessels are not used advantageously, because of the discoloration which is caused by the tannin of astringent drugs reacting with the iron.

The number of official decoctions is *two*.

PRACTICAL PROCESSES FOR OFFICIAL DECOCTIONS.

DECOCTA. Decoctions.

An ordinary Decoction, the strength of which is not directed by the physician, nor specified by the Pharmacopœia, shall be prepared by the following formula :

Take of	Metric.	Old form.
The Substance, coarsely comminuted	50 Gm.	365 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Put the substance into a suitable vessel provided with a cover, pour upon it 1000 C.c. [old form 1 pint] of cold Water, cover it well, and boil for fifteen minutes. Then let it cool to about 40° C. (104° F.), express, strain the expressed liquid, and pass enough cold Water through the strainer to make the product measure 1000 C.c. [old form 1 pint].

Caution.—The strength of Decoctions of energetic or powerful substances should be specially prescribed by the physician.

DECOCTUM CETRARIÆ. U. S. Decoction of Cetraria.

	Metric.	Old form.
Cetraria	50 Gm.	365 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Cover the Cetraria, in a suitable vessel, with 400 C.c. [old form 6½ fl. oz.] of cold Water, express after half an hour, and throw the liquid away. Then boil the Cetraria with 1000 C.c. [old form 1 pint] of Water for half an hour, strain, and add enough cold Water, through

the strainer, to make the product, when cold, measure 1000 C.c. [old form 1 pint].

DECOCTUM SARSAPARILLÆ COMPOSITUM. U. S. Compound

Decoction of Sarsaparilla.

	Metric.	Old form.
Sarsaparilla, cut and bruised	100 Gm.	8 oz. av. 148 gr.
Sassafras, in No. 20 powder	20 Gm.	292 grains.
Guaiacum Wood, rasped	20 Gm.	292 grains.
Glycyrrhiza, bruised	20 Gm.	292 grains.
Mezereum, cut and bruised	10 Gm.	146 grains.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Boil the Sarsaparilla and Guaiacum Wood for half an hour in a suitable vessel with 1000 C.c. [old form 2 pints] of Water. Then add the Sassafras, Glycyrrhiza, and Mezereum, cover the vessel well, and macerate for two hours. Finally strain, and add enough cold Water, through the strainer, to make the product measure 1000 C.c. [old form 2 pints].

UNOFFICIAL DECOCTIONS.

DECOCTUM SARSAPARILLÆ COMPOSITUM FORTIUS. P. G.

Zittmann's Decoction (Stronger).

	Metric.	Old form.
Sarsaparilla, cut	20 Gm.	2 oz. av.
Water	520 C.c.	50 fl. oz.

Digest for twenty-four hours, and, having added

	Metric.	Old form.
Sugar	1 Gm.	44 grains,
Alum	1 Gm.	44 grains,

expose them in a covered vessel, with occasional stirring, for three hours, to the heat of boiling water; then add to the mixture

	Metric.	Old form.
Anise, bruised	1 Gm.	44 grains.
Fennel, bruised	1 Gm.	44 grains.
Scena, cut	5 Gm.	$\frac{1}{2}$ oz. av.
Liquorice Root, cut	2 Gm.	88 grains.

Digest for a quarter of an hour, and strain the liquid with expression. Allow the Decoction to settle; then pour off the liquid, and, by the addition of water, bring it to 500 C.c. [or 3 pints].

DECOCTUM SARSAPARILLÆ COMPOSITUM MITIUS. P. G.

Zittmann's Decoction (Milder).

	Metric.	Old form.
Sarsaparilla, cut	10 Gm.	1 oz. av.
Water	480 C.c.	46 fl. oz.

Digest for twenty-four hours, and expose in a covered vessel, with

occasional stirring, for three hours, to the heat of boiling water on a water-bath. Then add to the decoction :

	Metric.	Old form.
Lemon Peel, cut	1 Gm.	44 grains.
Cinnamon, bruised	1 Gm.	44 grains.
Cardamom, bruised	1 Gm.	44 grains.
Liquorice Root, cut	1 Gm.	44 grains.

Digest for a quarter of an hour, and strain the liquid with expression. Allow the Decoction to settle; then pour off the liquid, and, by the addition of water, bring it to 500 C.c. [or 3 pints].

QUESTIONS ON CHAPTER XXVI.

AQUEOUS LIQUIDS MADE BY PERCOLATION OR MACERATION.

- What are infusions?
 In making infusions, should the substances be boiled?
 In what cases is hot water preferable? Cold water?
 What inert principles found in drugs are extracted by hot water, and what by cold water?
 What is the objection to using fine powders in making infusions?
 How many official infusions are there?
 By what four methods are infusions usually made?
 Which process is most frequently used in the U. S. P.?
 Give the general official formula for infusions.
 Describe Alsop's infusion jar. Squire's infusion mug.
 What special advantage has this mug?
 How may a cheap and convenient apparatus be made?
 What official infusions are made by maceration?
 How is the process of digestion used in making infusions?
 Is percolation a good process for making infusions?
 What are its advantages?
 What is its chief disadvantage?
 What official infusions are made by percolation?
 How may infusions be preserved?
 What is the objection to the use of antiseptics?
 Describe Almen's method of preserving infusions.
 Is the method of making infusions from fluid extracts a desirable one?
 What are the objections to it?
 Give the formula and mode of making infusion of cinchona.
 Give the formula and mode of making infusion of digitalis. Infusion of wild cherry. Compound infusion of senna.
 What is the popular name or synonyme of this preparation?
 Give the formula and mode of making compound infusion of gentian.
 What are decoctions?
 What is the object sought in preparing decoctions?
 What are the disadvantages attending decoctions?
 In making decoctions, should all the ingredients be put in together? Why?
 How may the empyreumatic odor which sometimes occurs in decoctions be avoided?
 Are iron vessels used advantageously in making decoctions? Why?
 How many official decoctions are there, and what are their names?
 Give the general official formula for making a decoction, where the strength has not been directed or specified
 Give the Latin name, formula, and mode of making decoction of cetraria. Compound decoction of sarsaparilla. Zittmann's stronger decoction. Zittmann's milder decoction.
 In what pharmacopœia are the last two official?

CHAPTER XXVII.

ALCOHOLIC LIQUIDS MADE BY PERCOLATION OR MACERATION.

Tincturae. Tinctures.

TINCTURES are alcoholic solutions of medicinal substances. They differ from spirits in being made from *non-volatile* bodies, there being but one official exception to this rule.¹ They are made by percolation, maceration, solution, or dilution, and the menstrua employed in the official tinctures are alcohol, diluted alcohol of various strengths, aromatic spirit of ammonia, or mixtures of alcohol, water, and glycerin. The official tinctures are *seventy-two* in number. In some unofficial tinctures, ether, spirit of ether, ammoniated alcohol, and spirit of nitrous ether are used. The use of alcohol as a solvent for the active or useful principles in drugs has been practised for many years, but it has required a long time and much experience to determine the proper proportion of water to dilute the alcohol so that the menstrua should thoroughly exhaust the drugs without extracting the inert principles, and yet contain sufficient alcohol to secure permanent preparations that will not deposit in time a portion of their active constituents. The advantages of alcohol as a menstruum have been proved so thoroughly, that the use of aqueous preparations has greatly declined in this country; and yet there are some instances, particularly in the case of the weak tinctures and those requiring a large dose, in which the therapeutic action of the menstruum almost equals that of the drug. In these cases, however, the physician may prefer the fluid extract when he does not desire the stimulating action of the alcohol in the tincture.

In selecting the menstrua the proportion of water in each case was made as great as possible without endangering the permanency of the preparation, one especial advantage being that such tinctures may be added in small proportions to aqueous preparations without serious precipitation. In this respect tinctures have usually a great advantage over fluid extracts, and weaker alcoholic menstrua are often used successfully for tinctures when such would be entirely unsuitable for fluid extracts, because the tincture, on account of its comparative weakness, having a much larger proportion of menstruum to exhaust the drug with, than the fluid extract, may have the excess over the proportion of alcohol used in the fluid extract made up with water. It has been proved that a pint of diluted alcohol will extract by percolation a larger proportion of the soluble principles of a drug than half a pint of alcohol and half a pint of water percolated separately through the drug.

¹ Tincture of Iodine.

The properties of *alcohol* are considered under another head (Part IV.), yet it seems desirable to notice here the solvent properties of this valuable preservative. It mixes freely with water, ether, acetic acid, a number of volatile oils, and castor oil; it dissolves resins, camphor, tannin, benzoic acid, chlorophyl, the alkaloids, balsams, iodine, ferric chloride, ammonium carbonate, etc. *Diluted alcohol* extracts from drugs, gum, extractive, chlorophyl, albumen, coloring matter, resins, volatile oils, alkaloids, sugar, tannin, etc. *Glycerin* is used in tinctures to prevent precipitation by retaining in solution principles which would otherwise in time be deposited.

Preparation.—Tinctures are officially made in three ways: 1. By percolation. 2. By maceration. 3. By solution or dilution.

1. **By Percolation.**—This is the best method for making tinctures, and it is always directed by the Pharmacopœia when practicable. Tinctures are made in this way from all drugs which are capable of being readily comminuted and displaced. The special advantages of percolation over maceration and expression are seen in the saving of time and labor, and in the greater efficiency of the product if the process has been carefully and skilfully performed. The introduction of metric measures into the U. S. Pharmacopœia of 1890 has greatly simplified the working formulas, there being now no calculations necessary to determine the end-product; the employment of metric receiving-bottles in percolating operations secures accuracy within reasonable limits, and their convenience will always be a recommendation. The use of parts by weight for tinctures proved unsatisfactory. If the drugs from which the tinctures are directed to be made could be standardized so that they would always contain a definite and uniform weight of the active principles, there might be an advantage in bringing the end-product to a weight which would bear a simple relation to the proportion of active principles selected as a standard; but the Pharmacopœia, for obvious reasons, has not fixed a limit for even the amount of moisture in air-dried drugs, and to assay all of them and fix a maximum and minimum limit of each active principle present in each drug would be impracticable, and in most cases impossible. Now, the variation in the amount of moisture and in the proportion of active principles in commercial drugs is far greater than is generally supposed; and so long as this ever-present bar to uniformity is not overcome, it is useless to regard the trifling advantage supposed to exist in favor of accuracy and convenience in weighing liquids: practically, the question of accuracy resolves itself into one of personal error, for a careful operator will make more accurate tinctures by using measures than a careless one will by using weights, and *vice versa*. Fifty-seven official tinctures, or more than two-thirds of the whole number, are made by percolation.

2. **By Maceration.**—This method of making tinctures is officially used in the case of resins, balsams, gums, soap, etc., where the practical difficulties likely to be encountered in percolation would offset any advantages that the latter process might possess (see page 253).

3. **By Solution or Dilution.**—A few tinctures are made in this way, such as tincture of iodine by dissolving iodine in alcohol, tincture of ferric chloride by diluting the solution of ferric chloride with alcohol.

The following tables exhibit the official tinctures, classified so as to show their relative strength both as to weight and volume, the variations in menstrua, and other useful data :

Table of Official Tinctures arranged in the Order of their Relative Strength, with Other Data.

Number of Grammes of Active Agent or Drug in 100 C.c.	Total Number of Grains of Active Ingredients in a Fluidrachm.	Official Name.	Fineness of Powder.	Menstruum.	Ingredients in 1000 C.c.
1.6	0.91	Tinctura Opii Camphorata.	. .	Dil. Alcohol 96; Glycerin 4.	4 Gm. Powd. Opium; 4 Gm. Benzoic Acid; 4 Gm. Camphor; 4 C.c. Oil of Anise.
Ext. 2	1.14	Nucis Vomicae.	. .	Alc. 75; Wat. 25.	20 Gm. Dried Extract.
4.5	2.56	Lavandulae Composita.	. .	Alc. 70; Wat. 25; Dil. Alc. to make 100.	8 C.c. Oil of Lavender Flowers; 2 C.c. Oil of Rosemary; 20 Gm. Cassia Cinnamon; 5 Gm. Cloves; 10 Gm. Nutmeg; 10 Gm. Red Saunders.
5	2.85	Cantharidis.	60	Alcohol.	50 Gm. Cantharides.
5	2.85	Capsici.	30	Alc. 95; Wat. 5.	50 Gm. Capsicum.
5	2.85	Moschi.	. .	Alc. 50; Wat. 50.	50 Gm. Musk.
5	2.85	Strophanthi.	30	Alc. 65; Wat. 35.	50 Gm. Strophanthus.
5.5	3.13	Cardamomi Composita.	40	Dil. Alcohol 95; Glycerin 5.	20 Gm. Cardamom; 20 Gm. Cassia Cinnamon; 10 Gm. Cayenne; 5 Gm. Cochineal.
7	3.99	Iodi.	. .	Alcohol.	70 Gm. Iodine.
9.4	5.36	Ferri Chloridi.	. .	Alc. 75; Wat. 25.	250 C.c. Solution of Ferric Chloride.
10	5.70	Arnicae Radicis.	40	Alc. 65; Wat. 35.	100 Gm. Arnica Root.
10	5.70	Bryoniae.	40	Alcohol.	100 Gm. Bryonia.
10	5.70	Calumbae.	20	Alc. 60; Wat. 40.	100 Gm. Calumba.
10	5.70	Cardamomi.	30	Dil. Alcohol.	100 Gm. Cardamom.
10	5.70	Chiratae.	40	Alc. 65; Wat. 35.	100 Gm. Chirata.
10	5.70	Cinnamomi.	40	Alc. 75; Wat. 20; Glycerin 5.	100 Gm. Ceylon Cinnamon.
10	5.70	Croci.	. .	Dil. Alcohol.	100 Gm. Saffron.
10	5.70	Kino.	. .	Alc. 65; Wat. 20; Glycerin 15.	100 Gm. Kino.
10	5.70	Matico.	40	Dil. Alcohol.	100 Gm. Matico.
10	5.70	Opii.	80	Alc. 50; Wat. 50.	100 Gm. Powd. Opium.
10	5.70	Opii Deodorati.	80	Alc. 20; Wat. 80.	100 Gm. Powd. Opium.
10	5.70	Quassiae.	40	Alc. 35; Wat. 65.	100 Gm. Quassia.
10	5.70	Serpentariae.	40	Alc. 65; Wat. 35.	100 Gm. Serpentina.
10	5.70	Sumbul.	30	Alc. 65; Wat. 35.	100 Gm. Sumbul.
10	5.70	Tolutana.	. .	Alcohol.	100 Gm. Balsam of Tolu.
10	5.70	Vanillae.	Cut and bruised.	Alc. 65; Wat. 35.	100 Gm. Vanilla; 200 Gm. Sugar.
12	6.84	Rhei.	40	Alc. 60; Wat. 30; Glycerin 10.	100 Gm. Rhubarb; 20 Gm. Cardamom.
15	8.56	Belladonnae Foliorum.	60	Dil. Alcohol.	150 Gm. Belladonna Leaves.
15	8.56	Cannabis Indicae.	40	Alcohol.	150 Gm. Indian Cannabis.

Table of Tinctures, U. S. P.—(Continued.)

Number of Grammes of Active Agent or Drug in 100 C.c.	Total Number of Grains of Active Ingredients in a Fluidrachm.	Official Name.	Fineness of Powder.	Menstruum.	Ingredients in 1000 C.c.
15	8.56	Tinctura Catechu Composita.	40	Dil. Alcohol.	100 Gm. Catechu; 50 Gm. Cassia Cinna- mon.
15	8.56	Colchici Semin.	30	Alc. 60; Wat. 40.	150 Gm. Colchicum Seed.
15	8.56	Digitalis.	60	Dil. Alcohol.	150 Gm. Digitalis.
15	8.56	Gelsemii.	60	Alc. 65; Wat. 35.	150 Gm. Gelsemium.
15	8.56	Gentianæ Com- posita.	40	Alc. 60; Wat. 40.	100 Gm. Gentian; 40 Gm. Bitter Orange Peel; 10 Gm. Car- damom.
15	8.56	Hyoscyami.	60	Dil. Alcohol.	150 Gm. Hyoscyamus.
15	8.56	Physostigmatis.	40	Alcohol.	150 Gm. Physostigma.
15	8.56	Sanguinarie.	60	Alc. 60; Wat. 40; Acetic Acid 2.	150 Gm. Sanguinaria.
15	8.56	Scillæ.	30	Alc. 75; Wat. 25.	150 Gm. Squill.
15	8.56	Stramonii Semi- nis.	40	Dil. Alcohol.	150 Gm. Stramonium Seed.
19	10.84	Rhei Dulcis.	40	Alc. 50; Wat. 40; Glycerin 10.	100 Gm. Rhubarb; 40 Gm. Glycyrrhiza; 40 Gm. Anise; 10 Gm. Cardamom.
20	11.40	Arnice Florum.	20	Dil. Alcohol.	200 Gm. Arnica Flow- ers.
20	11.40	Asafetide.	Bruised.	Alcohol.	200 Gm. Asafetida.
20	11.40	Aurantii Amari.	30	Alc. 60; Wat. 40.	200 Gm. Bitter Orange Peel.
20	11.40	Aurantii Dulcis.	Cut.	Alcohol.	200 Gm. Sweet Orange Peel.
20	11.40	Benzoini.	40	Alcohol.	200 Gm. Benzoin.
20	11.40	Calendulæ.	20	Alcohol.	200 Gm. Calendula.
20	11.40	Cimicifugæ.	60	Alcohol.	200 Gm. Cimicifuga.
20	11.40	Cinchonæ.	60	Alc. 67.5; Wat. 25; Glyc. 7.5.	200 Gm. Cinchona.
20	11.40	Cinchonæ Com- posita.	60	Alc. 85; Wat. 7.5; Glyc. 7.5.	100 Gm. Red Cinchona; 80 Gm. Bitter Or- ange Peel; 20 Gm. Serpentaria.
20	11.40	Cubebæ.	30	Alcohol.	200 Gm. Cubeb.
20	11.40	Gallæ.	40	Alc. 90; Glyc. 10.	200 Gm. Nutgall.
20	11.40	Guaiaci.	20	Alcohol.	200 Gm. Guaiac.
20	11.40	Guaiaci Ammo- niata.	20	Aromatic Spirit of Ammonia.	200 Gm. Guaiac.
20	11.40	Humuli.	20	Dil. Alcohol.	200 Gm. Hops.
20	11.40	Hydrastis.	60	Dil. Alcohol.	200 Gm. Hydrastis.
20	11.4	Ipecacuanhæ et Opii.	. .	Dil. Alcohol.	1000 C.c. Deodorized Tincture of Opium; 100 C.c. Fluid Ex- tract of Ipecac.
20	11.40	Kramerizæ.	40	Dil. Alcohol.	200 Gm. Krameria.
20	11.40	Lobellæ.	40	Dil. Alcohol.	200 Gm. Lobelia.
20	11.40	Myrrhæ.	40	Alcohol.	200 Gm. Myrrh.
20	11.40	Pyrethri.	40	Alcohol.	200 Gm. Pyrethrum.
20	11.40	Quillajæ.	Coarsely ground.	Alc. 35; Wat. 65.	200 Gm. Quillaja.
20	11.40	Valerianæ.	60	Alc. 75; Wat. 25.	200 Gm. Valerian.

Table of Tinctures, U. S. P.—(Continued.)

Number of Grammes of Active Agent or Drug in 100 Gm.	Total Number of Grains of Active Ingredients in a Fluidrachm.	Official Name.	Fineness of Powder.	Menstruum.	Ingredients in 1000 G.c.
20	11.40	Tinctura Valerianæ Ammoniata.	60	Aromatic Spirit of Ammonia.	200 Gm. Valerian.
20	11.40	Zingiberis.	40	Alcohol.	200 Gm. Ginger.
26	14.82	Benzoini Composita.	20	Alcohol.	120 Gm. Benzoin; 20 Gm. Purified Aloes; 80 Gm. Storax; 40 Gm. Balsam of Tolu.
30	17.11	Aloes.	50	Dil. Alcohol.	100 Gm. Purified Aloes; 200 Gm. Liquorice Root.
30	17.11	Aloes et Myrrhæ.	40	Alc. 75; Wat. 25.	100 Gm. Purified Aloes; 100 Gm. Myrrh; 100 Gm. Liquorice Root.
30	17.11	Rhei Aromatica.	40	Alc. 50; Wat. 40; Glyc. 10.	200 Gm. Rhubarb; 40 Gm. Cassia Cinnamon; 40 Gm. Cloves; 20 Gm. Nutmeg.
35	19.96	Aconiti.	60	Alc. 70; Wat. 30.	350 Gm. Aconite.
40	22.81	Veratri Viridis.	60	Alcohol.	400 Gm. Veratrum Viride.
50	28.52	Tincturæ Herbarum Recentium.	Bruised or crushed. 20	Alcohol.	500 Gm. Fresh Herb.
50	28.52	Tinctura Lactucarii.	20	Alcohol, Water, and Glycerin.	500 Gm. Lactucarium.

PRACTICAL PROCESSES FOR OFFICIAL TINCTURES.

TINCTURA ACONITI. U. S. Tincture of Aconite.

Aconite, in No. 60 powder 350 Gm. Old form. 11 oz. av. 300 gr.
 Alcohol,
 Water, each, a sufficient quantity,

To make 1000 C.c. 2 pints.

Mix Alcohol and Water in the proportion of 700 C.c. [old form 22½ fl. oz.] of Alcohol to 300 C.c. [old form 9½ fl. oz.] of Water. Having moistened the powder with 200 C.c. [old form 6½ fl. oz.] of menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ALOES. U. S. Tincture of Aloes.

Purified Aloes, in moderately fine powder 100 Gm. Old form. 3 oz. av. 148 gr.
 Liquorice Root, in No. 40 powder 200 Gm. 6 oz. av. 296 gr.
 Diluted Alcohol, a sufficient quantity,

To make 1000 C.c. 2 pints.

Mix the powders, and, having moistened the mixture with 80 C.c. [old form 2½ fl. oz.] of Diluted Alcohol, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ALOES ET MYRRHÆ. U.S. Tincture of Aloes and Myrrh.		
	Metric.	Old form.
Purified Aloes	100 Gm.	8 oz. av. 148 gr.
Myrrh	100 Gm.	8 oz. av. 148 gr.
Liquorice Root, in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix Alcohol and Water in the proportion of 750 C.c. [old form 24 fl. oz.] of Alcohol to 250 C.c. [old form 8 fl. oz.] of Water. Having mixed the Aloes, Myrrh, and Liquorice Root, reduce them to a moderately coarse No. 40 powder. Moisten the powder with 80 C.c. [old form 2 fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it moderately in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ARNICÆ FLORUM. U.S. Tincture of Arnica Flowers.		
	Metric.	Old form.
Arnica Flowers, in No. 20 powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Pack the powder firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ARNICÆ RADICIS. U.S. Tincture of Arnica Root.		
	Metric.	Old form.
Arnica Root, in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Moisten the powder with 150 C.c. [old form 5 fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it moderately in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ASAFÆTIDÆ. U.S. Tincture of Asafetida.		
	Metric.	Old form.
Asafetida, bruised	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the *Asafetida* with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and macerate for seven days, in a closed vessel; then filter through paper, adding, through the filter, enough Alcohol to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA AURANTII AMARI. U.S. Tincture of Bitter Orange Peel.

	Metric.	Old form.
Bitter Orange Peel, in No. 80 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		

Water, each, a sufficient quantity,

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix Alcohol and Water in the proportion of 600 C.c. [old form 19 fl. oz.] of Alcohol to 400 C.c. [old form 13 fl. oz.] of Water. Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it moderately in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA AURANTII DULCIS. U.S. Tincture of Sweet Orange Peel.

	Metric.	Old form.
Sweet Orange Peel, taken from the fresh fruit	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix the Orange Peel (which should be as free as possible from the inner, white layer), previously cut into small pieces, with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it moderately in a conical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA BELLADONNÆ FOLIORUM. U.S. Tincture of Belladonna Leaves.

[TINCTURA BELLADONNÆ, PHARM. 1880.]

	Metric.	Old form.
Belladonna Leaves, in No. 60 powder	150 Gm.	5 oz. av.
Diluted Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA BENZOINI. U.S. Tincture of Benzoin.

	Metric.	Old form.
Benzoin, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix the powder with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and macerate for seven days, in a closed vessel; then filter through paper, adding, through the filter, enough Alcohol to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA BENZOINI COMPOSITA. U.S. Compound Tincture of

	Benzoin.	
	Metric.	Old form.
Benzoin, in coarse powder	120 Gm.	4 oz. av.
Purified Aloes, in coarse powder	20 Gm.	292 grains.
Storax	80 Gm.	2 oz. av. 292 gr.
Balsam of Tolu	40 Gm.	1 oz. av. 146 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Benzoin, Aloes, Storax, and Balsam of Tolu with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and digest the mixture, at a temperature not exceeding 65° C. (149° F.), for two hours, in a closed vessel; then filter through paper, adding, through the filter, enough Alcohol to make the Tincture, when cold, measure 1000 C.c. [old form 2 pints].

TINCTURA BRYONIÆ. U.S. Tincture of Bryonia.

	Metric.	Old form.
Bryonia, recently dried, and in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CALENDULÆ. U.S. Tincture of Calendula.

	Metric.	Old form.
Calendula, in No. 20 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CALUMBÆ. U.S. Tincture of Calumba.

	Metric.	Old form.
Calumba, in No. 20 powder	100 Gm.	8 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 600 C.c. [old form 19 fl. oz.] of Alcohol to 400 C.c. [old form 13 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, macerate for twenty-four hours; then pack it in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CANNABIS INDICÆ. U. S. Tincture of Indian Cannabis.

	Metric.	Old form.
Indian Cannabis, in No. 40 powder	150 Gm.	5 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CANTHARIDIS. U. S. Tincture of Cantharides.

	Metric.	Old form.
Cantharides, in No. 60 powder	50 Gm.	780 grains.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 30 C.c. [old form 1 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CAPSICI. U. S. Tincture of Capsicum.

	Metric.	Old form.
Capsicum, in No. 80 powder	50 Gm.	780 grains.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 950 C.c. [old form 30 fl. oz.] of Alcohol to 50 C.c. [old form 2 fl. oz.] of Water. Having moistened the powder with 40 C.c. [old form 1½ fl. oz.] of the menstruum, pack it firmly in a cylindrical percolator; then gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CARDAMOMI. U. S. Tincture of Cardamom.

	Metric.	Old form.
Cardamom, in No. 80 powder	100 Gm.	3 oz. av. 148 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in

a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CARDAMOMI COMPOSITA. U.S. Compound Tincture of Cardamom.

	Metric.	Old form.
Cardamom	20 Gm.	292 grains.
Cassia Cinnamon	20 Gm.	292 grains.
Caraway	10 Gm.	146 grains.
Cochineal	5 Gm.	78 grains.
Glycerin	50 C.c.	1½ fl. oz.
Diluted Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix the Cardamom, Cinnamon, Caraway, and Cochineal, and reduce them to a moderately coarse (No. 40) powder. Having moistened the powder with 25 C.c. [old form 384 min.] of Diluted Alcohol, pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 950 C.c. [old form 30½ fl. oz.] of Tincture are obtained; then add the Glycerin, and mix them.

TINCTURA CATECHU COMPOSITA. U.S. Compound Tincture of Catechu.

	Metric.	Old form.
Catechu, in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Cassia Cinnamon, in No. 40 powder	50 Gm.	1 oz. av. 298 gr.
Diluted Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix the powders, and, without moistening, pack the mixture firmly in a cylindrical percolator; then gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CHIRATÆ. U.S. Tincture of Chirata.

	Metric.	Old form.
Chirata, in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3¼ fl. oz.] of the menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CIMICIFUGÆ. U.S. Tincture of Cimicifuga.

	Metric.	Old form.
Cimicifuga, in No. 60 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		

To make	1000 C.c.	2 pints.
-------------------	-----------	----------

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CINCHONÆ. U. S. Tincture of Cinchona.

	Metric.	Old form.
Cinchona, in No. 60 powder	200 Gm.	6 oz. av. 296 gr.
Glycerin	75 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Glycerin with 675 C.c. [old form 21½ fl. oz.] of Alcohol and 250 C.c. [old form 8 fl. oz.] of Water. Having moistened the powder with 200 C.c. [old form 6½ fl. oz.] of the menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical glass percolator, and pour on the remainder of the menstruum. When the liquid has disappeared from the surface, gradually pour on more of a mixture of Alcohol and Water, made in the same proportions as before, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CINCHONÆ COMPOSITA. U. S. Compound Tincture of Cinchona.

	Metric.	Old form.
Red Cinchona	100 Gm.	3 oz. av. 148 gr.
Bitter Orange Peel	80 Gm.	2 oz. av. 298 gr.
Serpentaria	20 Gm.	292 grains.
Glycerin	75 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Glycerin with 850 C.c. [old form 27 fl. oz.] of Alcohol and 75 C.c. [old form 2½ fl. oz.] of Water. Having mixed the Cinchona, Orange Peel, and Serpentina, reduce them to a fine (No. 60) powder. Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical glass percolator, and gradually pour on the remainder of the menstruum. When the liquid has disappeared from the surface, gradually pour on more of a mixture of Alcohol and Water, made in the same proportions as before, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CINNAMOMI. U. S. Tincture of Cinnamon.

	Metric.	Old form.
Ceylon Cinnamon, in No. 40 powder	100 Gm.	3 oz. av. 148 gr.
Glycerin	50 C.c.	1½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Glycerin with 750 C.c. [old form 24 fl. oz.] of Alcohol and 200 C.c. [old form 6½ fl. oz.] of Water. Having moistened the powder with 50 C.c. [old form 1½ fl. oz.] of the menstruum, pack it in a conical percolator, gradually pour on more of a mixture of Alcohol and Water, made in the same proportions as before, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA COLCHICI SEMINIS. U.S. Tincture of Colchicum Seed.

[TINCTURA COLCHICI, PHARM. 1880]

	Metric.	Old form.
Colchicum Seed, in No. 80 powder	150 Gm.	5 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 600 C.c. [old form 19 fl. oz.] of Alcohol and 400 C.c. [old form 13 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, macerate for twenty-four hours; then pack it moderately in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CROCI. U.S. Tincture of Saffron.

	Metric.	Old form.
Saffron	100 Gm.	8 oz. av. 148 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the Saffron with 100 C.c. [old form 3½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA CUBEBAE. U.S. Tincture of Cubeb.

	Metric.	Old form.
Cubeb, in No. 80 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA DIGITALIS. U.S. Tincture of Digitalis.

	Metric.	Old form.
Digitalis, in No. 60 powder	150 Gm.	5 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURÆ HERBARUM RECENTIUM. U.S. Tinctures of Fresh Herbs.

These Tinctures, when not otherwise directed, are to be prepared by the following formula:

Take of	Metric.	Old form.
The Fresh Herb, bruised or crushed	500 Gm.	17 oz. av.
Alcohol	1000 C.c.	2 pints.

Macerate the Herb with the Alcohol for fourteen days; then express the liquid and filter.

TINCTURA FERRI CHLORIDI. U.S. Tincture of Ferric Chloride.

A hydro-alcoholic solution of Ferric Chloride [$\text{Fe}_2\text{Cl}_6 = 823.98$] containing about 18.6 per cent. of the anhydrous salt, and corresponding to about 4.7 (4.69) per cent. of metallic iron.

	Metric.	Old form.
Solution of Ferric Chloride	250 C.c.	8 fl. oz.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Solution with enough Alcohol to make 1000 C.c. [old form 2 pints]. Let the Tincture stand, in a closely-covered vessel, at least three months; then transfer it to glass-stoppered bottles, and keep it protected from light.

A bright, brownish liquid, having a slightly ethereal odor, a very astringent, styptic taste, and an acid reaction.

Specific gravity: about 0.960 at 15° C. (59° F.).

The Tincture yields a brownish-red precipitate with ammonia water, a blue one with potassium ferrocyanide T. S., and a white one, insoluble in nitric acid, with silver nitrate T. S.

After the Tincture has been exposed for some time to daylight, it yields a greenish or greenish-blue color with potassium ferricyanide T. S., showing the presence of some ferrous salt, due to reduction.

If the iron be completely precipitated from a portion of the Tincture by an excess of ammonia water, the filtrate should be colorless, and should not yield a white or dark-colored precipitate with hydrogen sulphide T. S. (absence of *zinc* or *copper*), nor should it leave a fixed residue on evaporation and gentle ignition (absence of *salts of the fixed alkalies*.)

On adding a clear crystal of ferrous sulphate to a cooled mixture of equal volumes of concentrated sulphuric acid and a moderately dilute portion of the Tincture, the crystal should not become colored brown, nor should there be a brownish-black zone developed around it (absence of *nitric acid*).

On diluting 1 C.c. of the Tincture with water to 12 C.c., and boiling, the liquid should remain clear (absence of *oxychloride*).

If 1.12 (1.1176) Gm. of the Tincture be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T. S., it should require about 9.4 C.c. of decinormal sodium hyposulphite V. S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 0.5 per cent. of metallic iron).

TINCTURA GALLÆ. U. S. Tincture of Nutgall.

	Metric.	Old form.
Nutmall, in No. 40 powder	200 Gm.	6 oz. av. 296 gr.
Glycerin	100 C.c.	3½ fl. oz.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Glycerin with 900 C.c. [old form 28½ fl. oz.] of Alcohol. Pack the powder, without moistening it, in a conical glass percolator; then gradually pour upon it the menstruum, and, afterwards, Alcohol, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA GELSEMI. U. S. Tincture of Gelsemium.

	Metric.	Old form.
Gelsemium, in No. 60 powder	150 Gm.	5 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA GENTIANÆ COMPOSITA. U. S. Compound Tincture of Gentian.

	Metric.	Old form.
Gentian	100 Gm.	8 oz. av. 148 gr.
Bitter Orange Peel	40 Gm.	1 oz. av. 147 gr.
Cardamom	10 Gm.	146 grains.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Gentian, Orange Peel, and Cardamom, and reduce the mixture to a moderately coarse (No. 40) powder. Mix Alcohol and Water in the proportion of 600 C.c. [old form 19 fl. oz.] of Alcohol to 400 C.c. [old form 13 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3½ fl. oz.] of menstruum, macerate for twenty-four hours; then pack it in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA GUAIACI. U. S. Tincture of Guaiac.

	Metric.	Old form.
Guaiac, in coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints

Mix the powder with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and macerate for seven days, in a closed vessel; then filter through

paper, adding, through the filter, enough Alcohol to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA GUAIACI AMMONIATA. U.S. Ammoniated Tincture of Guaiac.

	Metric.	Old form.
Guaiac, in coarse powder	200 Gm.	6 oz. av. 296 gr.
Aromatic Spirit of Ammonia, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the powder with 800 C.c. [old form 25½ fl. oz.] of Aromatic Spirit of Ammonia, and macerate for seven days, in a closed vessel; then filter through paper, in a well-covered funnel, and add, through the filter, Aromatic Spirit of Ammonia, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA HUMULI. U.S. Tincture of Hops.

	Metric.	Old form.
Hops, well dried and in No. 20 powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 400 C.c. [old form 13 fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA HYDRASTIS. U.S. Tincture of Hydrastis.

	Metric.	Old form.
Hydrastis, in No. 60 powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA HYOSCYAMI. U.S. Tincture of Hyoscyamus.

	Metric.	Old form.
Hyoscyamus, in No. 60 powder	150 Gm.	5 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA IODI. U.S. Tincture of Iodine.

	Metric.	Old form.
Iodine	70 Gm.	255 grains.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	½ pint.

Triturate the Iodine rapidly, in a mortar, to a coarse powder, and transfer it at once to a graduated bottle. Rinse the mortar with several successive portions of Alcohol, and pour the rinsings into the bottle. Then add Alcohol, shaking the bottle occasionally, until the Iodine is dissolved, and the finished Tincture measures 1000 C.c. [old form $\frac{1}{2}$ pint]. (If there is no necessity for rapid solution, the unpowdered iodine may be placed in the bottle containing the Alcohol and allowed to dissolve slowly.)

If 6.8 C.c. of the Tincture be mixed with a solution of 2 Gm. of potassium iodide in 25 C.c. of water, and a little starch T. S. added, it should require, for complete decoloration, about 85 C.c. of decinormal sodium hyposulphite V. S. (corresponding to about 7 Gm. of iodine in 100 C.c.).

TINCTURA IPECACUANHÆ ET OPII. U. S. Tincture of Ipecac and Opium.

	Metric.	Old form.
Deodorized Tincture of Opium	1000 C.c.	10 fl. oz.
Fluid Extract of Ipecac	100 C.c.	1 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	10 fl. oz.

Evaporate the Deodorized Tincture of Opium, in a tared capsule, on a water-bath, until it weighs 800 Gm. [old form 8 oz. av.]. When it has become cold, add to it the Fluid Extract of Ipecac, filter the mixture, and pass enough Diluted Alcohol through the filter to make the Tincture measure 1000 C.c. [old form 10 fl. oz.].

TINCTURA KINO. U. S. Tincture of Kino.

	Metric.	Old form.
Kino	100 Gm.	365 grains.
Glycerin	150 C.c.	1 fl. oz. 96 min.
Water	200 C.c.	1 fl. oz. 288 min.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	$\frac{1}{2}$ pint.

Mix the Glycerin with the Water and 650 C.c. [old form 5 fl. oz.] of Alcohol. Rub the Kino, in a mortar, adding gradually a sufficient quantity of the menstruum, until a smooth paste is produced. Transfer this to a bottle, add the remainder of the menstruum, and macerate for twenty-four hours, with occasional agitation. Then filter through paper, adding, through the filter, enough Alcohol to make the product measure 1000 C.c. [old form $\frac{1}{2}$ pint]. Keep the Tincture in small, completely-filled and well-stoppered bottles, in a cool place.

TINCTURA KRAMERIÆ. U. S. Tincture of Krameria.

	Metric.	Old form.
Krameria, in No. 40 powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 200 C.c. [old form 6 $\frac{1}{2}$ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in

a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA LACTUCARII. U. S. Tincture of Lactucarium.

	Metric.	Old form.
Lactucarium	500 Gm.	16 oz. av. 802 gr.
Glycerin	250 C.c.	8 fl. oz.
Water,		
Alcohol,		
Benzin,		
Diluted Alcohol, each, a sufficient quantity.		

Beat the Lactucarium in an iron mortar, with clean sand, to a coarse powder, and introduce it into a bottle; add 2000 C.c. [old form 4 pints] of Benzin, cork the bottle tightly, and set it aside for forty-eight hours, frequently agitating the mixture. Pour the mixture on a double filter, and allow it to drain. Wash the residue by gradually adding 1500 C.c. [old form 40 fl. oz.] of Benzin. Allow the Lactucarium to dry by exposing it to a current of air. When it is dry, and free from the odor of Benzin, reduce it to powder, using more sand, if necessary, and pack it moderately in a conical percolator. Mix the Glycerin with 200 C.c. [old form 6½ fl. oz.] of Water, and 500 C.c. [old form 8 fl. oz.] of Alcohol, and moisten the powder with 500 C.c. [old form 8 fl. oz.] of the mixture. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed very slowly, gradually adding, first, the remainder of the menstruum, and then Diluted Alcohol, until the Lactucarium is exhausted. Reserve the first 750 C.c. [old form 24 fl. oz.] of the percolate, evaporate the remainder on a water-bath, at a temperature not exceeding 70° C. (158° F.), to 250 C.c. [old form 8 fl. oz.], and mix this with the reserved portion. Filter, and add enough Diluted Alcohol through the filter to make the product measure 1000 C.c. [old form 2 pints].

TINCTURA LAVANDULÆ COMPOSITA. U. S. Compound Tincture of Lavender.

[COMPOUND SPIRIT OF LAVENDER.]

	Metric.	Old form.
Oil of Lavender Flowers	8 C.c.	122 minims.
Oil of Rosemary	2 C.c.	81 minims.
Cassia Cinnamon, in coarse powder	20 Gm.	292 grains.
Cloves	5 Gm.	78 grains.
Nutmeg	10 Gm.	146 grains.
Red Saunders, in coarse powder	10 Gm.	146 grains.
Alcohol	700 C.c.	22½ fl. oz.
Water	250 C.c.	8 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Oils in the Alcohol, and add the Water. Crush the Nutmeg in a mortar, mix it with the Cinnamon, Cloves, and Red

Saunders, and reduce the mixture, by grinding, to a coarse (No. 20) powder. Moisten the mixture with a sufficient quantity of the alcoholic solution of the Oils, pack it firmly in a cylindrical percolator, gradually pour upon it the remainder of the alcoholic solution, and, afterwards, Diluted Alcohol, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA LOBELIÆ. U.S. Tincture of Lobelia.

	Metric.	Old form.
Lobelia, in No. 40 powder	200 Gm.	6 oz. av. 296 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA MATICO. U.S. Tincture of Matico.

	Metric.	Old form.
Matico, in No. 40 powder	100 Gm.	8 oz. av. 148 gr.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the Matico with 100 C.c. [old form 3½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA MOSCHI. U.S. Tincture of Musk.

	Metric.	Old form.
Musk	50 Gm.	865 grains.
Alcohol	450 C.c.	7½ fl. oz.
Water	450 C.c.	7½ fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	1 pint.

Rub the Musk in a mortar, first, with a little of the Water, until a smooth mixture is made, and then with the remainder of the Water. Transfer the whole to a bottle, add the Alcohol, and macerate the mixture for seven days, occasionally shaking the bottle. Then filter through paper, adding, through the filter, enough Diluted Alcohol to make the Tincture measure 1000 C.c. [old form 1 pint].

TINCTURA MYRRHÆ. U.S. Tincture of Myrrh.

	Metric.	Old form.
Myrrh, in moderately coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the powder with 800 C.c. [old form 25½ fl. oz.] of Alcohol, and macerate for seven days in a closed vessel; then filter through paper, adding, through the filter, enough Alcohol to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA NUCIS VOMICÆ. U.S. Tincture of Nux Vomica.

	Metric.	Old form.
Extract of Nux Vomica, dried at 100° C. (212° F.) .	20 Gm.	292 grains.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Extract of Nux Vomica (which should contain 15 per cent. of alkaloids) in a sufficient quantity of a mixture of 3 volumes of Alcohol and 1 volume of Water, to make the Tincture measure 1000 C.c. [old form 2 pints].

If 100 C.c. of Tincture of Nux Vomica be evaporated to dryness, and the residue tested by the process of assay given under *Extractum Nucis Vomice*, it should be found to contain 0.3 Gm. of alkaloids.

TINCTURA OPII. U.S. Tincture of Opium.

[LAUDANUM]

	Metric.	Old form.
Powdered Opium	100 Gm.	3 oz. av. 148 gr.
Precipitated Calcium Phosphate	50 Gm.	1 oz. av. 800 gr.
Water	400 C.c.	18 fl. oz.
Alcohol	400 C.c.	18 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Rub the powders in a mortar, with the Water previously heated to the temperature of 90° C. (194° F.), until a smooth mixture is made, and macerate for twelve hours; then add the Alcohol, mix thoroughly, and transfer the whole to a cylindrical percolator. Return to the percolator the first portion of the percolate, until it runs through clear, and, when the liquid ceases to drop, gradually pour on Diluted Alcohol, continuing the percolation slowly, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

If 100 C.c. of Tincture of Opium be assayed by the process immediately following, it should yield from 1.8 to 1.5 Gm. of crystallized morphine.

Assay of Tincture of Opium.

Tincture of Opium, one hundred cubic centimeters	100 C.c.
Ammonia Water, three and five-tenths cubic centimeters	3.5 C.c.
Alcohol,	
Ether,	
Water, each, a sufficient quantity.	

Evaporate the Tincture to about 20 C.c., add 40 C.c. of water, mix thoroughly, and set the liquid aside for an hour, occasionally stirring, and disintegrating the resinous flakes adhering to the capsule. Then filter, and wash the filter and residue with water, until all soluble matters are extracted, collecting the washings separately.

Evaporate in a tared capsule, first, the washings to a small volume, then add the first filtrate, and evaporate the whole to a weight of 14 Gm. Rotate the concentrated solution about in the capsule until the rings of extract are redissolved, pour the liquid into a tared Erlenmeyer flask having a capacity of about 100 C.c., and rinse the capsule with a few drops of water at a time, until the entire solution weighs 20 Gm. Then add 10 Gm. (or 12.2 C.c.) of alcohol, shake well, add 25 C.c. of ether, and shake again. Now add the ammonia water from a graduated pipette or burette, stopper the flask with a sound cork, shake it thoroughly during ten minutes, and then set it aside, in a moderately cool place, for at least six hours, or over night.

Remove the stopper carefully, and, should any crystals adhere to it, brush them into the flask. Place in a small funnel two rapidly-acting filters, of a diameter of 7 Cm., plainly folded, one within the other (the triple fold of the inner filter being laid against the single side of the outer filter), wet them well with ether, and decant the ethereal solution as completely as possible upon the inner filter. Add 10 C.c. of ether to the contents of the flask, rotate it, and again decant the ethereal layer upon the inner filter. Repeat this operation with another portion of 10 C.c. of ether. Then pour into the filter the liquid in the flask, in portions, in such a way as to transfer the greater portion of the crystals to the filter, and, when this has passed through, transfer the remaining crystals to the filter by washing the flask with several portions of water, using not more than about 10 C.c. in all. Allow the double filter to drain, then apply water to the crystals, drop by drop, until they are practically free from mother-water, and afterwards wash them, drop by drop, from a pipette, with alcohol previously saturated with powdered morphine. When this has passed through, displace the remaining alcohol by ether, using about 10 C.c., or more if necessary. Allow the filter to dry in a moderately warm place, at a temperature not exceeding 60° C. (140° F.), until its weight remains constant, then carefully transfer the crystals to a tared watch-glass and weigh them.

The weight found represents the amount of crystallized morphine obtained from 100 C.c. of the Tincture.

TINCTURA OPII CAMPHORATA. U. S. Camphorated Tincture of Opium.

[PAREGORIC.]

	Metric.	Old form.
Powdered Opium	4 Gm.	58½ grains.
Benzoic Acid	4 Gm.	58½ grains.
Camphor	4 Gm.	58½ grains.
Oil of Anise	4 C.c.	1 fl. dr.
Glycerin	40 C.c.	1½ fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Add 900 C.c. [old form 29 fl. oz.] of Diluted Alcohol to the other ingredients, contained in a suitable vessel, and macerate for three days, shaking frequently; then filter through paper, in a well-covered funnel, and pass enough Diluted Alcohol through the filter to make the product measure 1000 C.c. [old form 2 pints].

TINCTURA OPII DEODORATI. U. S. Tincture of Deodorized Opium.

[TINCTURA OPII DEODORATA, PHARM. 1880.]

	Metric.	Old form.
Powdered Opium	100 Gm.	8 oz. av. 148 gr.
Precipitated Calcium Phosphate	50 Gm.	1 oz. av. 800 gr.
Ether	200 C.c.	6½ fl. oz.
Alcohol	200 C.c.	6½ fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Rub the powders in a mortar with 400 C.c. [old form 13 fl. oz.] of Water previously heated to the temperature of 90° C. (194° F.), until a smooth mixture is made, and macerate for twelve hours; then pour the mixture on a filter, or transfer it to a cylindrical percolator, and gradually pour on Water, until the Opium is practically exhausted. Reduce the percolate, by evaporation on a water-bath, to 100 C.c. [old form 3½ fl. oz.], and, when it has cooled, shake it repeatedly with the Ether in a bottle. When the ethereal solution has separated by standing, pour it off, and evaporate the remaining liquid until all traces of Ether have disappeared. Mix the residue with 500 C.c. [old form 16 fl. oz.] of Water, and filter the mixture through paper. When the liquid has ceased to pass, add enough Water, through the filter, to make the filtered liquid measure 800 C.c. [old form 25½ fl. oz.]. Lastly, add the Alcohol, and mix them.

If 100 C.c. of Tincture of Deodorized Opium be assayed by the process given under *Tinctura Opii*, it should yield from 1.8 to 1.5 Gm. of crystallized morphine.

TINCTURA PHYSOSTIGMATIS. U. S. Tincture of Physostigma.

	Metric.	Old form.
Physostigma, in No. 40 powder	150 Gm.	5 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA PYRETHRI. U. S. Tincture of Pyrethrum.

	Metric.	Old form.
Pyrethrum, in No. 40 powder	200 Gm.	6 oz. av. 296 grains.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA QUASSIÆ. U. S. Tincture of Quassia.

	Metric.	Old form.
Quassia, in No. 40 powder	100 Gm.	3 oz. av. 148 grains.
Alcohol,		
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 350 C.c. [old form 11 fl. oz.] of Alcohol to 650 C.c. [old form 21 fl. oz.] of Water. Having moistened the powder with 100 C.c. [old form 3½ fl. oz.] of

the menstruum, macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA QUILLAJÆ. U.S. Tincture of Quillaja.

	Metrio.	Old form.
Quillaja, coarsely ground	200 Gm.	6 oz. av. 296 grains.
Alcohol	350 C.c.	11 fl. oz.
Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Boil the Quillaja, placed in a suitable vessel, with 800 C.c. [old form 25½ fl. oz.] of Water for fifteen minutes, strain, and wash the residue on the strainer with 100 C.c. [old form 3½ fl. oz.] of Water. Then boil the strained liquid down to 600 C.c. [old form 19 fl. oz.], allow it to cool, mix it with the Alcohol, and, when the insoluble matter has subsided, filter the liquid portion through paper, and add enough Water to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA RHEI. U.S. Tincture of Rhubarb.

	Metrio.	Old form.
Rhubarb	100 Gm.	8 oz. av. 148 grains.
Cardamom	20 Gm.	292 grains.
Glycerin	100 C.c.	3½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Rhubarb and Cardamom, and reduce the mixture to a moderately coarse (No. 40) powder. Mix the Glycerin with 600 C.c. [old form 19½ fl. oz.] of Alcohol and 300 C.c. [old form 9½ fl. oz.] of Water. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour on the remainder of the menstruum. When the liquid has disappeared from the surface, gradually pour on more of a mixture of Alcohol and Water, made in the same proportions as before, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA RHEI AROMATICA. U.S. Aromatic Tincture of Rhubarb.

	Metrio.	Old form.
Rhubarb	200 Gm.	6 oz. av. 296 grains.
Cassia Cinnamon	40 Gm.	1 oz. av. 148 grains.
Cloves	40 Gm.	1 oz. av. 148 grains.
Nutmeg	20 Gm.	292 grains.
Glycerin	100 C.c.	3½ fl. oz.
Alcohol,		
Water,		
Diluted Alcohol, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Rhubarb, Cinnamon, Cloves, and Nutmeg, and reduce the mixture to a moderately coarse (No. 40) powder. Mix the Glycerin with 500 C.c. [old form 16 fl. oz.] of Alcohol and 400 C.c. [old form 13 fl. oz.] of Water. Moisten the powder with 150 C.c. [old form 5 fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour on the remainder of the menstruum. When the liquid has disappeared from the surface, gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA RHEI DULCIS. U.S. Sweet Tincture of Rhubarb.

	Metric.	Old form.
Rhubarb	100 Gm.	8 oz. av. 148 grains.
Glycyrrhiza	40 Gm.	1 oz. av. 148 grains.
Anise	40 Gm.	1 oz. av. 148 grains.
Cardamom	10 Gm.	148 grains.
Glycerin	100 C.c.	3½ fl. oz.
Alcohol,		
Water,		
Diluted Alcohol, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Rhubarb, Glycyrrhiza, Anise, and Cardamom, and reduce the mixture to a moderately coarse (No. 40) powder. Mix the Glycerin with 500 C.c. [old form 16 fl. oz.] of Alcohol and 400 C.c. [old form 13 fl. oz.] of Water. Moisten the powder with 150 C.c. [old form 5 fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour on the remainder of the menstruum. When the liquid has disappeared from the surface, gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA SANGUINARIÆ. U.S. Tincture of Sanguinaria.

	Metric.	Old form.
Sanguinaria, in No. 60 powder	150 Gm.	5 oz. av.
Acetic Acid	20 C.c.	5 fl. dr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 600 C.c. [old form 19 fl. oz.] of Alcohol to 400 C.c. [old form 13 fl. oz.] of Water. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the mixture to which the Acetic Acid had previously been added, and macerate for twenty-four hours; then pack it firmly in a cylindrical glass percolator, gradually pour on more of a mixture of Alcohol and Water, made in the same proportions as before, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA SCILLÆ. U.S. Tincture of Squill.

	Metric.	Old form.
Squill, in No. 80 powder	150 Gm.	5 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 750 C.c. [old form 24 fl. oz.] of Alcohol to 250 C.c. [old form 8 fl. oz.] of Water. Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it moderately in a conical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA SERPENTARIÆ. U.S. Tincture of Serpentaria.

	Metric.	Old form.
Serpentaria, in No. 40 powder	100 Gm.	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA STRAMONII SEMINIS. U.S. Tincture of Stramonium Seed.

[TINCTURA STRAMONII, PHARM. 1880.]

	Metric.	Old form.
Stramonium Seed, in No. 40 powder	150 Gm.	5 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of Diluted Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Diluted Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA STROPHANTHI. U.S. Tincture of Strophanthus.

	Metric.	Old form.
Strophanthus, in No. 80 powder	50 Gm.	1 oz. av. 292 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Digest the powder with 70 C.c. [old form 2½ fl. oz.] of the menstruum for two days, then transfer it to a cylindrical percolator, gradually pour

menstruum upon it, and continue the percolation very slowly, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA SUMBUL. U.S. Tincture of Sumbul.

	Metric.	Old form.
Sumbul, in No. 30 powder	100 Gm.	3 oz. av. 148 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA TOLUTANA. U.S. Tincture of Tolu.

	Metric.	Old form.
Balsam of Tolu	100 Gm.	3 oz. av. 148 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Add the Balsam of Tolu to 900 C.c. [old form 29 fl. oz.] of Alcohol, and macerate until it is dissolved; then filter through paper, adding, through the filter, enough Alcohol to make the Tincture measure 1000 C.c. [old form 2 pints].

TINCTURA VALERIANÆ. U.S. Tincture of Valerian.

	Metric.	Old form.
Valerian, in No. 60 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 750 C.c. [old form 24 fl. oz.] of Alcohol to 250 C.c. [old form 8 fl. oz.] of Water. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA VALERIANÆ AMMONIATA. U.S. Ammoniated Tincture of Valerian.

	Metric.	Old form.
Valerian, in No. 60 powder	200 Gm.	6 oz. av. 296 gr.
Aromatic Spirit of Ammonia, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 200 C.c. [old form 6½ fl. oz.] of Aromatic Spirit of Ammonia, and macerate for twenty-four hours, in a closed

vessel; then pack it firmly in a cylindrical glass percolator, and gradually pour Aromatic Spirit of Ammonia upon it, keeping the percolator well covered, until 100 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA VANILLÆ. U.S. Tincture of Vanilla.

	Metric.	Old form.
Vanilla, cut into small pieces and bruised . . .	100 Gm.	3 oz. av. 148 gr.
Sugar, in coarse powder	200 Gm.	6 oz. av. 296 gr.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix Alcohol and Water in the proportion of 650 C.c. [old form 21 fl. oz.] of Alcohol to 350 C.c. [old form 11 fl. oz.] of Water. Macerate the Vanilla in 500 C.c. [old form 16 fl. oz.] of this mixture for twelve hours, then drain off the liquid, and set it aside. Transfer the Vanilla to a mortar, beat it with the Sugar into a uniform powder, then pack it in a percolator, and pour upon it the reserved liquid. When this has disappeared from the surface, gradually pour on menstruum, and continue the percolation, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA VERATRI VIRIDIS. U.S. Tincture of Veratrum Viride.

	Metric.	Old form.
Veratrum Viride, in No. 60 powder	400 Gm.	13 oz. av. 155 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the powder with 150 C.c. [old form 5 fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

TINCTURA ZINGIBERIS. U.S. Tincture of Ginger.

	Metric.	Old form.
Ginger, in No. 40 powder	200 Gm.	6 oz. av. 296 gr.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Moisten the Ginger with 50 C.c. [old form 1½ fl. oz.] of Alcohol, and macerate for twenty-four hours; then pack it firmly in a cylindrical percolator, and gradually pour Alcohol upon it, until 1000 C.c. [old form 2 pints] of Tincture are obtained.

Vina Medicata. Medicated Wines.

These are liquid preparations containing the soluble principles of medicinal substances dissolved in wine. Pharmaceutically they most resemble tinctures, differing from them merely in the character of the menstruum. The fermented juice of the grape, known officially as "vinum album," or "white wine," when brought to a definite alcoholic strength, is the menstruum used as the basis for medicated wines; and

wines have the advantage over infusions and decoctions of being much more permanent preparations, on account of the presence of alcohol.

The stability of medicated wines was greatly improved by the requirement of the U. S. P. 1880 that they should be made from stronger white wine, a menstruum containing from twenty to twenty-five per cent. of absolute alcohol by weight. The U. S. P. 1890 requires the addition of alcohol or of an alcoholic tincture to every medicated wine. It is apparent that more useful and permanent preparations could be made by substituting a menstruum composed of alcohol and water, and hence tinctures are preferable. Of the *ten* official wines, *two* are not medicated, *four* are made by solution or admixture, *two* by maceration, and *two* by percolation.

Table of the Official Wines.

Name.	Definition and Proportions.
Not Medicated.	
Vinum Album.	An alcoholic liquid, made by fermenting the juice of fresh grapes freed from seeds, stems, and skins.
Rubrum.	An alcoholic liquid, made by fermenting the juice of fresh, colored grapes, in presence of their skins.
Made by Solution.	
Vinum Antimonii.	4 Gm. Antimony and Potassium Tartrate; 65 C.c. Boiling Distilled Water; 150 C.c. Alcohol; White Wine, to make 1000 C.c.
Ferri Amarum.	50 Gm. Soluble Iron and Quinine Citrate; 150 C.c. Tincture of Sweet Orange Peel; 800 C.c. Syrup; White Wine, to make 1000 C.c.
Ferri Citratæ.	40 Gm. Iron and Ammonium Citrate; 150 C.c. Tincture of Sweet Orange Peel; 100 C.c. Syrup; White Wine, to make 1000 C.c.
Ipecacuanhæ.	100 C.c. Fluid Extract of Ipecac; 100 C.c. Alcohol; 800 C.c. White Wine.
Made by Maceration.	
Vinum Colchici Seminia.	150 Gm. Colchicum Seed; 150 C.c. Alcohol; White Wine, to make 1000 C.c.
Opii.	100 Gm. Powdered Opium; 10 Gm. Cassia Cinnamon; 10 Gm. Cloves; 150 C.c. Alcohol; White Wine, to make 1000 C.c.
Made by Percolation.	
Vinum Colchici Radicis.	400 Gm. Colchicum Root; 150 C.c. Alcohol; White Wine, to make 1000 C.c.
Ergotæ.	150 Gm. Ergot; 150 C.c. Alcohol; White Wine, to make 1000 C.c.

VINUM ALBUM. U. S. White Wine.

An alcoholic liquid, made by fermenting the juice of fresh grapes, the fruit of *Vitis vinifera* (nat. ord. *Vitaceæ*), freed from seeds, stems, and skins.

When White Wine is prescribed without further specification, it is recommended that a dry White Wine of domestic production (such as California Riesling, Ohio Catawba, etc.) be employed.

White Wine should be preserved in well-closed casks, filled as full as possible, or in well-stoppered bottles, in a cool place. It should contain not less than 10 nor more than 14 per cent., by weight (equivalent to 12.4 to 17.3 per cent. by volume), of absolute alcohol.

VINUM ANTIMONII. U. S. Wine of Antimony.

	Metric.	Old form.
Antimony and Potassium Tartrate	4 Gm.	58½ grains.
Boiling Distilled Water	65 C.c.	2 fl. oz.
Alcohol	150 C.c.	5 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Alcohol with 800 C.c. [old form 25½ fl. oz.] of White Wine. Dissolve the Antimony and Potassium Tartrate in the Boiling Distilled Water, and add the solution to the mixture. When the liquid is cold, filter it through paper, and add enough White Wine, through the filter, to make the product measure 1000 C.c. [old form 2 pints].

VINUM COLCHICI RADICIS. U. S. Wine of Colchicum Root.

	Metric.	Old form.
Colchicum Root, in No. 80 powder	400 Gm.	18 oz. av. 154 gr.
Alcohol	150 C.c.	5 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Alcohol with 850 C.c. [old form 27½ fl. oz.] of White Wine. Moisten the powder with 100 C.c. [old form 3½ fl. oz.] of the menstruum, pack it moderately in a conical glass percolator, and gradually pour upon it, first, the remainder of the menstruum, and afterwards enough White Wine to make the product measure 1000 C.c. [old form 2 pints].

VINUM COLCHICI SEMINIS. U. S. Wine of Colchicum Seed.

	Metric.	Old form.
Colchicum Seed, in No. 80 powder	150 Gm.	5 oz. av.
Alcohol	150 C.c.	5 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Alcohol with 850 C.c. [old form 27½ fl. oz.] of White Wine. Macerate the powder with 900 C.c. [old form 29 fl. oz.] of the mixture during seven days, in a closed vessel, with occasional agitation. Then filter through paper, adding, through the filter, first, the remainder of the menstruum, and afterwards enough White Wine to make the product measure 1000 C.c. [old form 2 pints].

VINUM ERGOTÆ. U. S. Wine of Ergot.

	Metric.	Old form.
Ergot, recently ground and in No. 80 powder	150 Gm.	5 oz. av.
Alcohol	150 C.c.	5 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Alcohol with 850 C.c. [old form 27½ fl. oz.] of White Wine. Moisten the powder with 40 C.c. [old form 1½ fl. oz.] of the mixture, pack it moderately in a conical glass percolator, and

gradually pour upon it, first, the remainder of the menstruum, and afterwards enough White Wine to make the product measure 1000 C.c. [old form 2 pints].

VINUM FERRI AMARUM. U.S. Bitter Wine of Iron.

	Metric.	Old form.
Soluble Iron and Quinine Citrate	50 Gm.	780 grains.
Tincture of Sweet Orange Peel	150 C.c.	5 fl. oz.
Syrup	300 C.c.	10 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Soluble Iron and Quinine Citrate in 500 C.c. [old form 16 fl. oz.] of White Wine. Add to this the Tincture of Sweet Orange Peel and the Syrup, and, lastly, enough White Wine to make the product measure 1000 C.c. [old form 2 pints]. Set the mixture aside for several days, then filter, and pass enough White Wine through the filter to restore the original volume.

VINUM FERRI CITRATIS. U.S. Wine of Ferric Citrate.

	Metric.	Old form.
Iron and Ammonium Citrate	40 Gm.	584 grains.
Tincture of Sweet Orange Peel	150 C.c.	5 fl. oz.
Syrup	100 C.c.	3½ fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Dissolve the Iron and Ammonium Citrate in 700 C.c. [old form 22½ fl. oz.] of White Wine. Add to this the Tincture of Sweet Orange Peel, and the Syrup, and, lastly, enough White Wine to make the product measure 1000 C.c. [old form 2 pints]. Set the mixture aside for several days, then filter, and pass enough White Wine through the filter to restore the original volume.

VINUM IPECACUANHÆ. U.S. Wine of Ipecac.

	Metric.	Old form.
Fluid Extract of Ipecac	100 C.c.	8½ fl. oz.
Alcohol	100 C.c.	8½ fl. oz.
White Wine	800 C.c.	25½ fl. oz.
To make	1000 C.c.	2 pints.

Mix them. Set the mixture aside for a few days, then filter.

VINUM OPII. U.S. Wine of Opium.

	Metric.	Old form.
Powdered Opium	100 Gm.	8 oz. av. 148 gr.
Cassia Cinnamon, in No. 60 powder	10 Gm.	146 grains.
Cloves, in No. 80 powder	10 Gm.	146 grains.
Alcohol	150 C.c.	5 fl. oz.
White Wine, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Alcohol with 850 C.c. [old form 27½ fl. oz.] of White Wine. To the mixed powders add 900 C.c. [old form 29 fl. oz.] of the menstruum, and macerate during seven days, with occasional

agitation. Then transfer the mixture to a filter, and, when the liquid has drained off, gradually pass through the filter, first, the remainder of the menstruum, and afterwards enough White Wine to make the product measure 1000 C.c. [old form 2 pints].

If 100 C.c. of Wine of Opium be assayed by the process given under *Tinctura Opii*, it should yield from 1.8 to 1.5 Gm. of crystallized morphine.

VINUM RUBRUM. U.S. Red Wine.

An alcoholic liquid, made by fermenting the juice of fresh, colored grapes, the fruit of *Vitis vinifera* (nat. ord. *Vitaceæ*), in presence of their skins.

When Red Wine is prescribed without further specification, it is recommended that a dry Red Wine of domestic production (such as a native Claret, Burgundy, etc.) be employed.

Red Wine should be preserved in well-closed casks filled as full as possible, or in well-stoppered bottles, in a cool place.

A deep red liquid, having a pleasant odor free from yeastiness, and a fruity, moderately astringent, pleasant, and slightly acidulous taste, without excessive sweetness or acidity.

The specific gravity, at 15.6° C. (60° F.), should not be less than 0.989, nor more than 1.010.

If a portion of Red Wine be evaporated, the residue, when dried during twelve hours on a water-bath, should not amount to less than 1.6 per cent., nor more than 8.5 per cent.

To neutralize 50 C.c. of Red Wine should require not less than 8 nor more than 5.2 C.c. of normal potassium hydrate V.S. (limit of *free acid*), eosin or fluorescein being used as indicator.

If 10 C.c. of Red Wine be diluted with an equal volume of water, and treated with 5 drops of ferric chloride T.S., the liquid should acquire a brownish-green color (due to *tannic acid*).

With lead acetate T.S., Red Wine forms a heavy precipitate which may vary in color from bluish-green to green.

If 2 C.c. of Red Wine be mixed, in a test-tube, with 2 drops of chloroform and 4 C.c. of normal potassium hydrate V.S., and the mixture carefully heated, the disagreeable odor of isonitril should not become perceptible (absence of *various aniline colors*).

If 50 C.c. of Red Wine be treated with a slight excess of ammonia water, the liquid should acquire a green or brownish-green color; if it be then well shaken with 25 C.c. of ether, the greater portion of the ethereal layer removed, and evaporated in a porcelain capsule with an excess of acetic acid and a few fibres of uncolored silk, the latter should not acquire a crimson or violet color (absence of *fuchsine*).

If 25 C.c. of Red Wine, heated to about 45° C. (113° F.), be well agitated with 25 Gm. of manganese dioxide, the liquid filtered off and acidulated with hydrochloric acid, it should not acquire a red color (absence of *sulpho-fuchsine*).

Tested by the following method, Red Wine should be found to contain not less than 10 nor more than 14 per cent., by weight (equivalent to 12.4 to 17.8 per cent. by volume), of absolute alcohol.

Extracta Fluida. Fluid Extracts.

Fluid extracts are liquid alcoholic preparations of uniform and definite strength, made by percolating drugs with menstrua, and concentrating a portion of the percolate so that in each case a cubic centimetre represents the medicinal virtues of one gramme of the drug: they are mostly concentrated tinctures. Fluid extracts were official for the first time in 1850, and the list was then made up of seven concentrated preparations, although but one of these could be called a fluid extract within the present meaning of the term: of the seven, two were oleoresins,

four were concentrated syrups, and but one was a concentrated tincture. Since 1850 the use of fluid extracts has increased to an enormous extent: the Pharmacopœia of 1890 contains formulas for *eighty-eight*, the number being greater than that of any other class of preparations in the work. Fluid extracts may be justly called "American preparations," and the advance made in pharmacy in this country within the last quarter of a century is largely due to the stimulus given by the studies in percolation and the demand for these useful liquids. The striking advantages possessed by fluid extracts are—1. Permanence. 2. Concentration. 3. The uniform relation existing between the fluid extract and the drug.

Permanence is secured by the adoption of alcoholic menstrua: formerly, sugar and glycerin were relied upon as preservatives, but continued experience has developed the value of alcohol, so that at present it is exclusively used as the antiseptic.

Concentration enables the physician to decrease the bulk of the dose, diminishing the volume of the preparation so that portability is secured. It also aids greatly in securing permanence.

The uniform relation existing between the fluid extract and the drug is of great assistance to the physician in fixing the dose, because, as one cubic centimetre is represented by one gramme, the dose of the fluid extract must be practically the same as that of the drug. It has also obvious advantages in arranging the formulas and working from them. The present strength of fluid extracts renders them five per cent. weaker than the fluid extracts of U. S. P. 1870: this is practically of no significance, so long as the drugs themselves are not brought to a standard to limit the amount of moisture or active principles present; for there would be more variation than five per cent. between different lots of the same drug, in these particulars: indeed, the proposition to make fluid extracts just half their present strength has met with favor from many able pharmacists, the principal arguments being that more thorough exhaustion can be secured by the ordinary operator upon the small scale, and that the fluid extracts can be made to represent the drug more accurately and honestly when *one hundred* parts by measure are made from *fifty* parts by weight of drug than when one hundred parts by measure are made from one hundred parts by weight of drug. The standard of strength of the official fluid extracts is based upon the theory that from a given weight of drug an amount of fluid extract shall be made equal in measure to the bulk of the same weight of distilled water; in other words, the relation is that of gramme to cubic centimetre.

Preparation.—Fluid extracts are made in several ways. The manufacturer generally adopts a different process from that directed by the Pharmacopœia, because upon the large scale some practical modifications are necessary; the finished preparation is, however, generally brought to the official standard. The processes at present in use may be classified as follows: 1. Percolation with partial evaporation (official). 2. Percolation with incomplete exhaustion. 3. Repercolation. 4. Vacuum maceration with percolation.

1. **Percolation with Partial Evaporation.**—This process can be best described by selecting from the official formulas one which will serve as an example.

Typical Formula for an Official Fluid Extract.

1000 Gm. of the powdered drug is moistened with a certain quantity of menstruum, packed in a suitable percolator, and enough menstruum added to saturate the powder and leave a stratum above it; the lower orifice of the percolator is closed when the liquid begins to drop, and the percolator is closely covered to prevent evaporation and permit maceration for a specified time; additional menstruum is poured on and percolation continued until the drug is exhausted. Usually about eight hundred C.c. of the first portion of the percolate is reserved, and the remainder evaporated at a temperature not exceeding 50° C. (122° F.) to a soft extract; this is to be dissolved in the reserved portion, and enough menstruum added to make the fluid extract measure 1000° C.c. The precipitation experienced heretofore when the evaporated weak percolate was added to the reserved portion is considerably diminished by causing the former to be evaporated to a soft extract. This precipitation, formerly noticed more particularly in alcoholic fluid extracts, was due to the volatility of the alcohol in the weak percolates, which, when evaporated, left the residue to a great extent aqueous; when this residue was added to the strongly alcoholic reserved portion, a precipitation of resinous and frequently of active matter took place, which necessitated the storing of the fluid extract until precipitation ceased, and subsequent filtration. This is almost altogether avoided by evaporating to a soft extract, and the loss of activity through precipitation thus greatly diminished.

The argument is frequently advanced that the application of heat is detrimental to solutions of organic principles, that it dissociates some, and always proves injurious to the desirable constituents, *and that no heat whatever should be used in making fluid extracts*: these views are undoubtedly correct, when considered in connection with a few special cases, but do not apply with any practical force to the moderate use of heat recommended by the official processes upon that portion of the percolate which represents the least active and least desirable constituents of the drug; for from seven-tenths to nine-tenths of the whole amount of percolate (frequently representing ninety-five per cent. of the activity of the drug) is reserved and is not subjected to heat at all.

2. Percolation with Incomplete Exhaustion.—This process consists in percolating a given weight of a drug with the proper menstruum in the usual manner, and stopping the percolation when an amount of percolate has been received which is equal to about three-fourths of the weight of the drug. To illustrate: 1000 grammes, or 16 ounces, of drug is percolated with the menstruum until 750 C.c., or 12 fluidounces, of percolate has been received; this is the complete process, and the residue containing absorbed menstruum is sacrificed. This method has the merit of saving time and labor, and avoiding evaporation with the necessary contact of heat. It is based on the assumption that when percolation is properly conducted the first seventy-five per cent. of percolate received contains at least seventy-five per cent. of the soluble and desirable principles of the drug, and that the wastage of alcohol comes chiefly from the effort to obtain the last twenty-five per cent. or less of soluble principles. In addition, this smaller amount of extrac-

tive matter in the weak percolate is said to be lessened in activity by the effects of the heat during the evaporation to recover the alcohol from it: hence the argument that in carefully-conducted operations the active matter left after receiving the percolate representing seventy-five per cent. of the drug, does not represent twenty-five per cent. of activity, but oftentimes less than ten per cent. The principal disadvantage of this method is that the *strength* of the finished fluid extract depends *entirely* upon the *skill* and *care* of the operator. If careful, in one operation he may obtain seventy-five per cent. of the active principles in the first seventy-five per cent. of percolate; in another case, circumstances may prevent his obtaining more than fifty per cent. of the active principles in the first seventy-five per cent. of percolate. By this method of making fluid extracts he cannot invariably secure uniformity, whilst in making fluid extracts by the official process a valuable check always exists,—i.e., *that percolation proceeds until exhaustion is reached, the weak percolate is evaporated at a limited temperature, and the soft extract is incorporated with the reserved portion*, so that imperfect percolation happening in the first part of the process is compensated for in the latter part, the only difference being that the weak percolate in this case contains a larger proportion of activity than if the operation had been thoroughly conducted from the first.

3. **Repercolation.**—This process, already treated of under the head of percolation (see page 280), is an improvement upon the method just noticed, because the drug is percolated to exhaustion, and evaporation obviated by storing away the weak percolate until the next operation upon the same drug, when it is used in the place of fresh menstruum. This process may be best explained by selecting a typical fluid extract and noting the details.

Fluid Extract of Cinchona by Repercolation (Squibb).—Take of Yellow Cinchona, in powder No. 50, 32 parts; Stronger Alcohol, sp. gr. .819, 2 parts; Glycerin, sp. gr. 1.250, 1 part; Water, 2 parts, or a sufficient quantity of menstruum.

Weigh the Stronger Alcohol, Glycerin, and Water in succession, in any convenient quantity at a time, into a tared bottle, and mix them thoroughly for a menstruum.

Moisten 8 parts of the Cinchona with 8 parts of the menstruum, by thoroughly mixing them, and allow the mixture to stand 8 hours in a closely-covered vessel. Then pass the moist powder through a No. 8 sieve, and pack it firmly in a percolator. Pour menstruum on top until the mass is filled with liquid and a stratum remains on top unabsorbed; cover the percolator closely, and macerate for 48 hours. Then arrange the percolator for an automatic supply of menstruum, and start the percolation at such a rate as to give 1 part of percolate in about 4 hours. Reserve the first 6 parts of percolate, and continue the percolation until the Cinchona is exhausted, separating the percolate received after the reserved portion into fractions of about 8 parts each.

Moisten a second portion of 8 parts of the Cinchona with 8 parts of the weak percolate,—the first portion that was obtained next after the reserved percolate,—and allow the moist powder to stand for 8 hours in a vessel closely covered. Then pack it moderately in a percolator, and

supply the percolator automatically with the remaining fractions of the weak percolate in the order in which they were received, and finally with fresh menstruum, until the Cinchona is exhausted. Percolate in the same manner and at the same rate as with the first portion of Cinchona, and, reserving 8 parts of the first percolate, separate the weaker percolate into fractions of about 8 parts each.

Percolate the third and fourth portions of 8 parts each of the Cinchona in the same way as the second portion.

Finally, mix the four reserved percolates together to make 30 parts of finished fluid extract; and, having corked, labelled, and numbered the bottles containing the fractions of weak percolate, set them away until the process for Cinchona is to be resumed.

When this fluid extract is to be again made, repeat the process as with the second portion, and reserve 8 parts of the first percolate as finished fluid extract from each 8 parts of Cinchona from that time forward so long as the fractions of weak percolate are carried forward with which to commence each operation.

Continuous Percolation.—Robert W. Beck has devised a modification of Dr. Squibb's method of repercolation with a view of rendering the process more suitable for the smaller operations carried on by retail pharmacists. The storing away of the last weak percolates, and

FIG. 344.

particularly the necessity for collecting the fractions of percolates, have operated to prevent repercolation from being used in small operations to the extent that it would be otherwise. Mr. Beck has sought to remove some of these disadvantages, and the illustration shown in Fig. 344 serves to render the explanations which follow more easily under-

stood. His process and apparatus effect a saving in time and attention, and the difficulty of keeping the percolators containing the drugs supplied with the proper menstruum at the time when the portion previously added has just disappeared, has been overcome; the watchfulness necessary to see that each receiving vessel does not overflow, or get more than its due proportion of the weaker extract or menstruum, is reduced to a minimum, and the constant changing of receiving-bottles is no longer required. The continuous method is based on the principle of *connecting* the receiving-bottles containing the weaker percolates or menstruum, and after this to join the series to the percolator containing the drug by a syphon-tube so that the menstrua will flow slowly and regularly, and that each portion will be delivered on the upper surface of the drug in its proper order.

The percolate is carried from one receiving-bottle, when full, to the next one by tubes inserted in the corks from the neck of one bottle to the neck of the other. Very little diffusion occurs, owing to the fact that the heavier liquids are drawn off first, and in each case a lighter liquid is deposited slowly (by drops) upon a denser one; as the same principle is employed in receiving the percolates, the bottle nearest the percolator is filled with very dense percolate, and when the bottle is as full as desired, the tube connecting with the next bottle draws off the light liquid as it is deposited on top, and practically no intermixture occurs. Of course, the same action takes place in the remaining bottles of the series. If desired, the reserve or strongest percolate or finished fluid extract contained in the first bottles of the series can be removed, their place being supplied by empty bottles, so that even the slight risk of diffusion would apply only to weak percolates. In Fig. 344 the percolator is connected with No. 1 bottle by a rubber tube having a pinch-cock to regulate the flow; the remaining bottles are all connected in proper order by means of glass tubes and rubber tubing, as shown, the ends of the glass tubes being adjusted so as to be on the same level. When No. 1 bottle is full of dense percolate No. 2 bottle begins to fill with weaker percolate, then No. 3 with still weaker percolate, and so on. From the top of the last bottle on the upper shelf (No. 8) a piece of rubber tubing is connected with a glass tube having an inside diameter of $\frac{1}{4}$ inch, which passes through the cover of the percolator, the lower end about $\frac{1}{8}$ inch above the surface of the drug. This device makes an automatic supply of menstruum, the latter ceasing to flow when the liquid rises in the percolator above the end of the supply-tube.

5. Vacuum Maceration followed by Percolation.—This method of making fluid extracts was proposed in 1869 by S. P. Duffield. His original process was to introduce the drug, ground to the requisite fineness, into a strong cylinder connected with an air-pump. The air was exhausted by the pump, and through a syphon-tube the requisite amount of menstruum was sucked into the vacuum-chamber. The air enclosed in the interstices and pores of the drug was thus expelled, and, the menstruum being brought immediately in contact with the soluble constituents, maceration was facilitated. The same process was suggested by Needles many years ago. Fig. 346 is an illustration of his original

apparatus, the vessel upon the right hand being the percolator and receiver, the pump for exhausting the receiver being connected by a short tube carrying a stop-cock. The most effective apparatus known to the author for using this principle upon the large scale is that devised by Wm. M. Thomson, of Philadelphia, and illustrated in the *American Journal of Pharmacy*, page 237, 1882. The percolators are egg-shaped, and made of tinned copper; they are capable of being tightly covered, and communicate with a very efficient double-acting air-pump by means of stop-cocks above and below, and iron and stout rubber tubing. The moistened powder is packed tightly in the percolator, and the cover securely bolted on. The stop-cock in the cover, communicating with the air-pump, is opened, and a partial vacuum created in the space above the moistened drug; it is then closed, and another stop-cock in the cover opened, which communicates by a tube with the reservoir containing the menstruum. The menstruum quickly penetrates the powder, taking the place of the interstitial air, and when the powder is saturated it is permitted to macerate *in vacuo* a sufficient length of time. To start percolation, a receiver is connected with the beak of the percolator, and the air exhausted from it. When the flow slackens, air may be forced by the pump into the space above the powder, and the receiver again exhausted below. In this way entire control of these powerful physical forces may be secured. The advantages are apparent in preventing the loss of alcohol and protecting from chemical change caused by exposure to the air. It is quite possible to make an official fluid extract without recourse to the subsequent evaporation of weak percolate.

Preservation of Fluid Extracts.—Very little trouble is experienced in keeping fluid extracts which have been properly made. They should be placed in glass vessels and stored in rooms of uniform temperature: precipitation to a greater or less extent will certainly take place. This is often especially noticeable in fluid extracts made during warm weather, and is due to the greater solvent action of the menstruum at higher temperatures. Precipitation is also caused by the variation in the strength of different portions of the menstruum in an alcoholic fluid extract: the first part of the percolate which is received contains the displaced water which was present as moisture in the powder, and the mixture of this with the strong alcoholic percolate which follows causes in time precipitation. The character of the precipitates should be ascertained: if active, they should be incorporated by shaking with the fluid extract; if inert, they should be filtered out.

FIG. 346.

Needle's vacuum percolator.

Official Fluid Extracts arranged in Classes according to the Alcoholic Strength of their Menstruums, with Manipulative Notes.

NAME.	Number of Cc. used to Moisten.	Menstruum.	Number of Cc. of Reserve.	Process and Remarks.
Class 1.				
Extractum Aromaticum Fluidum.	350	Alcohol.	850	From Aromatic Powder. Percolate with the menstruum directed until the drug is exhausted, reserving the number of C.c. set opposite each fluid extract in the proper column; evaporate or distil the rest of the percolate at a temperature not above 122° F. to a soft extract. Dissolve this in the reserved portion, and add sufficient Alcohol to make the whole measure 1000 C.c.

Class 9 (continued).				
		Containing Glycerin.		
Extractum Aspidospermatis.	400	Glycerin, 10 Alcohol, 60 Water, 30	800	Finish percolation with Alcohol, 2; Water, 1.
Hydnastis.	300	Glycerin, 10 Alcohol, 60 Water, 30	350	
Rub.	350	Glycerin, 10 Alcohol, 60 Water, 30	700	
Gerani.	350	Glycerin, 10 Dil. Alcohol, 60	700	Finish percolation with Diluted Alcohol.
Krameris.	400	Glycerin, 10 Dil. Alcohol, 60	700	
Rhois Glabra.	350	Glycerin, 10 Dil. Alcohol, 60	600	
Rosa.	400	Glycerin, 10 Dil. Alcohol, 60	750	
Hamamelidis.	350	Glycerin, 10 Alcohol, 60 Water, 30	850	Finish percolation with Alcohol, 5; Water, 8.
Sarsaparillae Compositum.	400	Glycerin, 10 Alcohol, 60 Water, 30	800	Finish percolation with Alcohol, 1; Water, 2.
Uvae Ursi.	400	Glycerin, 30 Alcohol, 20 Water, 50	900	Finish percolation with Alcohol, 2; Water, 5.
Pruni Virginianae.	300	Glycerin, 10 Alcohol, 85 Water, 35	800	Macerate with a mixture of 1 volume of Glycerin and 2 volumes of Water. Finish the percolation with a mixture of 17 volumes of Alcohol and 8 volumes of Water. Evaporate the weak percolate to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the whole measure 1000 Cc.
Class 20.				
		Boiling Water.		
Tritic.		" "		Percolate the Triticum with Boiling Water until exhausted, evaporate to 750 Cc., add 250 Cc. Alcohol, filter, and add enough of a mixture of 1 volume of Alcohol with 8 volumes of Water to make the whole measure 1000 Cc.
Castanea.		" "		Macerate the Castanea with Boiling Water, express, percolate residue to exhaustion; mix liquids, evaporate, when cool add Alcohol, decant, filter remainder, evaporate united liquids to 700 Cc.; add 100 Cc. Glycerin and 200 Cc. Alcohol.

PRACTICAL PROCESSES FOR FLUID EXTRACTS.

EXTRACTUM ACONITI FLUIDUM. U.S. Fluid Extract of Aconite.

	Metric.	Old form.
Aconite, in No. 60 powder.	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make.	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Aconite is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM APOCYNII FLUIDUM. U.S. Fluid Extract of Apocynum.

	Metric.	Old form.
Apocynum, in No. 60 powder.	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 minims.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 650 C.c. [old form 31 fl. oz.] of Alcohol and 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards a mixture of Alcohol and Water, made in the proportion of 650 C.c. [old form 31 fl. oz.] of Alcohol to 350 C.c. [old form 17 fl. oz.] of Water, until the Apocynum is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ARNICÆ RADICIS FLUIDUM. U. S. Fluid Extract of Arnica Root.

	Metric.	Old form.
Arnica Root, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Arnica Root is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM AROMATICUM FLUIDUM. U. S. Aromatic Fluid Extract.

	Metric.	Old form.
Aromatic Powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Aromatic Powder is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ASCLEPIADIS FLUIDUM. U. S. Fluid Extract of Asclepias.

	Metric.	Old form.
Asclepias, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate

for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Asclepias* is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ASPIDOSPERMATIS FLUIDUM. U.S. Fluid Extract of
Aspidosperma.

	Metric.	Old form.
Aspidosperma, in No. 60 powder.	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 884 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 600 C.c. [old form 29 fl. oz.] of Alcohol and 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then a mixture of Alcohol and Water, made in the proportion of 200 C.c. [old form 16 fl. oz.] of Alcohol to 100 C.c. [old form 8 fl. oz.] of Water, until the *Aspidosperma* is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM AURANTII AMARI FLUIDUM. U.S. Fluid Extract of
Bitter Orange Peel.

	Metric.	Old form.
Bitter Orange Peel, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it moderately in a conical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Orange Peel is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the

remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM BELLADONNÆ RADICIS FLUIDUM. U. S. Fluid Extract of Belladonna Root.

[EXTRACTUM BELLADONNÆ FLUIDUM, PHARM. 1880.]

	Metric.	Old form.
Belladonna Root, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 800 C.c. [old form 38½ fl. oz.] of Alcohol with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Belladonna Root is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM BUCHU FLUIDUM. U. S. Fluid Extract of Buchu.

	Metric.	Old form.
Buchu, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Buchu is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CALAMI FLUIDUM. U. S. Fluid Extract of Calamus.

	Metric.	Old form.
Calamus, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Calamus is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CALUMBÆ FLUIDUM. U.S. Fluid Extract of Calumba.

	Metric.	Old form.
Calumba, in No. 20 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		

To make	1000 C.c.	8 pints.
-------------------	-----------	----------

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Calumba is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CANNABIS INDICÆ FLUIDUM. U.S. Fluid Extract of Indian Cannabis.

	Metric.	Old form.
Indian Cannabis, in No. 20 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		

To make	1000 C.c.	8 pints.
-------------------	-----------	----------

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Indian Cannabis is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue, in a porcelain capsule, to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CAPSICI FLUIDUM. U. S. Fluid Extract of Capsicum.

	Metric.	Old form.
Capsicum, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 500 C.c. [old form 24 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Capsicum is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CASTANÆ FLUIDUM. U. S. Fluid Extract of Castanea.

	Metric.	Old form.
Castanea, in No. 80 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Pour 5000 C.c. [old form 15 pints] of boiling Water upon the powder, allow it to macerate for two hours, then express the liquid, transfer the residue to a percolator, and pour Water upon it until the powder is exhausted. Evaporate the united liquids, on a water-bath, to 2000 C.c. [old form 6 pints], allow this to cool, and add 600 C.c. [old form 29 fl. oz.] of Alcohol. When the insoluble matter has subsided, separate the clear liquid, filter the remainder, evaporate the united liquids to 700 C.c. [old form 33½ fl. oz.], allow this to cool, add the Glycerin, and enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CHIMAPHILÆ FLUIDUM. U. S. Fluid Extract of Chimaphila.

	Metric.	Old form.
Chimaphila, in No. 80 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Chimaphila is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate, and evaporate the

remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CHIRATÆ FLUIDUM. U.S. Fluid Extract of Chirata.

	Metric.	Old form.
Chirata, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		

To make	1000 C.c.	8 pints.
-------------------	-----------	----------

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Chirata is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CIMICIFUGÆ FLUIDUM. U.S. Fluid Extract of
Cimicifuga.

	Metric.	Old form.
Cimicifuga, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		

To make	1000 C.c.	8 pints.
-------------------	-----------	----------

Moisten the powder with 250 C.c. [old form 12 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Cimicifuga is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CINCHONÆ FLUIDUM. U.S. Fluid Extract of Cinchona.

	Metric.	Old form.
Cinchona, in No. 60 powder	1000 Gm.	50 oz. av.
Glycerin	200 C.c.	9 fl. oz. 288 min.
Alcohol,		
Water, each, a sufficient quantity,		

To make	1000 C.c.	8 pints.
-------------------	-----------	----------

Mix the Glycerin with 800 C.c. [old form 38½ fl. oz.] of Alcohol. Moisten the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator, and pour on the remainder of the menstruum. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, and when the liquid in the percolator has disappeared from the surface, gradually pour on a mixture of Alcohol and Water, made in the proportion of 800 C.c. [old form 38½ fl. oz.] of Alcohol to 200 C.c. [old form 9½ fl. oz.] of Water, and continue the percolation until the Cinchona is exhausted. Reserve the first 750 C.c. [old form 36 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough of a mixture of Alcohol and Water, using the same proportions as before, to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM COCÆ FLUIDUM. U. S. Fluid Extract of Coca.

	Metric.	Old form.
Coca, in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 450 C.c. [old form 21½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Coca is exhausted. Reserve the first 800 C.c. [old form 38 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM COLCHICI RADICIS FLUIDUM. U. S. Fluid Extract of Colchicum Root.

	Metric.	Old form.
Colchicum Root, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it moderately in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Colchicum Root is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the

percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM COLCHICI SEMINIS FLUIDUM. U.S. Fluid Extract of Colchicum Seed.

	Metric.	Old form.
Colchicum Seed, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Colchicum Seed is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CONII FLUIDUM. U.S. Fluid Extract of Conium.

	Metric.	Old form.
Conium, in No. 40 powder	1000 Gm.	50 oz. av.
Acetic Acid	20 C.c.	1 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Acetic Acid with 980 C.c. [old form 47 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Conium is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CONVALLARIÆ FLUIDUM. U.S. Fluid Extract of Convallaria.

	Metric.	Old form.
Convallaria, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Convallaria* is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CUBEÆ FLUIDUM. U.S. Fluid Extract of Cube.

	Metric.	Old form.
Cubeb, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 200 C.c. [old form 9½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Cube is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CUSSO FLUIDUM. U.S. Fluid Extract of Kousso.

[EXTRACTUM BRAYERÆ FLUIDUM, PHARM. 1880.]

	Metric.	Old form.
Kousso, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Kousso is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM CYPRIPIEDII FLUIDUM. U.S. Fluid Extract of
Cypripedium.

	Metric.	Old form.
Cypripedium, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Cypripedium* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM DIGITALIS FLUIDUM. U.S. Fluid Extract of *Digitalis*.

	Metric.	Old form.
Digitalis, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the *Digitalis* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM DULCAMARÆ FLUIDUM. U.S. Fluid Extract of *Dulcamara*.

	Metric.	Old form.
Dulcamara, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Dulcamara* is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ERGOTÆ FLUIDUM. U. S. Fluid Extract of Ergot.

	Metric.	Old form.
Ergot, recently ground and in No. 60 powder	1000 Gm.	50 oz. av.
Acetic Acid	20 C.c.	1 fl. oz.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Acetic Acid with 980 C.c. [old form 47 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough of the mixture to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Ergot is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ERIODICTYI FLUIDUM. U. S. Fluid Extract of Eriodictyon,

	Metric.	Old form.
Eriodictyon, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 800 C.c. [old form 38½ fl. oz.] of Alcohol with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Eriodictyon is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM EUCALYPTI FLUIDUM. U. S. Fluid Extract of Eucalyptus.

	Metric.	Old form.
Eucalyptus, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Eucalyptus is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM EUPATORII FLUIDUM. U.S. Fluid Extract of Eupatorium.

	Metric.	Old form.
Eupatorium, in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,	/	
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Eupatorium is exhausted. Reserve the first 800 C.c. [old form 38 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM FRANGULÆ FLUIDUM. U.S. Fluid Extract of Frangula.

	Metric.	Old form.
Frangula, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 500 C.c. [old form 24 fl. oz.] of Alcohol with 800 C.c. [old form 38½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Frangula is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved

portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GELSEMII FLUIDUM. U.S. Fluid Extract of
Gelsemium.

	Metric.	Old form.
Gelsemium, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Gelsemium is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GENTIANÆ FLUIDUM. U.S. Fluid Extract of Gentian.

	Metric.	Old form.
Gentian, in No. 80 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Gentian is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GERANII FLUIDUM. U.S. Fluid Extract of Geranium.

	Metric.	Old form.
Geranium, in No. 30 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 900 C.c. [old form 43 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough of the menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator,

macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards Diluted Alcohol, until the Geranium is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GLYCYRRHIZÆ FLUIDUM. U. S. Fluid Extract of Glycyrrhiza.

	Metric.	Old form.
Glycyrrhiza, in No. 40 powder	1000 Gm.	50 oz. av.
Ammonia Water	50 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Ammonia Water with 300 C.c. [old form 14½ fl. oz.] of Alcohol and 650 C.c. [old form 31 fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then a mixture of Alcohol and Water made in the proportion of 300 C.c. [old form 14½ fl. oz.] of Alcohol and 650 C.c. [old form 31 fl. oz.] of Water, until the Glycyrrhiza is exhausted. Reserve the first 750 C.c. [old form 36 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough of the mixture of Alcohol and Water to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GOSSYPII RADICIS FLUIDUM. U. S. Fluid Extract of Cotton Root Bark.

	Metric.	Old form.
Cotton Root Bark, in No. 80 powder	1000 Gm.	50 oz. av.
Glycerin	250 C.c.	12 fl. oz.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 750 C.c. [old form 36 fl. oz.] of Alcohol, and, having moistened the powder with 500 C.c. [old form 24 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then Alcohol, until the Cotton Root Bark is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate, and evaporate the remainder to a

soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GRINDELIAE FLUIDUM. U. S. Fluid Extract of Grindelia.

	Metric.	Old form.
Grindelia, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Grindelia is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM GUARANÆ FLUIDUM. U. S. Fluid Extract of Guarana.

	Metric.	Old form.
Guarana, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 200 C.c. [old form 9½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Guarana is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM HAMAMELIDIS FLUIDUM. U. S. Fluid Extract of Hamamelis.

	Metric.	Old form.
Hamamelis, in No. 40 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 500 C.c. [old form 24 fl. oz.] of Alcohol and 800 C.c. [old form 38½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a conical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then a mixture of Alcohol and Water, made in the proportion of 500 C.c. [old form 24 fl. oz.] of Alcohol to 800 C.c. [old form 38½ fl. oz.] of Water, until the Hamamelis is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM HYDRASTIS FLUIDUM. U.S. Fluid Extract of
Hydrastis.

	Metric.	Old form.
Hydrastis, in No. 60 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Mix the Glycerin with 600 C.c. [old form 29 fl. oz.] of Alcohol and 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then a mixture of Alcohol and Water, made in the proportion of 600 C.c. [old form 29 fl. oz.] of Alcohol to 300 C.c. [old form 14½ fl. oz.] of Water, until the Hydrastis is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM HYOSCYAMI FLUIDUM. U.S. Fluid Extract of
Hyoscyamus.

	Metric.	Old form.
Hyoscyamus, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Mix 2000 C.c. [old form 6 pints] of Alcohol with 1000 C.c. [old form 3 pints] of Water, and, having moistened the powder with 400

C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Hyoscyamus is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM IPECACUANHÆ FLUIDUM. U.S. Fluid Extract of Ipecac.

	Metric.	Old form.
Ipecac, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Ipecac is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM IRIDIS FLUIDUM. U.S. Fluid Extract of Iris.

	Metric.	Old form.
Iris, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Iris is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue, on a water-bath, to a soft

extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM KRAMERIE FLUIDUM. U.S. Fluid Extract of Krameria.

	Metric.	Old form.
Krameria, in No. 80 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 900 C.c. [old form 43 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards Diluted Alcohol, until the Krameria is exhausted. Reserve the first 700 C.c. [old form 34 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM LAPPÆ FLUIDUM. U.S. Fluid Extract of Lappa.

	Metric.	Old form.
Lappa, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Lappa is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM LEPTANDRÆ FLUIDUM. U.S. Fluid Extract of Leptandra.

	Metric.	Old form.
Leptandra, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it moderately in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the *Leptandra* is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM LOBELIÆ FLUIDUM. U. S. Fluid Extract of Lobelia.

	Metric.	Old form.
Lobelia, in No. 60 powder.	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 850 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Lobelia* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM LUPULINI FLUIDUM. U. S. Fluid Extract of Lupulin.

	Metric.	Old form.
Lupulin	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the Lupulin with 200 C.c. [old form 9½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the Lupulin and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Lupulin is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM MATICO FLUIDUM. U.S. Fluid Extract of Matico.

	Metric.	Old form.
Matico, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Matico is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM MENISPERMI FLUIDUM. U.S. Fluid Extract of Menispermum.

	Metric.	Old form.
Menispermum, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Menispermum is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM MEZEREI FLUIDUM. U.S. Fluid Extract of Mezereum.

	Metric.	Old form.
Mezereum, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alco-

hol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the *Mezereum* is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM NUCIS VOMICÆ FLUIDUM. U.S. Fluid Extract of
Nux Vomica.

	Metric.	Old form.
<i>Nux Vomica</i> , in No. 60 powder	1000 Gm.	50 oz. av.
Acetic Acid	50 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity.		

Mix Alcohol and Water in the proportion of 750 C.c. [old form 36 fl. oz.] of Alcohol and 250 C.c. [old form 12 fl. oz.] of Water. Moisten the powder with 1000 C.c. [old form 3 pints] of the mixture, to which the Acetic Acid had previously been added, and let it digest, in a well-covered vessel, in a warm place, during forty-eight hours. Then pack it in a cylindrical glass percolator, and gradually pour menstruum upon it, until the *Nux Vomica* is practically exhausted. Distil off the Alcohol by means of a water-bath, transfer the remainder to a tared capsule, evaporate it until it weighs about 200 Gm. [old form 10 oz. av.], and allow it to become cold. Then determine the weight exactly, remove 4 Gm. of the mass, and assay this by the process given under Extract of *Nux Vomica* (see *Extractum Nucis Vomicae*), using the amounts of liquids there directed for 2 Gm. of dry extract. From the results thus obtained ascertain, by calculation, the amount of total alkaloids in the remainder of the mass, and then add to the latter, first, 300 C.c. [old form 14½ fl. oz.] of Alcohol, and afterwards a sufficient quantity of a mixture of 3 volumes of Alcohol and 1 volume of Water, so that each 100 C.c. of the finished fluid extract shall contain 1.5 Gm. of total alkaloids.

EXTRACTUM PAREIRÆ FLUIDUM. U.S. Fluid Extract of *Pareira*.

	Metric.	Old form.
<i>Pareira</i> , in No. 40 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 884 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 720 C.c. [old form 34½ fl. oz.] of Alcohol and 180 C.c. [old form 8½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it

firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards a mixture of Alcohol and Water, made in the proportion of 400 C.c. [old form 20 fl. oz.] of Alcohol to 100 C.c. [old form 5 fl. oz.] of Water, until the Pareira is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM PHYTOLACCÆ RADICIS FLUIDUM. U.S. Fluid

Extract of Phytolacca Root.

	Metric.	Old form.
Phytolacca Root, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 600 C.c. [old form 29 fl. oz.] of Alcohol with 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Phytolacca Root is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM PILOCARPI FLUIDUM. U.S. Fluid Extract of Pilocarpus.

	Metric.	Old form.
Pilocarpus, in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually

adding Diluted Alcohol, until the *Pilocarpus* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM PODOPHYLLI FLUIDUM. U.S. Fluid Extract of Podophyllum.

	Metric.	Old form.
Podophyllum, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 800 C.c. [old form 38½ fl. oz.] of Alcohol with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Podophyllum is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate. Distill off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM PRUNI VIRGINIANÆ FLUIDUM. U.S. Fluid Extract of Wild Cherry.

	Metric.	Old form.
Wild Cherry, in No. 20 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 884 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with the mixture, pack it firmly in a cylindrical glass percolator, and, having closely covered the percolator, macerate for forty-eight hours; then gradually add menstruum, made in the proportion of 850 C.c. [old form 41 fl. oz.] of Alcohol to 150 C.c. [old form 7 fl. oz.] of Water, and allow the percolation to proceed until the Wild Cherry is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM QUASSIÆ FLUIDUM. U. S. Fluid Extract of Quassia.

	Metric.	Old form.
Quassia, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 300 C.c. [old form 14½ fl. oz.] of Alcohol with 600 C.c. [old form 29 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Quassia is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM RHAMNI PURSHIANÆ FLUIDUM. U. S. Fluid Extract of Rhamnus Purshiana.

	Metric.	Old form.
Rhamnus Purshiana, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Rhamnus Purshiana is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM RHEI FLUIDUM. U. S. Fluid Extract of Rhubarb.

	Metric.	Old form.
Rhubarb, in No. 80 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 800 C.c. [old form 38 fl. oz.] of Alcohol with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a conical percolator; then add enough menstruum to saturate the powder

and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Rhubarb is exhausted. Reserve the first 750 C.c. [old form 36 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 70° C. (158° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM RHOIS GLABRÆ FLUIDUM. U. S. Fluid Extract of
Rhus Glabra.

	Metric.	Old form.
Rhus Glabra, in No. 40 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 884 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 900 C.c. [old form 43 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards Diluted Alcohol, until the Rhus Glabra is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ROSÆ FLUIDUM. U. S. Fluid Extract of Rose.

	Metric.	Old form.
Red Rose, in No. 30 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 884 min.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 900 C.c. [old form 43 fl. oz.] of Diluted Alcohol, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards Diluted Alcohol, until the Red Rose is exhausted. Reserve the first 750 C.c. [old form 36 fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion,

and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM RUBI FLUIDUM. U. S. Fluid Extract of Rubus.

	Metric.	Old form.
Rubus, in No. 60 powder	1000 Gm.	50 oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 600 C.c. [old form 29 fl. oz.] of Alcohol and 300 C.c. [old form 14½ fl. oz.] of Water, and, having moistened the powder with 350 C.c. [old form 17 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards a mixture of Alcohol and Water, made in the proportion of 600 C.c. [old form 28 fl. oz.] of Alcohol to 300 C.c. [old form 14 fl. oz.] of Water, until the Rubus is exhausted. Reserve the first 700 C.c. [old form 33½ fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough of a mixture of Alcohol and Water, using the last-named proportions, to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM RUMICIS FLUIDUM. U. S. Fluid Extract of Rumex.

	Metric.	Old form.
Rumex, in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Rumex is exhausted. Reserve the first 800 C.c. [old form 39 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SABINÆ FLUIDUM. U. S. Fluid Extract of Savine.

	Metric.	Old form.
Savine, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 250 C.c. [old form 12 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Sarsaparilla is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SANGUINARIÆ FLUIDUM. U. S. Fluid Extract of Sanguinaria.

	Metric.	Old form.
Sanguinaria, in No. 60 powder.	1000 Gm.	50 oz. av.
Acetic Acid	50 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make.	1000 C.c.	8 pints.

Mix Alcohol and Water in the proportion of 750 C.c. [old form 36 fl. oz.] of Alcohol and 250 C.c. [old form 12 fl. oz.] of Water. Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, to which the Acetic Acid had previously been added, and let it macerate, in a well-covered vessel, in a warm place, during forty-eight hours. Then pack it firmly in a cylindrical percolator, and gradually pour menstruum upon it, until the Sanguinaria is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SARSAPARILLÆ FLUIDUM. U. S. Fluid Extract of Sarsaparilla.

	Metric.	Old form.
Sarsaparilla, in No. 80 powder.	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make.	1000 C.c.	8 pints.

Mix 300 C.c. [old form 14½ fl. oz.] of Alcohol with 600 C.c. [old form 29 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Sarsaparilla is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and

evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SARSAPARILLÆ FLUIDUM COMPOSITUM. U. S.

Compound Fluid Extract of Sarsaparilla.

	Metric.	Old form.
Sarsaparilla, in No. 80 powder	750 Gm.	87½ oz. av.
Glycyrrhiza, in No. 80 powder	120 Gm.	6 oz. av.
Sassafras, in No. 80 powder	100 Gm.	5 oz. av.
Mezereum, in No. 80 powder	30 Gm.	1½ oz. av.
Glycerin	100 C.c.	4 fl. oz. 384 min.
Alcohol,		
Water, each, a sufficient quantity,		

To make 1000 C.c.

8 pints.

Mix the Glycerin with 300 C.c. [old form 14½ fl. oz.] of Alcohol and 600 C.c. [old form 29 fl. oz.] of Water, and, having moistened the mixed powders with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards a mixture of Alcohol and Water, made in the proportion of 300 C.c. [old form 14½ fl. oz.] of Alcohol to 600 C.c. [old form 29 fl. oz.] of Water, until the powder is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough of a mixture of Alcohol and Water, using the last-named proportions, to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SCILLÆ FLUIDUM. U. S. Fluid Extract of Squill.

	Metric.	Old form.
Squill, in No. 20 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		

To make 1000 C.c.

8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 200 C.c. [old form 9½ fl. oz.] of the mixture, pack it in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Squill is exhausted. Reserve the first 750 C.c. [old form 36 fl. oz.] of the percolate, and evaporate the

remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SCOPARII FLUIDUM. U.S. Fluid Extract of Scoparius.

	Metric.	Old form.
Scoparius, in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, using the same proportions of Alcohol and Water as before, until the Scoparius is exhausted. Reserve the first 350 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SCUTELLARIÆ FLUIDUM. U.S. Fluid Extract of Scutellaria.

	Metric.	Old form.
Scutellaria, in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 350 C.c. [old form 17 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Scutellaria is exhausted. Reserve the first 300 C.c. [old form 38 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SENEGÆ FLUIDUM. U.S. Fluid Extract of Senega.

	Metric.	Old form.
Senega, in No 40 powder	1000 Gm.	50 oz. av.
Ammonia Water	50 C.c.	2½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Ammonia Water with 750 C.c. [old form 36 fl. oz.] of Alcohol and 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 450 C.c. [old form 21½ fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then a mixture of Alcohol and Water, made in the proportion of 750 C.c. [old form 36 fl. oz.] of Alcohol to 250 C.c. [old form 12 fl. oz.] of Water, until the Senega is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, to a soft extract; dissolve this in the reserved portion, and add enough of the last-mentioned mixture of Alcohol and Water to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SENNÆ FLUIDUM. U.S. Fluid Extract of Senna.

	Metric.	Old form.
Senna, in No. 80 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 400 C.c. [old form 19 fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Senna is exhausted. Reserve the first 800 C.c. [old form 38½ fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

**EXTRACTUM SERPENTARIÆ FLUIDUM. U.S. Fluid Extract of
Serpentaria.**

	Metric.	Old form.
Serpentaria, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 800 C.c. [old form 38 fl. oz.] of Alcohol with 200 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the

same proportions of Alcohol and Water as before, until the *Serpentaria* is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM SPIGELIÆ FLUIDUM. U.S. Fluid Extract of *Spigelia*.

	Metric.	Old form.
<i>Spigelia</i> , in No. 60 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Spigelia* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM STILLINGIÆ FLUIDUM. U.S. Fluid Extract of *Stillingia*.

	Metric.	Old form.
<i>Stillingia</i> , in No. 40 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the *Stillingia* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM STRAMONII SEMINIS FLUIDUM. U.S. Fluid Extract of *Stramonium Seed*.

[EXTRACTUM STRAMONII FLUIDUM, PHARM. 1880.]

	Metric.	Old form.
<i>Stramonium Seed</i> , in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	3 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 200 C.c. [old form 9½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Stramonium Seed is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM TARAXACI FLUIDUM. U.S. Fluid Extract of
Taraxacum.

	Metric.	Old form.
Taraxacum, in No. 30 powder	1000 Gm.	50 oz. av.
Diluted Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Taraxacum is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate; distil off the Alcohol from the remainder by means of a water-bath, and evaporate the residue to a soft extract; dissolve this in the reserved portion, and add enough Diluted Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM TRITICI FLUIDUM. U.S. Fluid Extract of Triticum.

	Metric.	Old form.
Triticum, finely cut.	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Pack the Triticum in a cylindrical percolator, pour Boiling Water upon it, and allow the percolation to proceed, supplying boiling water, as required, until the Triticum is exhausted. Evaporate the percolate to 750 C.c. [old form 36 fl. oz.], and, having added to it 250 C.c. [old form 12 fl. oz.] of Alcohol, mix well and set it aside for forty-eight hours. Then filter the liquid and add to the filtrate enough of a mixture of Alcohol and Water made in the proportion of 1 volume of

Alcohol to 3 volumes of Water to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM UVÆ URSI FLUIDUM. U.S. Fluid Extract of Uva Ursi.

	Metric.	Old form.
Uva Ursi, in No. 80 powder	1000 Gm.	50 oz. av.
Glycerin	300 C.c.	14½ fl. oz.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix the Glycerin with 200 C.c. [old form 9½ fl. oz.] of Alcohol and 500 C.c. [old form 24 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 19 fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and afterwards a mixture of Alcohol and Water, made in the proportion of 200 C.c. [old form 10 fl. oz.] of Alcohol to 500 C.c. [old form 24 fl. oz.] of Water, until the Uva Ursi is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough of the mixture of Alcohol and Water to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM VALERIANÆ FLUIDUM. U.S. Fluid Extract of Valerian.

	Metric.	Old form.
Valerian, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Valerian is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM VERATRI VIRIDIS FLUIDUM. U. S. Fluid Extract of Veratrum Viride.

	Metric.	Old form.
Veratrum Viride, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 300 C.c. [old form 14½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Veratrum Viride is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM VIBURNI OPULI FLUIDUM. U. S. Fluid Extract of Viburnum Opulus.

	Metric.	Old form.
Viburnum Opulus, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 14½ fl. oz.] of the mixture, pack it moderately in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Viburnum Opulus is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM VIBURNI PRUNIFOLII FLUIDUM. U. S. Fluid Extract of Viburnum Prunifolium.

	Metric.	Old form.
Viburnum Prunifolium, in No. 60 powder	1000 Gm.	50 oz. av.
Alcohol,		
Water, each, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Mix 750 C.c. [old form 36 fl. oz.] of Alcohol with 250 C.c. [old form 12 fl. oz.] of Water, and, having moistened the powder with 300

C.c. [old form 14½ fl. oz.] of the mixture, pack it moderately in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the *Viburnum Prunifolium* is exhausted. Reserve the first 850 C.c. [old form 41 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough menstruum to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM XANTHOXYLI FLUIDUM. U. S. Fluid Extract of Xanthoxylum.

	Metric.	Old form.
Xanthoxylum, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 250 C.c. [old form 12 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Xanthoxylum is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

EXTRACTUM ZINGIBERIS FLUIDUM. U. S. Fluid Extract of Ginger.

	Metric.	Old form.
Ginger, in No. 40 powder	1000 Gm.	50 oz. av.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	8 pints.

Moisten the powder with 250 C.c. [old form 12 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Ginger is exhausted. Reserve the first 900 C.c. [old form 43 fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to a soft extract; dissolve this in the reserved portion, and add enough Alcohol to make the Fluid Extract measure 1000 C.c. [old form 3 pints].

QUESTIONS ON CHAPTER XXVII.

ALCOHOLIC LIQUIDS MADE BY PERCOLATION OR
MACERATION.

- What are tinctures? How many are official?
 Wherein do they differ from spirits?
 What exception is there to this rule?
 By what different methods are tinctures made?
 What menstrua are used in making tinctures?
 What are the advantages, and what the disadvantages, of using alcohol as a menstruum?
 Where the alcohol is objectionable, what other preparation may be substituted for a tincture?
 Which will extract a larger amount of the soluble principles of a drug, a pint of diluted alcohol or half a pint of alcohol and half a pint of water, used separately?
 Name some of the principal substances that are soluble in alcohol.
 What substances are soluble in diluted alcohol?
 For what purpose is glycerin used in tinctures?
 In what different ways are official tinctures made?
 Which is the best method for making tinctures?
 What are the special advantages of percolation?
 Which will be found more convenient in practice, the use of measures or the use of parts by weight in making tinctures?
 How many official tinctures are made by percolation?
 In what cases is the process of maceration preferably used?
 What tincture is made by simple solution?
 What official tincture is made by dilution?
 Give the formula and mode of making tincture of aconite.
 What part of the plant is meant by aconite?
 What fineness of powder is used in this formula?
 Give the official name, formula, and mode of making tincture of aloes. Tincture of aloes and myrrh. Tincture of arnica flowers.
 The name of this preparation in the U. S. P. of 1870 was tincture of arnica. Why was it changed?
 Give the official name, formula, and mode of making tincture of arnica root. Tincture of asafetida. Tincture of bitter orange peel. Tincture of sweet orange peel. Tincture of belladonna leaves. What was the name of this preparation in the Pharmacopoeia of 1880? Tincture of benzoin. Compound tincture of benzoin. Tincture of bryonia. Tincture of calendula. Tincture of calumba. Tincture of Indian cannabis. Tincture of cantharides. Tincture of capsicum. Tincture of cardamom. Compound tincture of cardamom. Compound tincture of catechu. Tincture of chirata. Tincture of cimicifuga. Tincture of cinchona.
 What kind of cinchona is used in this tincture?
 Give the formula and mode of making compound tincture of cinchona.
 What kind of cinchona is used in this tincture?
 What degree of fineness is directed for the powder?
 Give the formula and mode of making tincture of cinnamon. Tincture of colchicum seed. What was the name of this preparation in the U. S. P. of 1880? Tincture of saffron. Tincture of cubeb. Tincture of digitalis.
 How should tinctures of fresh herbs be made when no special direction has been given?
 Give the formula for tincture of ferric chloride.
 What salt of iron does it contain?
 Describe its appearance and properties.
 What is its specific gravity?
 Give the formula and mode of making tincture of nutgall. Tincture of gelsemium. Compound tincture of gentian.
 What degree of fineness is directed for the powder?
 Give the formula and mode of making tincture of guaiac. Ammoniated tincture of guaiac. What degree of fineness is directed for the powder in these last two tinctures? Tincture of hops. Tincture of hydrastis. Tincture of hyoscyamus.
 Give the formula and mode of making tincture of iodine.

- How does the present name (Latin) differ from that of the U. S. P. 1870?
- Give the formula for making tincture of ipecac and opium.
- Give the formula and mode of making tincture of kino. Tincture of krameria.
- Tincture of lactucarium. Compound tincture of lavender.
- What degree of fineness is directed for the powder?
- Give the formula and mode of making tincture of lobelia.
- What part of the plant is meant by lobelia?
- Give the formula and mode of making tincture of matico. Tincture of musk.
- Tincture of myrrh. Tincture of nux vomica.
- How much dry extract of nux vomica does each 100 parts of tincture contain?
- What percentage of alkaloids should extract of nux vomica contain?
- What quantity of alkaloids should be contained in 100 C.c. of the tincture?
- How is tincture of opium made?
- How much opium is there in each 100 parts of tincture?
- About how much is there in a teaspoonful of tincture?
- Give the formula and mode of making camphorated tincture of opium.
- How much opium is there in each 100 parts of this tincture?
- How is deodorized tincture of opium made?
- How much opium is there in each 100 parts of tincture?
- Give the formula and mode of making tincture of physostigma. Tincture of pyrethrum. Tincture of quassia. Tincture of quillaja. Tincture of rhubarb. Aromatic tincture of rhubarb. Sweet tincture of rhubarb. Tincture of sanguinaria. Tincture of squill. Tincture of serpentaria. Tincture of stramonium seed. Tincture of sumbul. Tincture of tolu. Tincture of valerian. Ammoniated tincture of valerian. Tincture of vanilla. Tincture of veratrum viride. Tincture of ginger.
- What are medicated wines?
- Which are preferable preparations, wines or tinctures? and why?
- How many official wines are there?
- In how many different ways are official wines prepared?
- Which are not medicated?
- How many are made by solution? Name them.
- Name those made by maceration. By percolation.
- How are they made?
- What is white wine?
- What percentage of alcohol should it contain?
- What is red wine? How much alcohol should it contain?
- What wine is used in making the official wines?
- Give the formula and mode of making wine of antimony.
- What percentage of tartrate does it contain?
- About how much in a teaspoonful?
- Give the formula and mode of making wine of colchicum root. Wine of colchicum seed. Wine of ergot. Bitter wine of iron. Wine of citrate of iron. Wine of ipecac. Wine of opium.
- How much opium is there in 100 parts of the wine?
- Give the formula and mode of making wine of rhubarb.
- What are fluid extracts?
- When were they made official in the U. S. P. for the first time?
- How many are there in the present Pharmacopoeia?
- What are the special advantages of fluid extracts?
- How is permanency secured?
- What is the advantage of concentration?
- Are the fluid extracts of the present Pharmacopoeia of the same strength as those of the U. S. P. 1870?
- What difference is there between them?
- Are they different from those of the U. S. P. 1880?
- Upon what is the present system arranged?
- In what different methods are fluid extracts made?
- What is the official process?
- Give a typical formula for preparing a fluid extract.
- Explain the process of percolation with incomplete exhaustion in making fluid extracts.
- What is the principal disadvantage of this process, and why is the official process better?
- Give a description of the process of repercolation. Of repercolation with hydraulic pressure. Of vacuum maceration and percolation.

How may fluid extracts be best preserved?

Into how many classes are fluid extracts divided?

How many have for a menstruum alcohol? Name them. Why is alcohol used for these in preference to other menstrua?

How many have for a menstruum 4 parts alcohol, 1 part water?

How many have for a menstruum 3 parts alcohol, 1 part water? Name them.

How many have acetic acid in addition to this menstruum? Name them. What fluid extract has ammonia, how much ammonia is used, and why is ammonia used?

How many have for a menstruum 2 parts alcohol, 1 part water? Name them. How many have glycerin in addition to this menstruum, and how much glycerin is used? Name them.

How many have for a menstruum diluted alcohol? Name them.

How many have glycerin in addition to this menstruum? Name them. How much glycerin have they? Have they all the same amount of glycerin? How many have a menstruum of diluted alcohol together with acetic acid? How much acetic acid is used, and for what purpose?

How many have for a menstruum 1 part alcohol, 2 parts water? Name them. Which one has this same menstruum with the addition of glycerin?

Give the menstrua for the following fluid extracts: apocynum, bitter orange peel, cinchona, frangula, glycyrrhiza, gossypium, hamamelis, pareira, uva ursi, wild cherry.

What two have for a menstruum boiling water?

Which official fluid extract is made with ammonia water in the menstruum?

What is the object of using ammonia water?

CHAPTER XXVIII.

ETHEREAL LIQUIDS MADE BY PERCOLATION.

Oleoresinæ. *Oleoresina.*

THE oleoresins are official liquid preparations, consisting principally of natural oils and resins extracted from vegetable substances by percolation with ethylic ether. The oleoresins were formerly classed with fluid extracts, but they differ essentially from the latter: 1. They do not bear any uniform relation to the drug, as the fluid extracts do, of gramme to cubic centimetre,—the yield of oleoresin obtained from the drug varying according to the proportion of oil and resin naturally present. 2. The menstruum used, ethylic ether, extracts principles which are often insoluble in alcohol or in diluted alcohol, and *vice versa*. Oleoresin of cubeb, for instance, is not identical in properties with fluid extract of cubeb. 3. They are without exception the most concentrated liquid preparations of the drugs that are produced.

Oleoresins are prepared by percolating the powdered drug, contained in a cylindrical percolator provided with a cover and receptacle suitable for volatile liquids, with ethylic ether, until exhausted, recovering the greater part of the ether by distillation, and exposing the residue in a capsule to spontaneous evaporation until the remaining ether has evaporated. Fig. 347 shows a convenient percolator for making oleoresins. The powder should not be packed too tightly in the narrow percolator: the exit-tube affords a means of easily regulating the flow. A *continuous extraction apparatus* can be made of this percolator by enclosing the upper part in a suitable case and passing cold water between, arranging the apparatus like a Liebig's condenser (see page 157). A glass tube is connected with the top of the percolator and the mouth of the bottle by rubber-tube connections, and if the receiving-bottle is placed in a water-bath and the water gently heated, the ether will evaporate from the percolate, the vapors rising in the tube and condensing in the upper part of the percolator.

Oleoresins which have not been evaporated sufficiently are frequently found in commerce: they have a decided odor of ether, and sometimes of benzine, showing in the latter case that a menstruum which is a much inferior solvent has been substituted for the one authorized by the Pharmacopœia. Six oleoresins are official.

FIG. 347.

Percolator for volatile liquids.

Table of Official Oleoresins.

Name.	Yield.	Dose.
Oleoresina Aspidii.	10 to 15 per cent.	f _{3s} to f _{3i} .
“ Capeici.	5 per cent.	m ₄ to m _i .
“ Cubebæ.	18 to 25 per cent.	m _v to m _{xxx} .
“ Lupulini.	50 per cent.	m _{ij} to m _v .
“ Piperis.	5 per cent.	m ₄ to m _i .
“ Zingiberis.	6 to 8 per cent.	m _i .

OLEORESINA ASPIDIUM. U. S. Oleoresin of Aspidium.

	Metric.	Old form.
Aspidium, recently reduced to No. 60 powder	500 Gm.	16 oz. av.
Ether, a sufficient quantity.		

Put the Aspidium into a cylindrical glass percolator, provided with a stop-cock, and arranged with cover and receptacle suitable for volatile liquids. Press the drug firmly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath, and, having transferred the residue to a capsule, allow the remaining Ether to evaporate spontaneously. (The product is usually about 60 Gm.) [old form 2 fl. oz.].

Keep the oleoresin in a well-stoppered bottle.

NOTE.—Oleoresin of Aspidium usually deposits, on standing, a granular-crystalline substance (filicic acid). This should be thoroughly mixed with the liquid portion before use.

OLEORESINA CAPSICI. U. S. Oleoresin of Capsicum.

	Metric.	Old form.
Capsicum, in No. 60 powder	500 Gm.	82 oz. av.
Ether, a sufficient quantity.		

Put the Capsicum into a cylindrical glass percolator, provided with a stop-cock, and arranged with cover and receptacle suitable for volatile liquids. Press the drug firmly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath, and, having transferred the residue to a capsule, allow the remaining Ether to evaporate spontaneously. Then pour off the liquid portion, transfer the remainder to a strainer, and, when the separated fatty matter (which is to be rejected) has been completely drained, mix the liquid portions together. (The product is usually about 25 Gm.) [old form 1½ fl. oz.].

Keep the Oleoresin in a well-stoppered bottle.

OLEORESINA CUBEBÆ. U. S. Oleoresin of Cubeb.

	Metric.	Old form.
Cubeb, in No. 80 powder	500 Gm.	16 oz. av.
Ether, a sufficient quantity.		

Put the Cubeb into a cylindrical glass percolator, provided with a stop-cock, and arranged with cover and receptacle suitable for volatile liquids. Press the drug firmly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath,

and, having transferred the residue to a capsule, allow the remaining Ether to evaporate spontaneously. (The product is usually about 125 Gm.) [old form 4 fl. oz.].

Keep the product in a well-stoppered bottle.

NOTE.—Oleoresin of Cubeb deposits, after standing for some time, a waxy and crystalline matter (Cubebin), which should be rejected, only the liquid portion being used.

OLEORESINA LUPULINI. U.S. Oleoresin of Lupulin.

	Metric.	Old form.
Lupulin	100 Gm.	16 oz. av.
Ether, a sufficient quantity.		

Put the Lupulin into a cylindrical glass percolator, provided with a stop-cock, and arranged with cover and receptacle suitable for volatile liquids. Press the drug very lightly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath, and, having transferred the residue to a capsule, allow the remaining Ether to evaporate spontaneously. (The product is usually about 50 Gm.) [old form 8 fl. oz.].

Keep the Oleoresin in a well-stoppered bottle.

OLEORESINA PIPERIS. U.S. Oleoresin of Pepper.

	Metric.	Old form.
Pepper, in No. 60 powder	500 Gm.	82 oz. av.
Ether, a sufficient quantity.		

Put the Pepper into a cylindrical glass percolator, provided with a stop-cock, and arranged with a cover and receptacle for volatile liquids. Press the drug firmly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath, and, having transferred the residue to a capsule, set this aside until the remaining Ether has evaporated, and the deposition of crystals of piperin has ceased. Lastly, separate the Oleoresin from the piperin by expression through a muslin strainer. (The product is usually about 25 Gm.) [old form 1½ fl. oz.].

Keep the Oleoresin in a well-stoppered bottle.

OLEORESINA ZINGIBERIS. U.S. Oleoresin of Ginger.

	Metric.	Old form.
Ginger, in No. 60 powder	500 Gm.	16 oz. av.
Ether, a sufficient quantity.		

Put the Ginger into a cylindrical glass percolator, provided with a stop-cock, and arranged with cover and receptacle suitable for volatile liquids. Press the drug firmly, and percolate slowly with Ether, added in successive portions, until the drug is exhausted. Recover the greater part of the Ether from the percolate by distillation on a water-bath, and, having transferred the residue to a capsule, allow the remaining Ether to evaporate spontaneously. (The product is usually about 30 Gm.) [old form 1 fl. oz.].

Keep the Oleoresin in a well-stoppered bottle.

CHAPTER XXIX.

ACETOUS LIQUIDS MADE BY PERCOLATION.

Aceta. Vinegars.

THIS class of preparations is an old one, having been in use since the days of Hippocrates. Medicated vinegars are solutions of the active principles of drugs in diluted acetic acid, the latter being chosen as a menstruum because acetic acid is not only a good solvent but also possesses antiseptic properties.

Diluted acetic acid replaces the menstrea formerly used, wine and cider vinegar having been discarded on account of their variable quality. Acetic acid may be obtained in all parts of the country very cheaply and of unexceptionable quality, and by simple admixture with about five times its weight of water the menstruum is produced. The properties of acetic acid are noticed in Part IV. of this work.

Two vinegars are official at present: one is made from a drug which owes its activity to alkaloids. The advantage of using acidulous menstruum is apparent in forming soluble salts with the alkaloids, and experience has proved the value of diluted acetic acid as a solvent in exhausting drugs of this character. The medicated vinegars should not be made in larger quantities than can be used within a reasonable time, for, although possessed of most of the characters of permanent preparations, they are liable to deposit in time.

The official vinegars are now uniform in strength, each containing the soluble principles from ten per cent. of drug. They are both made by percolation.

Table of Official Vinegars.

Name.	Proportions.
Acetum Opii	100 Gm. Powdered Opium; 80 Gm. Powdered Nutmeg; 200 Gm. Sugar, with sufficient Diluted Acetic Acid to make 1000 C.c.
“ Scillæ	100 Gm. Squill, No. 80 powder, with sufficient Diluted Acetic Acid to make 1000 C.c.

ACETUM OPII. U.S. Vinegar of Opium.

	Metric.	Old form.
Powdered Opium	100 Gm.	365 grains.
Nutmeg, in No. 80 powder	30 Gm.	109 grains.
Sugar	200 Gm.	780 grains.
Diluted Acetic Acid, a sufficient quantity,		
To make	1000 C.c.	½ pint.

Macerate the Opium and Nutmeg in 500 C.c. [old form 4 fl. oz.] of Diluted Acetic Acid during seven days, frequently stirring; then

strain through muslin of close texture, and express the liquid. Mix the residue with 200 C.c. [old form 1½ fl. oz.] of Diluted Acetic Acid to a uniform magma, and strain and express again. Mix and filter the strained liquids, dissolve the Sugar in the filtrate, and pass enough Diluted Acetic Acid through the filter to make the product measure 1000 C.c. [old form 8 fl. oz.].

To assay this preparation, transfer 100 C.c. of it to a small capsule, add 4 Gm. of precipitated calcium carbonate, or such a quantity as will be sufficient to neutralize the free acid, and then proceed further as directed under *Tinctura Opii*.

ACETUM SCILLÆ. U. S. Vinegar of Squill.

	Metric.	Old form.
Squill, in No. 80 powder	100 Gm.	3 oz. av. 148 gr.
Diluted Acetic Acid, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Macerate the Squill with 900 C.c. [old form 29 fl. oz.] of Diluted Acetic Acid during seven days, frequently stirring; then strain through muslin, and wash the mass on the strainer with enough Diluted Acetic Acid, until the strained liquid measures 1000 C.c. [old form 2 pints]. Finally filter.

QUESTIONS ON CHAPTERS XXVIII. AND XXIX.

ETHEREAL AND ACETOUS LIQUIDS MADE BY PERCOLATION.

What are oleoresins?

In what respects do they differ from fluid extracts?

How are they prepared?

How many oleoresins are official? Name them.

Give the official name, menstruum, and mode of preparing oleoresin of aspidium.

Should the deposit which usually occurs in this oleoresin upon standing be filtered out?

Give the Latin name, menstruum, and mode of preparing oleoresin of capsicum. Oleoresin of cubeb.

Should the waxy and crystalline matter which is deposited from oleoresin of cubeb be separated from the oleoresin?

Give the Latin name, menstruum, and mode of preparing oleoresin of lupulin. Oleoresin of pepper.

Should the latter oleoresin be separated from the piperin which is deposited?

Give the Latin name, menstruum, and mode of preparing oleoresin of ginger.

What are medicated vinegars?

Why was vinegar chosen as a menstruum, and why is acetic acid used in place of vinegar?

How many vinegars are official? Name them.

What is their percentage strength?

How are they made?

Give the Latin name and menstruum of vinegar of opium. Vinegar of squill.

What are the ingredients of acetum opii, and in what condition of fineness are they directed?

CHAPTER XXX.

SOLID PREPARATIONS MADE BY PERCOLATION.

Extracta. Extracts.

EXTRACTS are solid or semi-solid preparations produced by evaporating solutions of vegetable principles. The solutions may be made by percolating the drug with water, alcohol, diluted alcohol of various strengths, ether, diluted acetic acid, or diluted solution of ammonia, and the extracts made from such percolates are termed respectively *aqueous, alcoholic, hydro-alcoholic, ethereal, acetic, or ammoniated extracts*. In addition to this, the juices of fresh plants extracted by contusion and expression are evaporated, and such extracts are frequently called *Succi Spissati, or inspissated juices*.

Preparation of Inspissated Juices.—The variation in the amount of extractive matter afforded by expressing fresh plants is so great that the quality of this class of extracts is necessarily very uncertain. Although alcoholic extracts are also subject to variations, experience has shown that they are much more reliable, when properly made, than extracts prepared from expressed juices. For this reason inspissated juices, with one exception, were not recognized in the U.S. Pharmacopoeia of 1890. Extract of taraxacum, the sole representative of the class remaining, is at best a feeble preparation, and is fast passing out of use as an active remedy. The inspissated juices most largely consumed in America are made in Great Britain, and the general formula of the British Pharmacopoeia is appended :

Bruise the fresh plant in a stone mortar, and press out the juice ; heat it gradually to 130° F., and separate the green colouring matter by a calico filter. Heat the strained liquid to 200° F. to coagulate the albumen, and filter again. Evaporate the filtrate by a water-bath to the consistence of a thin syrup ; then add to it the green colouring matter previously separated, and, stirring the whole assiduously, continue the evaporation at a temperature not exceeding 140° F., until the extract is of a suitable consistence for forming pills.

Prof. Herrera has proposed a plan of making extracts without the use of much heat,—*by freezing the juices*. He finds that by compressing the frozen juice the expressed liquid, or mother-liquor, is greatly strengthened, the water being largely removed as ice, which remains in the press-cloth, and the concentrated juice is then dried by exposure on plates to the sun.

The percolates, or expressed juices of drugs, contain, in addition to the active principles, certain inert substances, which exist in the liquids in varying quantities. The amount of inert matter found in the extract

depends largely upon the manipulation, but the composition of extracts also varies with the nature of the drug, the character of the solvent, and the mode of preparation. The object is generally to obtain as much of the active principle of the plant, with as little of the inert matter, as possible; though sometimes it may be desirable to separate two active ingredients from each other, when their effects upon the system are materially different: this may be partially accomplished by employing a menstruum which, while it dissolves one, leaves the other untouched. The proximate principles most commonly present in extracts are *gum, sugar, starch, tannin, extractive, chlorophyl, coloring-matter, salts*, and the *peculiar principles of plants*; to which, when a spirituous solvent is employed, may usually be added *resinous substances, fatty matter*, and frequently more or less *volatile oil*; gum and starch being excluded when the menstruum is pure alcohol.

Extractive.—It has long been known that in most vegetable bodies there is a substance, soluble both in water and in alcohol, which, in the preparation of extracts, undergoes chemical change during the process of evaporation, imparting to the liquid, even if originally limpid, first a greenish, then a yellowish-brown, and ultimately a deep brown color, and becoming itself insoluble. This substance has received the appropriate name of *extractive*, derived from its frequent presence in extracts. Its existence as a distinct principle is denied, or at least doubted, by some chemists, who consider the phenomena supposed to result from its presence as depending upon the mutual reaction of other principles. The most important property of extractive is its disposition to pass, by the influence of atmospheric air at a high temperature, into an insoluble substance. If a vegetable infusion or decoction be evaporated in the open air to the consistence of an extract, then diluted, filtered, and again evaporated, and the process repeated so long as any insoluble matter is formed, the whole of the extractive will be separated from the liquid, while the other ingredients may remain. If chlorine be passed through an infusion or decoction, a similar precipitate is formed with much greater rapidity. The change is usually ascribed to the absorption of oxygen by the extractive, which has, therefore, been called, in its altered condition, oxidized extractive; but De Saussure ascertained that, though oxygen is absorbed during the process, an equal measure of carbonic acid gas is given out, and the oxygen and hydrogen of the extractive unite to form water in such a manner as to leave the principle richer in carbon than it was originally. The name of oxidized extractive is, therefore, obviously incorrect; and Berzelius long ago proposed to substitute for it that of *apotheme*, synonymous with deposit. According to Berzelius, apotheme is not completely insoluble in water, but imparts a slight color to that liquid when cold, and is rather more soluble in boiling water, which becomes turbid upon cooling. It is still more soluble in alcohol, and is freely dissolved by solutions of the alkalies and alkaline carbonates, from which it is precipitated by acids. It has a great tendency, when precipitated from solutions, to unite with other principles and to carry them along with it, thus acquiring properties somewhat different according to the source from which it is obtained. In this way, also, even when the extractive of a plant is itself medicinally

inert, its conversion into apotheme may be injurious by causing a precipitation of a portion of the active principle; and in practical pharmaceutical operations this change should always, if possible, be avoided.

Variable Quality of Extracts.—*It is evident that there must be great variation in the quality of these preparations as found in commerce*, for, whether made by any of the processes commonly employed, or by a special patented process, the lack of a fixed standard to determine the amount of moisture which is to remain in the extracts renders them very variable in strength. The Pharmacopœia is necessarily compelled to avoid specifying an exact limit in this respect, and the approximate standard of "*pilular consistence*" has been adopted. The preparations considered in another place, called *abstracts*, have a great advantage over extracts in this respect. It should be said in addition that the variation in the strength of extracts of pilular consistence does not cease even after their manufacture. The exposure to the air which they are subject to in dispensing, particularly if kept in the customary open queen's-ware jars, causes loss of moisture, and they become hard, and consequently stronger, in proportion to the quantity of moisture that is thus lost: this loss may in some cases amount to as much as twenty-five per cent. In moist climates, however, some extracts absorb moisture and become thinner. The greatest variation in the commercial extracts, however, arises from the difference in the alcoholic strength of the menstruum employed. This may be best illustrated by taking the case of extract of jalap. Alcohol always dissolves the active principles, whilst water is the best solvent for those that are inert. If a manufacturer in making extract of jalap uses equal parts of alcohol and water, he will obtain twice as much extract as the manufacturer who simply uses alcohol; but the alcoholic extract or resin has twice the strength of the hydro-alcoholic extract, and is worth double the price, because it has been shown by actual experiment that the aqueous extract of jalap is absolutely inert even in doses of two hundred and forty grains. The difference between the relative merits of alcoholic and aqueous extracts does not so clearly appear in many of the extracts as in the instance just noted, but it is shown in such important extracts as those from belladonna, hyoscyamus, digitalis, etc., for here the strength depends largely upon the menstrua used in exhausting them, water removing the inert principles, starch, gum, albumen, sugar, salt, etc. The relative value of commercial extracts must depend upon the amount of *active* principles present; and as the manufacturer never states upon the label the menstruum that he has employed in making the extract, nor the yield of the extract from the drug from which it was prepared, and as each manufacturer uses the menstruum that he thinks best, the pharmacist and physician have no means of knowing the dose of the extract, nor can they usually form any correct judgment of its value without a therapeutical experiment or analytical assay. It will be seen, therefore, from the foregoing considerations that extracts are among the most *unreliable* of all classes of preparations. It is greatly to be regretted that manufacturers do not *strictly adhere* to the menstrua directed in the Pharmacopœia, for the sake of securing uniformity, if for no other reason.

Preparation of Extracts.—The manipulations necessary to produce

extracts have all been treated of under the various heads of Maceration, Expression, Percolation, Decoction, Infusion, Evaporation, Use of Steam Heat, Vacuum Apparatus, etc. The special precautions necessary for each extract will be noticed in the official working formulas which follow. The details of the formulas vary so much that a general formula is of little value, except to serve as a type for the alcoholic extracts, which resemble one another more closely than any of the others do.

Preservation of Extracts.—The general practice is to take no especial care in the preservation of extracts. This arises from the incorrect impression that they are permanent preparations and do not need it. The manufacturers seal the jars or bottles which contain them, because experience has compelled them to be very careful about this, to avoid loss in transportation,—in the case of soft extracts, through inversion of the jar. The loosely-fitting covers to the jars permit the exposure which causes the variation above noticed, and it is impracticable for the pharmacist on every occasion to seal the jar immediately after he has used a portion of the extract. Several expedients have been suggested to overcome these difficulties. It is a good practice to enclose the jar in a tightly-fitting tin can, or to put the extract in a jar with a screw-cap cover which has a thin cork disk in the top to aid in making a tight joint.

General Formula for Alcoholic Extracts.—Percolate the powdered drug with the menstruum directed, until it is exhausted; reserve the first third of the percolate, evaporate the remainder at a temperature not exceeding 50° C. (122° F.) until it weighs ten per cent. of the weight of the drug. Mix this with the reserved portion, and evaporate both at the above temperature to a pilular consistence. Or, instead of reserving a part of the percolate, the whole quantity is distilled until the alcohol is recovered, and the residue is evaporated to a pilular consistence. In the case of those extracts which are apt to become hard, five per cent. of glycerin may be added to enable them to retain their consistence.

Official Extracts.—The official extracts are *thirty-three* in number. Of these, *twenty-three* are directed to be made with alcoholic menstrua of various strengths,—viz., Extracts of Aconite, Jalap, Physostigma, Cannabis Indica, Cimicifuga, Iris, Podophyllum, Rhubarb, Cinchona, Leptandra, Nux Vomica, Belladonna Leaves, Hyoscyamus, Digitalis, Euonymus, Arnica Root, Conium, Juglans, Stramonium (seed), Colocynth, Ergot, Uva Ursi, Compound Colocynth.

Ten official extracts are made with an aqueous menstruum,—viz., Extract of Aloes, Hæmatoxylon, Opium, Taraxacum, Gentian, Pure Extract of Glycyrrhiza, Krameria, Quassia, Colchicum Root, Glycyrrhiza. Of these,

One extract is percolated with water containing five per cent. of ammonia water,—i.e., Pure Extract of Glycyrrhiza.

One extract is made with a menstruum composed of water containing 23.3 per cent. of official acetic acid,—i.e., Extract of Colchicum Root.

One extract is made by evaporating a fluid extract,—i.e., Extract of Ergot. One extract is made by mixing extracts with aromatics, etc.,—i.e., Compound Extract of Colocynth.

One extract is an inspissated juice,—i.e., Extract of Taraxacum.

Table of Official Extracts arranged according to the Alcoholic Strength of their Menstrua.

NAME AND MEN- STRUUM.	Fineness of Powder.	Quantity to macerate 1000 Gm. of Drug.	Per cent. reserved.	Process and Notes.
Alcohol.		C.c.		
Extractum Aconiti.	60	400	90	Percolating after 48 hours' maceration, reserving 90 per cent. of percolate, evaporating the remainder to 10 per cent., adding the reserved portion, and evaporating at a temperature not above 50° C. (122° F.) to a pilular consistence.
Jalapæ.	60	850	90	" " " "
Physostigmati.	80	400	90	" " " "
Cannabis Indicæ.	20	800		Percolating to exhaustion after 48 hours' maceration, distilling off alcohol, and evaporating to a pilular consistence.
Cimicifugæ.	60	250		" " " "
Iridis.	60	400		" " " "
Alcohol 4, Water 1.				
Extractum Podophylli.	60	800		" " " "
Rhei.	80	400	100	Percolating to exhaustion after maceration, reserving the first 1000 C.c. of percolate from 1000 Gm. of drug, and spontaneously evaporating this reserved portion to one-half its weight, evaporating the remainder to the consistence of syrup, mixing with reserved portion, and evaporating to a pilular consistence.
Alcohol 3, Water 1.				
Extractum Cinchonæ.	60	850		Percolating to exhaustion after 48 hours' maceration, using diluted alcohol to finish, distilling off alcohol, and evaporating to a pilular consistence.
Leptandree.	40	400		Percolating to exhaustion after 48 hours' maceration, distilling off alcohol, and evaporating to a pilular consistence.
Nucis Vomiceæ.	60	1000		Percolating to exhaustion after digestion for 48 hours (5 per cent. acetic acid in menstruum), evaporating to a thick liquid, assaying, and adding sugar of milk till brought to the strength of "15 per cent. of alkaloids."
Alcohol 2, Water 1.				
Extractum Belladonnæ Alcohol-icum (leaves).	60	400	90	Percolating to exhaustion after 48 hours' maceration, using diluted alcohol to finish, reserving 90 per cent. of percolate, evaporating the remainder to 10 per cent., mixing with reserved portion, and evaporating at a temperature not above 50° C. (122° F.) to a pilular consistence.
Hyoscyami.	60	400	90	" " " "

Official Extracts.—(Continued.)

NAME AND MEN- STRUUM.	Fineness of Powder.	Quantity to moisten 1000 Gm. of Drug.	Per cent. reserved.	Process and Notes.
Alcohol 2, Water 1. Extractum Digitalis.	60	C.c. 400		Percolating to exhaustion after 48 hours' maceration, using diluted alcohol to finish, distilling off alcohol, and evaporating at a temperature not exceeding 50° C. (122° F.) to a pilular consistence.
Euonymi.	80	400		“ “ “ “
Diluted Alcohol. Extractum Arnice Radicis.	60	400	90	Percolating to exhaustion after 24 hours' maceration, reserving 90 per cent. of percolate, evaporating the remainder to 10 per cent., mixing with reserved portion, and evaporating at a temperature not above 50° C. (122° F.) to a pilular consistence.
Conii.	40	800	90	Same process as for Arnica Root, except the time of maceration, which is 48 hours, and with the addition of 2 per cent. of acetic acid to the diluted alcohol.
Juglandis.	80	400		Percolating to exhaustion after 48 hours' maceration, distilling off alcohol, and evaporating to a pilular consistence.
Stramonii Seminis.	60	800	90	Percolating to exhaustion after 48 hours' maceration, reserving 90 per cent. of percolate, evaporating the remainder to 10 per cent., mixing with reserved portion, and evaporating at a temperature not above 50° C. (122° F.) to a pilular consistence.
Colocynthis (freed from seeds).	Coarse powder.			Macerating for 4 days, expressing and straining tincture through flannel, percolating residue, distilling the mixed tinctures to recover the alcohol, evaporating residue to dryness, and making into a powdered extract.
Ergotæ.				Made by evaporating Fluid Extract of Ergot at a temperature not exceeding 50° C. (122° F.) to a pilular consistence.
Alcohol 2, Water 3. Extractum Uvae Ursi.	80	400	90	Percolating to exhaustion after 48 hours' maceration, reserving 90 per cent. of the percolate, evaporating the remainder to 10 per cent., mixing, and evaporating to a pilular consistence.
Water. Extractum Aloes.				<div> <div>Maceration.</div> <div> <p>Macerating in boiling water, with stirring, letting the mixture stand for 12 hours, decanting the liquid, and evaporating to dryness.</p> <p>Macerating with cold water for 48 hours, then boiling (avoiding the use of metallic vessels) until one-half the water has evaporated, straining the decoction while hot, and evaporating to dryness.</p> </div> </div>
Hamatoxyli.				

Official Extracts.—(Continued.)

NAME AND MEN- STRAUM.	Fineness of Powder.	Quantity to make 1000 Gm. of Drug.	Per cent. reserved.	Process and Notes.
Water. Extractum Opii.		C.c.		<div><div>Maceration.</div><div><p><i>Macerating</i> repeatedly in cold water, filtering, evaporating the mixed filtered liquids, assaying, and adding sufficient sugar of milk to make the dry powdered extract contain 18 per cent. of morphine.</p></div></div>
Taraxaci. Gentianæ.	20	400		Inspissated juice from the fresh plant. Percolating to exhaustion after 24 hours' maceration, boiling the percolate until reduced to three-fourths of its weight, straining, and evaporating to a pilular consistence.
Glycyrrhizæ Purum.	20	1000		Percolating to exhaustion after 24 hours' maceration with water containing 5 per cent. of <i>Ammonia Water</i> to dissolve the Glycyrrhizin, and evaporating to a pilular consistence.
Krameria.	40	800		Percolating to exhaustion, heating the liquid to the boiling point, straining, and evaporating at a temperature not above 70° C. (158° F.) to dryness.
Quassia.	20	400		Percolating to exhaustion, reducing the liquid to three-fourths of its weight by boiling, straining, and evaporating to a pilular consistence.
Colchici Radi- cis.	60	500		Percolating to exhaustion after macerating with water containing 23.3 per cent. of <i>Official Acetic Acid</i> , and evaporating the percolate at a temperature not above 80° C. (176° F.) to a pilular consistence.
Glycyrrhizæ.				<i>Commercial extract</i> in rolls: not less than 60 per cent. of it should be soluble in cold water.
Colocyntidis Compositum.				Melting the Aloes by heating, adding the Alcohol, adding the Soap, Extract of Colocynt, and Resin of Scammony, heating the mixture at a temperature not exceeding 120° C. (248° F.) until homogeneous, withdrawing the heat, and adding the Cardamom; when cold, reducing the product to a fine powder.

EXTRACTUM ACONITI. U.S. Extract of Aconite.

	Metric.	Old form.
Aconite, in No. 60 powder.	1000 Gm.	32 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Aconite is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, evaporate the remainder in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.], add the reserved portion, and evaporate, at or below the above-mentioned temperature, until an extract of a pilular consistence remains.

EXTRACTUM ALOES. U.S. Extract of Aloes.

	Metric.	Old form.
Aloes	100 Gm.	32 oz. av.
Boiling Distilled Water	1000 C.c.	20 pints.

Mix the Aloes with the Water in a suitable vessel, stirring constantly, until the particles of Aloes are thoroughly disintegrated, and let the mixture stand for twelve hours; then pour off the clear liquor, strain the residue, mix the liquids, and evaporate to dryness by means of a water- or steam-bath.

EXTRACTUM ARNICÆ RADICIS. U.S. Extract of Arnica Root.

	Metric.	Old form.
Arnica Root, in No. 60 powder	1000 Gm.	32 oz. av.
Diluted Alcohol, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for twenty-four hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until the Arnica Root is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, evaporate the remainder to 100 C.c. [old form 3 fl. oz.], at a temperature not exceeding 50° C. (122° F.), mix the residue with the reserved portion, and evaporate, at or below the above-mentioned temperature, to a pilular consistence.

**EXTRACTUM BELLADONNÆ FOLIORUM ALCOHOLICUM. U.S.
Alcoholic Extract of Belladonna Leaves.**

[EXTRACTUM BELLADONNÆ ALCOHOLICUM, PHARM. 1880.]

	Metric.	Old form.
Belladonna Leaves, in No. 60 powder	1000 Gm.	32 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 2000 C.c. [old form 4 pints] of Alcohol with 1000 C.c. [old form 2 pints] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Belladonna Leaves are exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.], mix the residue with the reserved portion, and evaporate, at or below the above-mentioned temperature, to a pilular consistence.

EXTRACTUM CANNABIS INDICÆ. U.S. Extract of Indian Cannabis.

	Metric.	Old form.
Indian Cannabis, in No. 20 powder	1000 Gm.	32 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 300 C.c. [old form 9½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Cannabis is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, in a porcelain capsule, on a water-bath, to a pilular consistence.

EXTRACTUM CIMICIFUGÆ. U.S. Extract of Cimicifuga.

	Metric.	Old form.
Cimicifuga, in No. 60 powder	1000 Gm.	32 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 250 C.c. [old form 8 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Cimicifuga is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM CINCHONÆ. U.S. Extract of Cinchona.

	Metric.	Old form.
Cinchona, in No. 60 powder	1000 Gm.	32 oz. av.
Alcohol	3000 C.c.	6 pints.
Water	1000 C.c.	2 pints.
Diluted Alcohol, a sufficient quantity.		

Mix the Alcohol and Water, and, having moistened the powder with 350 C.c. [old form 11 fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then Diluted Alcohol, until 4000 C.c. [old form 8 pints] of tincture are obtained or the Cinchona is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM COLCHICI RADICIS. U.S. Extract of Colchicum Root.

	Metric.	Old form.
Colchicum Root, in No. 60 powder	1000 Gm.	82 oz. av.
Acetic Acid	350 C.c.	11 fl. oz.
Water, a sufficient quantity.		

Mix the Acetic Acid with 1500 C.c. [old form 3 pints] of Water, and, having moistened the powder with 500 C.c. [old form 1 pint] of the mixture, pack it moderately in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then Water, until the Colchicum Root is exhausted. Evaporate the percolate in a porcelain vessel, by means of a water-bath, at a temperature not exceeding 80° C. (176° F.), to a pilular consistence.

EXTRACTUM COLOCYNTHIDIS. U.S. Extract of Colocynth.

	Metric.	Old form.
Colocynth, dried, and freed from the seeds	1000 Gm.	82 oz. av.
Diluted Alcohol, a sufficient quantity.		

Reduce the Colocynth to a coarse powder by grinding or bruising, and macerate it in 3500 C.c. [old form 7 pints] of Diluted Alcohol for four days, with occasional stirring; then express strongly, and strain through flannel. Pack the residue, previously broken up with the hands, firmly in a cylindrical percolator, cover it with the strainer, and gradually pour Diluted Alcohol upon it until the tincture and expressed liquid, mixed together, measure 5000 C.c. [old form 10 pints]. Distil off the Alcohol from the mixture by means of a water-bath, evaporate the residue to dryness, and reduce the dry mass to powder.

Extract of Colocynth should be kept in well-stoppered bottles.

EXTRACTUM COLOCYNTHIDIS COMPOSITUM. U. S. Compound**Extract of Colocynth.**

	Metric.	Old form.
Extract of Colocynth	160 Gm.	16 oz. av.
Purified Aloes	500 Gm.	50 oz. av.
Cardamom, in No. 60 powder	60 Gm.	6 oz. av.
Resin of Scammony, in fine powder	140 Gm.	14 oz. av.
Soap, dried and in coarse powder	140 Gm.	14 oz. av.
Alcohol	100 C.c.	12 fl. oz.

Heat the Aloes, contained in a suitable vessel, on a water-bath, until it is completely melted; then add the Alcohol, Soap, Extract of Colocynth, and Resin of Scammony, and heat the mixture at a temperature not exceeding 120° C. (248° F.), until it is perfectly homogeneous, and a thread taken from the mass becomes brittle when cool. Then withdraw the heat, thoroughly incorporate the Cardamom with the mixture, and cover the vessel until the contents are cold. Finally, reduce the product to a fine powder.

Compound Extract of Colocynth should be kept in well-stoppered bottles.

EXTRACTUM CONII. U. S. Extract of Conium.

	Metric.	Old form.
Conium, in No. 40 powder	1000 Gm.	82 oz. av.
Acetic Acid	20 C.c.	5 fl. dr.
Diluted Alcohol, a sufficient quantity.		

Mix the Acetic Acid with 980 C.c. [old form 31½ fl. oz.] of Diluted Alcohol, and, having moistened the powder with 300 C.c. [old form 9½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or until the Conium is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, and evaporate the remainder, in a porcelain capsule, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.], mix this with the reserved portion, and evaporate, at or below the above-mentioned temperature, to a pilular consistence.

EXTRACTUM DIGITALIS. U. S. Extract of Digitalis.

	Metric.	Old form.
Digitalis, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 600 C.c. [old form 19 fl. oz.] of Alcohol with 300 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder

and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the *Digitalis* is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, at a temperature not exceeding 50° C. (122° F.), to a pilular consistence.

EXTRACTUM ERGOTÆ. U.S. Extract of Ergot.

	Metric.	Old form.
Fluid Extract of Ergot	150 C.c.	5 fl. oz.

Evaporate the Fluid Extract of Ergot in a porcelain capsule, by means of a water-bath, at a temperature not exceeding 50° C. (122° F.), constantly stirring, until it is reduced to a pilular consistence. (The yield is about 30 Gm. [old form 1 oz. av.].)

EXTRACTUM EUONYMI. U.S. Extract of Euonymus.

	Metric.	Old form.
Euonymus, in No. 30 powder	1000 Gm.	32 oz. av.

Alcohol,

Water, each, a sufficient quantity.

Mix 600 C.c. [old form 19 fl. oz.] of Alcohol with 300 C.c. [old form 9½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the *Euonymus* is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and, having placed the residue in a porcelain capsule, evaporate it, on a water-bath, to a pilular consistence.

EXTRACTUM GENTIANÆ. U.S. Extract of Gentian.

	Metric.	Old form.
Gentian, in No. 20 powder	1000 Gm.	32 oz. av.

Water, a sufficient quantity.

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Water, and let it macerate for twenty-four hours; then pack it in a conical percolator, and gradually pour Water upon it until the infusion passes but slightly imbued with the properties of the Gentian. Reduce the liquid to three-fourths of its bulk by boiling, and strain; then, by means of a water-bath, evaporate to a pilular consistence.

EXTRACTUM GLYCYRRHIZÆ. U.S. Extract of Glycyrrhiza.

[EXTRACT OF LIQUORICE.]

The commercial extract of the root of *Glycyrrhiza glabra* Linné (nat. ord. *Leguminosæ*).

In flattened, cylindrical rolls, from 15 to 18 Cm. long, and from 15 to 80 Mm. thick; of a glossy black color. It breaks with a sharp, conchoidal, shining fracture, and has a very sweet, peculiar taste. Not less than 60 per cent. of it should be soluble in cold water.

EXTRACTUM GLYCYRRHIZÆ PURUM. U.S. Pure Extract of**Glycyrrhiza.**

	Metric.	Old form.
Glycyrrhiza, in No. 20 powder	1000 Gm.	32 oz. av.
Ammonia Water	150 C.c.	4½ fl. oz.
Distilled Water, a sufficient quantity.		

Mix the Ammonia Water with 3000 C.c. [old form 6 pints] of Distilled Water, and, having moistened the powder with 1000 C.c. [old form 2 pints] of the menstruum, let it macerate for twenty-four hours. Then pack it moderately in a cylindrical glass percolator, and gradually pour upon it, first, the remainder of the menstruum, and then Distilled Water, until the Glycyrrhiza is exhausted. Lastly, evaporate the infusion, by means of a water-bath, to a pilular consistence.

EXTRACTUM HÆMATOXYLI. U.S. Extract of Hæmatoxylon.

	Metric.	Old form.
Hæmatoxylon, rasped	1000 Gm.	32 oz. av.
Water	10,000 C.c.	20 pints.

Macerate the Hæmatoxylon with the Water for forty-eight hours. Then boil (avoiding the use of metallic vessels) until one-half of the Water has evaporated; strain the decoction, while hot, and evaporate to dryness.

EXTRACTUM HYOSCYAMI. U.S. Extract of Hyoscyamus.

	Metric.	Old form.
Hyoscyamus, in No. 60 powder	1000 Gm.	32 oz. av.
Alcohol	2000 C.c.	4 pints.
Water	1000 C.c.	2 pints.
Diluted Alcohol, a sufficient quantity.		

Mix the Alcohol and Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding, first, the remainder of the menstruum, and then Diluted Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Hyoscyamus is exhausted. Reserve

the first 900 C.c. [old form 28½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.]; mix this with the reserved portion, and evaporate, at or below the before-mentioned temperature, to a pilular consistence.

EXTRACTUM IRIDIS. U.S. Extract of Iris.

	Metric.	Old form.
Iris, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Iris is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM JALAPÆ. U.S. Extract of Jalap.

	Metric.	Old form.
Jalap, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 350 C.c. [old form 11 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the Jalap is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate. Distil off the Alcohol from the remainder by means of a water-bath, evaporate the residue to 100 C.c. [old form 3 fl. oz.], add the reserved portion, and evaporate to a pilular consistence.

EXTRACTUM JUGLANDIS. U.S. Extract of Juglans.

	Metric.	Old form.
Juglans, in No. 80 powder	1000 Gm.	82 oz. av.
Diluted Alcohol, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Juglans is exhausted. Distil off the

Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM KRAMERIÆ. U.S. Extract of Krameria.

	Metric.	Old form.
Krameria, in No. 40 powder	1000 Gm.	32 oz. av.
Water, a sufficient quantity.		

Moisten the powder with 300 C.c. [old form 9½ fl. oz.] of Water, pack it in a conical glass percolator, and gradually pour Water upon it, until the infusion passes but slightly imbued with the astringency of the Krameria. Heat the liquid to the boiling point, strain, and evaporate the strained liquid, by means of a water-bath, at a temperature not exceeding 70° C. (158° F.), to dryness.

EXTRACTUM LEPTANDRÆ. U.S. Extract of Leptandra.

	Metric.	Old form.
Leptandra, in No. 40 powder	1000 Gm.	32 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 750 C.c. [old form 24 fl. oz.] of Alcohol with 250 C.c. [old form 8 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Leptandra is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM NUCIS VOMICÆ. U.S. Extract of Nux Vomica.

	Metric.	Old form.
Nux Vomica, in No. 60 powder	1000 Gm.	32 oz. av.
Acetic Acid	50 C.c.	1½ fl. oz.
Alcohol,		
Water,		
Ether,		
Sugar of Milk, recently dried and in fine powder,		
each, a sufficient quantity.		

Mix Alcohol and Water in the proportion of 750 C.c. [old form 24 fl. oz.] of Alcohol to 250 C.c. [old form 8 fl. oz.] of Water. Mix the powder with 1000 C.c. [old form 32 fl. oz.] of the mixture, to which the Acetic Acid had previously been added, and let it macerate, in a well-covered vessel, in a warm place, during forty-eight hours. Then pack it tightly in a cylindrical glass percolator, gradually pour menstruum upon it, and continue the percolation, until the Nux Vomica is practically exhausted. Distil off the Alcohol by means of a water-

bath, transfer the remainder to a tared capsule, and evaporate it until it weighs about 150 Gm. [old form 5 oz. av.]. Transfer it to a bottle of the capacity of about 500 C.c. [old form 16 fl. oz.], and wash the capsule with about 50 C.c. [old form 1½ fl. oz.] of warm Water, adding the washings to the bottle and mixing the contents thoroughly. When the liquid extract is cold, add to it one-fourth of its volume of Ether, stopper the bottle, and bring the extract and Ether into intimate contact by gently agitating and frequently inverting the bottle, avoiding violent shaking so as to prevent the formation of an emulsion. Pour off the ethereal layer as closely as possible, and repeat this treatment with Ether several times, until a few drops of the ethereal layer no longer impart a permanent, greasy stain to filtering paper. Then transfer the contents of the bottle back to the tared capsule, using a sufficient quantity of warm Water for washing. Recover the Ether from the united ethereal washings, add to the oily residue about 15 C.c. [old form 231 minims] of boiling Water, and then Acetic Acid, in drops, until the mixture has a permanent acid reaction. Then filter it through a moistened filter, and wash the filter with a little water. Add the filtrate to the extract in the capsule, evaporate until the residue weighs about 200 Gm. [old form 6½ oz. av.], and allow it to become cold. Then determine its weight exactly, remove 4 Gm. [61.72 grains] of the mass, and assay this by the process given below, using the amounts of liquids there directed for 2 Gm. [30.9 grains] of dry extract. In another portion of 5 Gm. [77.16 grains] determine the amount of water by drying it, in a flat-bottomed capsule, at 100° C. (212° F.), until it ceases to lose weight. From the results thus obtained ascertain, by calculation, the amount of total alkaloids and of water contained in the remainder of the mass, add to this enough well-dried Sugar of Milk to bring the quantity of alkaloids in the final dry extract to 15 per cent., then evaporate the mass to complete dryness, reduce it to powder, and transfer it to small, well-stoppered vials.

Extract of Nux Vomica, when assayed by the following process, should be found to contain 15 per cent. of total alkaloids.

Assay of Extract of Nux Vomica.

Extract of Nux Vomica, dried at 100° C. (212° F.), *two grammes* . . . 2 Gm.

Alcohol,

Ammonia Water,

Water,

Chloroform,

Decinormal Sulphuric Acid (V.S.),

Centinormal Potassium Hydrate V.S., each, *a sufficient quantity*.

Put 2 Gm. of the dried Extract of Nux Vomica into a glass separator, add to it 20 C.c. of a previously prepared mixture of 2 volumes of alcohol, 1 volume of ammonia water (specific gravity 0.960), and 1 volume of water, and shake the well-stoppered separator until the extract is dissolved. Then add 20 C.c. of chloroform and agitate during five minutes. Allow the chloroform to separate, remove it as far as possible, pour into the separator a few C.c. of chloroform, and, without shaking, draw this off through the stop-cock to wash the outlet-tube. Repeat the extraction with two further portions of chloroform of 15 C.c. each, and wash the outlet-tube each time as

just directed. Collect all the chloroformic solutions in a wide beaker, expose the latter to a gentle heat, on a water-bath, until the chloroform and ammonia are completely dissipated, add to the residue 10 C.c. of decinormal sulphuric acid measured with great care from a burette, stir gently, and then add 20 C.c. of hot water. When solution has taken place, add 2 C.c. of brazil wood T.S., and then carefully run in centinormal potassium hydrate V.S., until a permanent pinkish color is produced by the action of a slight excess of alkali upon the brazil wood indicator. Divide the number of C.c. of centinormal potassium V.S. used by 10, subtract the number found from 10 (the 10 C.c. of decinormal acid used), multiply the remainder by 0.0864 and that product by 50 (or, multiply at once by 1.82), which will give the percentage of *total alkaloids* in the Extract of Nux Vomica, it being assumed that strychnine and brucine are present in equal proportion, and the above factor being found by taking the mean of their respective molecular weights rounded off to whole numbers $[(334 + 394) \div 2 = 364]$.

EXTRACTUM OPII. U. S. Extract of Opium.

	Metric.	Old form.
Powdered Opium	100 Gm.	8 oz. av. 231 gr.
Sugar of Milk, recently dried and in fine powder,		
Water, each, a sufficient quantity.		

Triturate the Powdered Opium in a mortar thoroughly with 1000 C.c. [old form 2 pints] of Water, repeat the trituration occasionally, in the course of twelve hours, then filter through a rapidly-acting, double filter, and wash the filter and residue with Water, until the filtrate is nearly colorless. Concentrate the filtrate and washings in a tared capsule, on a water-bath, until the residue weighs about 200 Gm. [old form 7 oz. av.], and allow it to become cold. Then determine the weight exactly, transfer 12 Gm. [old form 185.16 gr.] of it to an Erlenmeyer flask having a capacity of about 100 C.c. [old form 3½ fl. oz.], and determine in this portion the amount of morphine by the process of assay given below, using the quantities of liquids there directed for 4 Gm. [old form 61.72 gr.] of the dry extract. In another portion of 5 Gm. [old form 77.16 gr.] determine the amount of water by drying it in a flat-bottomed capsule, at 100° C. (212° F.), until it ceases to lose weight. From the results thus obtained ascertain, by calculation, the amount of morphine and of water contained in the remainder of the extract, add to this enough well-dried Sugar of Milk to bring the quantity of morphine in the final dry extract to 18 per cent., then evaporate the whole to dryness, reduce it to powder, and transfer it to small, well-stoppered vials.

Assay of Extract of Opium.

Extract of Opium, dried at 100° C. (212° F.), four grammes	4 Gm.
Ammonia Water, two and two-tenths cubic centimeters	2.2 C.c.
Alcohol,	
Ether,	
Water, each, a sufficient quantity.	

Dissolve the Extract of Opium in 30 C.c. of water, filter the solution through a small filter, and wash the filter and residue with water, until all soluble matters are extracted, collecting the washings separately. Evaporate, in a tared capsule, first, the washings to a small volume, then add the first filtrate, and evaporate the whole to a weight of 10 Gm. Rotate the concentrated solution about in the capsule until

the rings of extract are redissolved, pour the liquid into a tared Erlenmeyer flask having a capacity of about 100 C.c., and rinse the capsule with a few drops of water at a time, until the entire solution weighs 15 Gm. Then add 7 Gm. (or 8.5 C.c.) of alcohol, shake well, add 20 C.c. of ether, and shake again. Now add the ammonia water from a graduated pipette or burette, stopper the flask with a sound cork, shake it thoroughly during ten minutes, and then set it aside, in a moderately cool place, for at least six hours, or over night.

Remove the stopper carefully, and, should any crystals adhere to it, brush them into the flask. Place in a small funnel two rapidly-acting filters, of a diameter of 7 Cm., plainly folded, one within the other (the triple fold of the inner filter being laid against the single side of the outer filter), wet them well with ether, and decant the ethereal solution as completely as possible upon the inner filter. Add 10 C.c. of ether to the contents of the flask, rotate it, and again decant the ethereal layer upon the inner filter. Repeat this operation with another portion of 10 C.c. of ether. Then pour into the filter the liquid in the flask, in portions, in such a way as to transfer the greater portion of the crystals to the filter, and, when this has passed through, transfer the remaining crystals to the filter by washing the flask with several portions of water, using not more than about 10 C.c. in all. Allow the double filter to drain, then apply water to the crystals, drop by drop, until they are practically free from mother-water, and afterwards wash them, drop by drop, from a pipette, with alcohol previously saturated with powdered morphine. When this has passed through, displace the remaining alcohol by ether, using about 10 C.c., or more if necessary. Allow the filter to dry in a moderately warm place, at a temperature not exceeding 60° C. (140° F.), until its weight remains constant, then carefully transfer the crystals to a tared watch-glass and weigh them.

The weight found, multiplied by 25, represents the amount of crystallized morphine obtained from 100 Gm. of the Extract.

EXTRACTUM PHYSOSTIGMATIS. U.S. Extract of Physostigma.

	Metric.	Old form.
Physostigma, in No. 80 powder	1000 Gm.	82 oz. av.
Alcohol, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Physostigma is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3½ fl. oz.]; mix this with the reserved portion, and evaporate, at or below the before-mentioned temperature, on a water-bath, to a pilular consistence.

EXTRACTUM PODOPHYLLI. U.S. Extract of Podophyllum.

	Metric.	Old form.
Podophyllum, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 800 C.c. [old form 25½ fl. oz.] of Alcohol with 200 C.c. [old form 6½ fl. oz.] of Water, and, having moistened the powder with 300 C.c. [old form 9½ fl. oz.] of the mixture, pack it firmly in a cylindrical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the

percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the *Podophyllum* is exhausted. Distil off the Alcohol from the tincture by means of a water-bath, and evaporate the residue, on a water-bath, to a pilular consistence.

EXTRACTUM QUASSIÆ. U. S. Extract of Quassia.

	Metric.	Old form.
Quassia, in No. 20 powder	1000 Gm.	82 oz. av.
Water, a sufficient quantity.		

Moisten the powder with 400 C.c. [old form 12½ fl. oz.] of Water, pack it firmly in a conical percolator, and gradually pour Water upon it until the infusion passes but slightly imbued with bitterness. Reduce the liquid to three-fourths of its bulk by boiling, and strain; then evaporate, by means of a water-bath, to a pilular consistence.

EXTRACTUM RHEI. U. S. Extract of Rhubarb.

	Metric.	Old form.
Rhubarb, in No. 80 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 800 C.c. [old form 25½ fl. oz.] of Alcohol with 200 C.c. [old form 6½ fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a conical percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the tincture passes nearly tasteless. Reserve the first 1000 C.c. [old form 2 pints] of the percolate, and set it aside in a warm place, until it is reduced by spontaneous evaporation to 500 C.c. [old form 1 pint]. Evaporate the remainder of the percolate, in a porcelain vessel, by means of a water-bath, at a temperature not exceeding 70° C. (158° F.), to the consistence of syrup. Mix this with the reserved portion, and continue the evaporation, at or below the before-mentioned temperature, until the mixture is reduced to a pilular consistence.

EXTRACTUM STRAMONII SEMINIS. U. S. Extract of Stramonium Seed.

[EXTRACTUM STRAMONII, PHARM. 1880.]

	Metric.	Old form.
Stramonium Seed, in No. 60 powder	1000 Gm.	82 oz. av.
Diluted Alcohol, a sufficient quantity.		

Moisten the powder with 300 C.c. [old form 9½ fl. oz.] of Diluted Alcohol, and pack it firmly in a cylindrical percolator; then add enough Diluted Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Diluted Alcohol, until 3000 C.c. [old form 6 pints] of tincture are obtained, or the Stramonium Seed is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate, and evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.]; mix this with the reserved portion, and, by means of a water-bath, evaporate at or below the before-mentioned temperature, to a pilular consistence.

EXTRACTUM TARAXACI. U.S. Extract of Taraxacum.

Taraxacum, freshly gathered in autumn, a convenient quantity,
Water, a sufficient quantity.

Slice the Taraxacum, and bruise it in a stone mortar, sprinkling Water over it from time to time, until it is reduced to a pulp; then express and strain the juice, and evaporate it in a vacuum-apparatus, or in a shallow porcelain dish, by means of a water-bath, to a pilular consistence.

Keep the Extract in a close vessel, and cover its surface with a cloth, which ought to be moistened occasionally with a little ether or chloroform.

EXTRACTUM UVÆ URSI. U.S. Extract of Uva Ursi.

	Metric.	Old form.
Uva Ursi, in No. 80 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Mix 200 C.c. [old form 6½ fl. oz.] of Alcohol with 500 C.c. [old form 16 fl. oz.] of Water, and, having moistened the powder with 400 C.c. [old form 12½ fl. oz.] of the mixture, pack it firmly in a cylindrical glass percolator; then add enough menstruum to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding menstruum, using the same proportions of Alcohol and Water as before, until the Uva Ursi is exhausted. Reserve the first 900 C.c. [old form 28½ fl. oz.] of the percolate; evaporate the remainder, at a temperature not exceeding 50° C. (122° F.), to 100 C.c. [old form 3 fl. oz.]. Mix this with the reserved portion, and evaporate, at or below the before-mentioned temperature, on a water-bath, to a pilular consistence.

Abstracts. U. S. 1880. Abstracts.

Abstracts are solid powdered preparations containing the soluble constituents of the drugs from which they are made, and bearing a definite and uniform relation to the drug. These preparations were first introduced into the U. S. Pharmacopœia of 1880, and have many advantages over ordinary extracts. They are prepared by evaporating an alcoholic tincture of a drug spontaneously and at a low temperature, mixing it with a sufficient quantity of dried sugar of milk to make the final product when dry weigh one-half the weight of the drug, and then powdering it. The following general formula exhibits the typical process. Abstracts are not official in the U. S. P. 1890, not having been used sufficiently during 1880-1890 by physicians to justify their reintroduction. One of their disadvantages is that they are not as concentrated as extracts.

General Formula.

Drug, in No. 60 powder, *two hundred parts* [or four ounces av.]; Sugar of Milk, recently dried and in fine powder, Alcohol, each, *a sufficient quantity*, To make *one hundred parts* [or two ounces av.]. Moisten the drug with *eighty parts* [or one and three-quarter fluid-ounces] of Alcohol, and pack firmly in a cylindrical glass percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until the drug is exhausted. Reserve the first *one hundred and seventy parts* [or three and one-half fluidounces] of the percolate, evaporate the remainder to *thirty parts* [or half a fluidounce] at a temperature not exceeding 50° C. (122° F.) and mix with the reserved portion. Place the mixture in an evaporating dish, and, having added *fifty parts* [or one ounce av.] of Sugar of Milk, cover it with a piece of thin muslin gauze, and set aside in a warm place, where the temperature will not rise above 50° C. (122° F.), until the mixture is dry. Lastly, having added enough Sugar of Milk to make the mixture weigh *one hundred parts* [or two ounces av.], reduce it to a fine, uniform powder. Preserve the powder in a well-stopped bottle.

The advantages possessed by abstracts may be briefly stated as follows:

1. Each abstract represents twice the strength of the drug or fluid extract from which it is prepared.

2. They are dry powders, if properly made, and thus are permanent and portable; not subject to precipitation as fluid extracts are; not liable to become hard, tough, and variable in strength, as is the case with extracts.

3. Injurious exposure to heat is entirely avoided, and the official process requires no apparatus but such as either is at hand in the pharmacy or can be easily obtained by a pharmacist operating upon the small scale.

4. The final thorough trituration of the dry powder reduces the soluble and active constituents of the drug to a pulverulent condition, the diluent is soluble, and the fine state of division of abstracts is the most favorable condition that a powder can possess to secure efficient medication.

The improvement suggested for the processes for abstracts is, that the temperature 50° C. (122° F.), which is lower than need be, for abstracts of aconite, belladonna, digitalis, hyoscyamus, ignatia, jalap, nuxvomica, podophyllum, and senega, be increased to 80° C. (176° F.).

Conium and valerian require a very low temperature, but the temperature of 80° C. (176° F.) is not injurious to those first mentioned if the evaporation of the fluid extract is quickly and carefully effected. An alcoholic fluid extract may be used to prepare an abstract from, if the menstruum used in making it was not too aqueous, and if it is free from glycerin. Dr. Squibb's modification for making abstracts from fluid extracts, as shown in the case of fluid extract of aconite, is as follows: "Put the fluid extract (a weighed quantity) upon a flat-bottomed dinner-plate and allow it to evaporate spontaneously, without heating, for twenty-four or thirty-six hours. At the end of that time there will remain upon the plate a thin layer of solid extract. Add to this extract about double its weight of powdered sugar of milk, warm the plate and contents until it can be just comfortably held in the hand, and incorporate the melted extract and powder by means of a stiff spatula. When thoroughly incorporated and cold, remove the mixture from the plate, weigh it, and add enough powdered sugar of milk to make the whole weigh one-half the original weight of the fluid extract. Finally, rub it to a fine, uniform powder, sifting it through a No. 60 sieve." Abstracts are *not* well made when the dry powdered solid extract is simply rubbed up with dry powdered sugar of milk, as suggested by some writers, because such mixtures of dry powders invariably *stratify* in time. This fault may be easily discovered on close examination, a darker layer of powdered extract being succeeded by a lighter one containing variable proportions of sugar of milk: this arrangement of the particles is largely owing to the vibration to which the bottles containing them are continually subjected on the shelves of the dispensing counter and by use elsewhere. If the U. S. 1880 process is employed, this fault does not exist, because the particles of sugar of milk become thoroughly saturated with the concentrated liquid extract when mixed together, and when the alcohol evaporates the solid extract is thoroughly diffused among, and is closely adherent to, the particles of sugar of milk: hence a dose taken from the portion at the top or at the middle of the bottle would have the same medicinal effect as one taken from the portion at the bottom.

Preservation and Administration.—Abstracts should be carefully protected from exposure to moist air. They should be kept in small bottles with mouths wide enough to admit the end of a spatula. Corks of the best quality should be used, and the bottles should not be kept near a hot flue, but in as cool a place as possible.

The following table exhibits the *eleven* U. S. 1880 abstracts in a form convenient for study:

Abstracta. U.S. 1880. Abstracta.

Name.	Finesses of Powder.	Menstruum.	To molston 240 Parts.	Quantity reserved.	Notes and Additions.
Abstractum Aconiti.	60	Alcohol.	80	170	2 per cent. Tartaric Acid added to menstruum to exhaust Aconite Root.
Belladonnæ.	60	"	80	170	From Belladonna Root.
Conii.	40	"	80	170	6 per cent. Hydrochloric Acid added to menstruum to exhaust Conium Fruit.
Digitalis.	60	"	80	170	
Hyoscyami.	60	"	80	170	
Jalapæ.	40	"	100	170	
Podophylli.	60	"	80	170	
Senegæ.	60	"	80	170	
Valerianæ.	60	"	80	170	
Ignatiæ.	60	{ Alcohol, 8 Water, 1 }	100	170	
Nucis Vomiciæ.	60	{ Alcohol, 8 Water, 1 }	100	170	

Resinæ. Resins.

The official resins are solid preparations consisting principally of the resinous principles from vegetable bodies. Official resins differ from alcoholic extracts in the fact that the latter contain all the principles in the drug which alcohol is capable of dissolving, whilst the resins contain only those principles which are soluble in alcohol and are insoluble in water. It is obvious that the resins prepared from those drugs which owe their activity exclusively to resinous principles, which are insoluble in water, are stronger preparations than the alcoholic extracts from such drugs. *Five* resins are official :

Official Resins.

Name.	Preparation.
Resina	By-product, the residue left from distilling Oil of Turpentine.
Copaibæ	By-product, the residue left after distilling off the volatile oil from Copaiba.
Jalapæ	Percolate Jalap, in No. 60 powder, with Alcohol until the tincture ceases to produce more than a slight turbidity when dropped into water. Distil off the Alcohol, and add the concentrated tincture to water, collect, wash, drain, and dry the precipitate.
Podophylli	Percolate Podophyllum, in No. 60 powder, with Alcohol until the tincture ceases to produce more than a slight turbidity when dropped into water. Distil off the Alcohol, and add the concentrated tincture to cold water, acidulated with 1 per cent. of Hydrochloric Acid, collect, wash, drain, and dry the precipitate.
Scammonii	Digest Scammony with boiling Alcohol until exhausted, mix the tinctures, distil off the alcohol, add the concentrated tincture to water, wash and dry the precipitate.

RESINA. U.S. Resin.

[COLOPHONY.]

The residue left after distilling off the volatile oil from Turpentine.

A transparent, amber-colored substance, hard, brittle, pulverizable; fracture glossy and shallow-conchoidal; odor and taste faintly terebinthinate. Specific gravity 1.070 to 1.080.

Soluble in alcohol, ether, and fixed or volatile oils; also in solution of potassium or sodium hydrate.

RESINA COPAIBÆ. U.S. Resin of Copaiba.

The residue left after distilling off the volatile oil from Copaiba.

A yellowish or brownish-yellow, brittle resin, having a slight odor and taste of copaiba.

Soluble in alcohol, ether, chloroform, carbon disulphide, benzol, or amyl alcohol.

RESINA JALAPÆ. U.S. Resin of Jalap.

	Metric.	Old form.
Jalap, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the powder with 300 C.c. [old form 9½ fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until 2500 C.c. [old form 5 pints] of tincture are obtained, or until the tincture ceases to produce more than a slight turbidity when dropped into water. Distil off the Alcohol, by means of a water-bath, until the tincture is reduced to 400 Gm. [old form 12½ fl. oz.], and add the latter, with constant stirring, to 9000 C.c. [old form 18 pints] of Water. When the precipitate has subsided, decant the supernatant liquid, and wash the precipitate twice, by decantation, with fresh portions of Water. Place it upon a strainer, and, having pressed out the liquid, dry the Resin with a gentle heat, stirring occasionally until the moisture has evaporated.

Yellowish-brown, or brown masses or fragments, breaking with a resinous, glossy fracture, translucent at the edges, or a yellowish-gray or yellowish-brown powder, having a slight, peculiar odor, and a somewhat acid taste. Permanent in the air.

Its alcoholic solution has a faintly acid reaction.

Soluble in alcohol in all proportions; insoluble in carbon disulphide, benzol, and fixed or volatile oils. Not more than about 10 per cent. of it is soluble in ether.

On evaporating the ethereal solution, and dissolving the residue in potassium hydrate T.S., a reddish-brown liquid is formed, from which the resin is reprecipitated by acids. If that portion of Resin of Jalap which remained undissolved by ether be dissolved in potassium hydrate T.S., the addition of an acid does not precipitate it.

Resin of Jalap should not suffer any material loss of weight when heated at 100° C. (212° F.) (absence of water).

Water triturated with it should neither become colored, nor take up anything soluble from it (absence of soluble impurities).

On digesting 1 Gm. of Resin of Jalap for about an hour, with frequent agitation, in a glass-stoppered vial, with 10 C.c. of ammonia water, at a temperature of about

80° C. (176° F.), it should yield a solution which does not gelatinize on cooling (absence of *common resin*).

RESINA PODOPHYLLI. U. S. Resin of Podophyllum.

	Metric.	Old form.
Podophyllum, in No. 60 powder	1000 Gm.	82 oz. av.
Hydrochloric Acid	10 C.c.	150 minims.
Alcohol,		
Water, each, a sufficient quantity.		

Moisten the powder with 480 C.c. [old form 15 fl. oz.] of Alcohol, and pack it firmly in a cylindrical percolator; then add enough Alcohol to saturate the powder and leave a stratum above it. When the liquid begins to drop from the percolator, close the lower orifice, and, having closely covered the percolator, macerate for forty-eight hours. Then allow the percolation to proceed, gradually adding Alcohol, until 1600 C.c. [old form 3½ pints] of tincture are obtained, or until the tincture ceases to produce more than a slight turbidity when dropped into water. Distil off the Alcohol, by means of a water-bath, until the tincture is reduced to a syrupy consistence, and pour it slowly, with constant stirring, into 1000 C.c. [old form 2 pints] of Water, previously cooled to a temperature below 10° C. (50° F.), and mixed with the Hydrochloric Acid. When the precipitate has subsided, decant the supernatant liquid, and wash the precipitate twice, by decantation, with fresh portions of cold Water. Spread it, in a thin layer, upon a strainer, and dry the Resin by exposure to the air, in a cool place. Should it coalesce during the drying, or aggregate into lumps having a varnish-like surface, it should be removed, broken in pieces, and rubbed in a mortar. As this is liable to happen during warm weather, Resin of Podophyllum is preferably made during the cold season.

An amorphous powder, varying in color from grayish-white to pale greenish-yellow or yellowish-green, turning darker when exposed to a heat over 85° C. (95° F.); having a slight, peculiar odor, and a peculiar, faintly bitter taste. Permanent in the air.

Its alcoholic solution has a faintly acid reaction.

Soluble in alcohol in all proportions; ether dissolves 15 to 20 per cent. of it; boiling water dissolves about 80 per cent., and deposits most of it again on cooling, the remaining, clear aqueous solution having a bitter taste, and turning brown on the addition of ferric chloride T.S.

Resin of Podophyllum is also soluble in potassium or sodium hydrate T.S., forming a deep yellow liquid, which gradually becomes darker, and from which the resin is reprecipitated by acids.

RESINA SCAMMONII. U. S. Resin of Scammony.

	Metric.	Old form.
Scammony, in No. 60 powder	1000 Gm.	82 oz. av.
Alcohol,		
Water, each, a sufficient quantity.		

Digest the Scammony with successive portions of boiling Alcohol until it is exhausted. Mix the tinctures, and reduce the mixture to a syrupy consistence by distilling off the Alcohol. Then add the residue in a thin stream, with active stirring, to 2500 C.c. [old form 5

pints] of Water, separate the precipitate formed, wash it thoroughly with Water, and dry it with a gentle heat.

Yellowish-brown or brownish-yellow masses or fragments, breaking with a glossy, resinous fracture, translucent at the edges; or a yellowish-white or grayish-white powder, having a faint, peculiar odor, and a slight, peculiar taste.

Soluble in alcohol in all proportions; also wholly soluble in ether and in oil of turpentine. Ammonia water and solutions of alkalies dissolve it with the aid of a gentle heat; from these solutions the resin is not reprecipitated by acids.

QUESTIONS ON CHAPTER XXX.

SOLID PREPARATIONS MADE BY PERCOLATION.

What are extracts?

What various menstrua are used in making them?

By what names are such extracts called?

What are inspissated juices?

Why are alcoholic extracts preferred to those made from inspissated juices?

What representative of this class of preparations is official in the U. S. P.?

How are these juices prepared by the British Pharmacopœia?

How have extracts been prepared by the freezing process?

Do the percolates or expressed juices of drugs contain anything in addition to the active principles?

What proximate principles are most commonly present in extracts?

Which of these principles are absent when a menstruum of part alcohol is used?

What is meant by extractive?

What name was proposed for this substance by Berzelius?

Why are extracts variable in strength?

What is the Pharmacopœia's standard for the consistence of extracts?

In what respect have "abstracts" an advantage over "extracts"?

Are extracts a reliable class of preparations?

How may extracts be preserved?

Give the general formula for alcoholic extracts?

To what extracts is glycerin added?

How many official extracts are there?

Give the Latin official name, menstruum, and mode of preparing extract of aconite, aloes, Indian cannabis, cimicifuga, colchicum root, compound extract of colocynth, gentian, jalap, opium, taraxacum, uva ursi, juglans, mezereum, physostigma, nux vomica, cinchona, podophyllum, iris, rhubarb, belladonna (leaves), digitalis, leptandra, hyoscyamus, arnica root, colocynth, conium (fruit), euonymus, stramonium (seed).

How many official extracts are made with an aqueous menstruum? Name them.

Which one is percolated with water containing five per cent. of water of ammonia?

Which is made with a menstruum of water containing 23.8 per cent. of official acetic acid?

Which by evaporating a fluid extract?

Which by mixing extracts with aromatics?

Which one is an inspissated juice?

What kind of cinchona is directed to be used in extract of cinchona?

What are the ingredients of compound extract of colocynth?

What fineness of powder is directed?

What is the consistence of the finished product?

What is the strength of extract of ergot?

From what plant is extract of glycyrrhiza obtained?

How much of it should be soluble in cold water?

Why should the use of metallic vessels be avoided in making extract of hæmatoxylon?

Should metallic vessels be avoided in making extract of krameria? Why?

- What are abstracts?
- When were they introduced into the U. S. P.?
- Are abstracts now official?
- Give the general formula for their preparation.
- What advantages do they possess over ordinary extracts?
- What improvements for making abstracts may be suggested?
- What is Dr. Squibb's modification of the process?
- Can abstracts be made satisfactorily from solid extracts? Why not?
- What are official resins?
- How are they prepared?
- In what respect do they differ from alcoholic extracts?
- How many resins are official? Name them.
- How is resin of copaiba prepared? Give a description of it.
- Give the Latin name and menstruum of resin of jalap.
- How is it prepared?
- How may it be distinguished from resin of podophyllum? From resin of scammony?
- Give the Latin name and menstruum of podophyllum. Resin of scammony.
- How may these be distinguished?

CHAPTER XXXI.

SOLID OFFICIAL PREPARATIONS MADE WITHOUT PERCOLATION.

It is not the intention in this chapter to consider *in detail* the classes of solid official preparations included in the above title, because their manufacture either belongs to the domain of extemporaneous pharmacy or is intimately connected with it. They are more appropriately treated in the final chapters of the work, because their preparation generally demands a higher degree of skill, and a more intimate knowledge of the physical properties of medicinal substances, than are necessary in making those which have been heretofore considered. For these reasons it has been the author's custom, in lecturing upon the subjects treated of in this work, to reserve the consideration of the solid official preparations made without percolation, and those which are embraced under the general term "extemporaneous," until after the student has studied the physical and chemical properties of the various substances which compose the *materia medica*. It is well for the student to have sufficient knowledge of these preparations to be able to define each class, so that when they are incidentally mentioned in Parts III. and IV. he may be able to describe the use and appearance of a powder, troche, plaster, pill, etc. If it is considered desirable to deviate from this plan, the chapters on these subjects are so constructed that the student may easily turn to them and study them out of the order given here. They will be found in Part VI.

It will be well, however, in this place, in order to keep the classification in view, to enumerate them briefly. They are Pills, Troches, Masses, Confections, Powders, Triturations, Suppositories, Cerates, Ointments, Plasters, and Papers. Among those intended for internal administration pills and troches are largely used, and, because their preparation requires the drugs to be in the form of powder, the classes termed powders and triturations, which are dispensed extemporaneously, are grouped with them. Masses and confections are of course considered in connection with pills, because they are used in their preparation. Suppositories stand alone as a class, whilst cerates, ointments, plasters, and papers form a natural group, being preparations that are used externally.

PART III.

INORGANIC SUBSTANCES.

INTRODUCTORY.

THE various operations and processes which are used in the practice of pharmacy having been treated of in their general relations to one another in the preceding chapters, it is now necessary to consider in detail the physical and chemical properties of the substances that enter into the preparations which are used in medicine.

The plan which will be followed presupposes on the part of the student a knowledge of elementary chemistry, and hence chemical physics, nomenclature, the theoretical construction of formulæ, etc., will not be entered into. The great number of valuable text-books on chemistry, now accessible to every student, renders the introduction of even brief articles on these subjects unnecessary, and the space will be reserved for the consideration of the chemical substances of the *materia medica* from a pharmaceutical stand-point. For reasons which need not be entered into here, the latest (and to some extent conflicting) views of modern chemists upon the classification of these substances are not adopted, but a method is employed which, whilst it does not do violence to the accepted theories, is simple and practical. The substances are grouped together according to their physical or therapeutical properties, whilst their supposed chemical analogies have not been entirely overlooked. This plan has the merit of giving the student a different view of the chemical substances from that to which he is accustomed in his study of chemistry, and will, perhaps, enhance the interest and impress the points of difference in the substances more forcibly upon the mind.

As an illustration, the chemical properties of the non-metallic elements—Hydrogen, Oxygen, and Nitrogen—will not be noticed at length; they are not recognized articles of the *materia medica* in their free state; but the acids, bases, and salts containing them are largely used, and they form substances which can be advantageously grouped together for profitable study by the pharmacist.

The table which follows gives the symbols and atomic weights of the elements; those which are of special interest from a pharmaceutical point of view are distinguished from the rest by being printed in heavier type. The figures given in the last column are those of Meyer and Seubert, and are now official.

Table of Elementary Substances.

Element.	Sym- bol.	Atomic Weight.	Official Atomic Weight.	Element.	Sym- bol.	Atomic Weight.	Official Atomic Weight.
Aluminum . .	Al	27	27.04	Molybdenum .	Mo	95.5	95.9

CHAPTER XXXII.

HYDROGEN, OXYGEN, AND WATER.

H; 1. O; 15.96. H_2O ; 17.96.

Hydrogen is a colorless, inodorous, and combustible gas; it is the lightest of all substances. Chemically, it is one of the most important and interesting of the elements, the atomic weights of all being referred to it as unity. Pharmaceutically, in its uncombined state, it is of very little importance, and the reader is referred, for further information, to the chemical text-books.

Oxygen, as usually seen, is a colorless, inodorous gas which aids combustion; it is the most abundant of the elements, forming about one-fifth of the total weight of our atmosphere. Water contains nearly ninety per cent. by weight of oxygen, and it is present in varying quantities in most vegetable and animal substances. The compounds which it forms with other bodies are termed oxides: these are of great pharmaceutical interest, and they will be considered hereafter under their appropriate heads. Oxygen in its free, gaseous condition is sometimes used medicinally, but in this state it is of little importance in pharmacy.

AQUA. U. S. Water.

$H_2O = 17.96$.

Natural water in its purest attainable state.

Water is the most important and useful compound known to the pharmacist: its molecule, H_2O , is composed of two parts of hydrogen and one part of oxygen.

The purity of water is specified in the official description, which is as follows:

Aqua. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
A colorless, limpid liquid, without odor and taste at ordinary temperatures, and remaining odorless while being heated to boiling, of a perfectly neutral reaction.	Metallio impurities.	The transparency or color of Water should not be affected by hydrogen sulphide T.S. or ammonium sulphide T.S. If 200 C.c. of Water be acidulated with hydrochloric acid and heated to boiling, and 0.5 Gm. of barium chloride T.S. added, the liquid, cooled and filtered, should give no further precipitate on the addition of a few drops of barium chloride T.S., even on standing. It should remain unaffected by mercuric chloride T.S. On evaporating 1000 C.c. of Water on a water-bath, it should not leave a residue weighing more than 0.5 Gm. The above residue, when ignited, should not carbonize. If 200 C.c. of Water be acidulated with nitric acid and 0.5 C.c. of decinormal silver nitrate V.S. be added, the filtered liquid should not be affected by the subsequent addition of a few drops of silver nitrate T.S.
	Sulphates.	
	Ammonia.	
	Soluble salts.	
	Ammoniacal or acid vapors.	
	Chlorides.	

Aqua. U.S.	IMPURITIES.	TESTS FOR IMPURITIES.
	More than traces of organic or other oxidisable matters.	On heating 100 C.c. of Water acidulated with 10 C.c. of diluted sulphuric acid to boiling, and adding 0.5 C.c. of decinormal potassium permanganate V.S. to impart to the liquid a decided rose-red tint, this tint should not be entirely destroyed by boiling for ten minutes.
	Nitrites.	If 100 C.c. of Water be acidulated with diluted sulphuric acid free from nitrose, and a few drops of zinc-iodide starch T.S. subsequently added, the liquid should not at once assume a blue or violet color.
	Nitrates.	If 5 C.c. of Water mixed with a few drops of diphenylamine T.S. be carefully poured upon about 2 C.c. of sulphuric acid, free from nitrose, contained in a test-tube, so as to form a separate layer, no blue color should be formed at the line of contact of the two liquids.

Uses.—The powers and uses of water as a solvent have been already noticed in the previous chapters. The United States Pharmacopœia directs water, under the name of Aqua, or distilled water, under the name of Aqua Destillata, to be used in the various processes according to the necessities of the occasion. Ordinary water always contains solid matter and traces of various salts in solution or suspension: these do not unfit it for drinking purposes, but would often seriously interfere with the purity of many chemical substances if such water were used in their preparation. The official processes err on the safe side, and direct distilled water in all cases where the use of ordinary water might be injurious or of doubtful propriety. In some sections of the country the drinking-water might be pure enough for the processes, or at least not contain serious impurities; in other sections the water would be totally unfit for the preparations. The purity of official distilled water is beyond question, and its use therefore removes all doubts.

For distilled water the tests for purity are, of course, much more exacting (see below).

Aqua Destillata. U.S.	IMPURITIES.	TESTS FOR IMPURITIES.
A colorless, limpid liquid, without odor or taste, and of a neutral reaction. On evaporating 1000 C.c. of Distilled Water, on a water-bath, to dryness, no residue should remain.	Metals.	The transparency or color of Distilled Water should not be affected by any of the following tests: Hydrogen sulphide or ammonium sulphide T.S. Barium chloride T.S. Silver nitrate T.S. Ammonium oxalate T.S. Mercuric chloride T.S.
	Sulphate.	
	Chloride.	
	Calcium.	
	Ammonium Salts, or Free Ammonia.	Twice its volume of calcium hydrate T.S. It should give no reaction for these, when tested as described under Aqua. On heating 100 C.c. of Distilled Water, acidulated with 10 C.c. of diluted sulphuric acid, to boiling, and adding 1 C.c. of centinormal potassium permanganate V.S. to impart to the liquid a decided rose-red tint, this tint should not be entirely destroyed by boiling for ten minutes, nor by subsequently setting the vessel aside, well covered, for ten hours.
	Carbonic acid.	
	Nitrites or Nitrates.	
	Organic or other oxidisable matters.	

Uses.—Distilled water is used in pharmacy principally as a solvent for delicate chemical salts, and for purposes for which ordinary water is unfitted (see page 469).

AQUA HYDROGENII DIOXIDI. U. S. Solution of Hydrogen Dioxide.

[SOLUTION OF HYDROGEN PEROXIDE.]

A slightly acid, aqueous solution of Hydrogen Dioxide (H_2O_2 — 38.92) containing, when freshly prepared, about 8 per cent., by weight, of the pure Dioxide, corresponding to about 10 volumes of available oxygen. Specific gravity, about 1.006 to 1.012 at 15° C. (59° F.).

This is a valuable addition to the official preparations of the U. S. P. 1890. It is made commercially now on a large scale. Its method of preparation, by decomposing barium dioxide with phosphoric acid, will be found in detail on page 290.

Any trace of barium salt in the solution of hydrogen dioxide remaining after the decomposition is removed by the cautious addition of sulphuric acid, which precipitates an insoluble barium sulphate.

Aqua Hydrogenii Dioxid. U. S.	ODOR, TASTE, REACTION, ETC.	SOLUBILITIES.	
		Water.	Alcohol.
A colorless liquid; liable to deteriorate by age, exposure to heat, or protracted agitation. When exposed to the air at the ordinary temperature, or when heated on a water-bath at a temperature not exceeding 60° C. (140° F.), the Solution loses chiefly water. When rapidly heated, it is liable to decompose suddenly.	Odorless, slightly acidulous to the taste, producing a peculiar sensation and soapy froth in the mouth. Acid reaction due to small amount of free acid allowed to remain in it for preservation. Sp. gr. 1.006 to 1.012 at 15° C. (59° F.).	Miscible in all proportions.	Miscible in all proportions.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
On adding 10 C.c. of water, in a test-tube, 1 drop of potassium chromate T.S., then 10 drops of diluted sulphuric acid, and pouring a few C.c. of ether on top, the subsequent addition of a few drops of Solution of Hydrogen Dioxide, even when considerably diluted, will cause a blue color to appear at the zone of contact of the two liquids. After shaking, the ethereal layer will separate with a blue color.	Hydrofluoric acid.	Upon evaporating 50 C.c. of the Solution, previously rendered alkaline by sodium hydrate T.S. to dryness, transferring the dry residue to a watch-glass, moistening it with sulphuric acid, and setting the glass in a moderately warm place for a few hours, the surface of the glass, after being washed, should exhibit no sign of corrosion. 50 C.c. of the Solution should not require more than 0.5 C.c. of potassium hydrate V.S. to render the liquid alkaline, phenolphthalein being used as an indicator. The addition of a few drops of diluted sulphuric acid to 10 C.c. of the Solution should produce no turbidity or precipitate.	
On evaporating 50 C.c. of the Solution to dryness, on a water-bath, not more than 0.25 Gm. of residue should remain.	Limit of free acid.		
	Barium.		

Valuation of Solution of Hydrogen Dioxide.

Dilute 10 C.c. of the Solution with water to make 100 C.c. Transfer 17 C.c. of this liquid (containing 1.7 C.c. of the Solution) to a beaker, add 5 C.c. of diluted sulphuric acid, and then, from a burette, decinormal potassium permanganate V.S., until the liquid just retains a faint pink tint after being stirred. Each C.c. of the decinormal potassium permanganate V.S. corresponds to 0.0017 Gm. of absolute Hydrogen Dioxide.

To express the strength of any solution of Hydrogen Dioxide approximately in *volumes of available oxygen* (that is, in volumes of oxygen given off by 1 volume of the Solution upon decomposition), multiply the number of C.c. of decinormal permanganate V.S. decolorized by 1 C.c. of the Solution, by 0.56 (0.5594); or those decolorized by 1.7 C.c. of the Solution, by 0.38. (It is assumed that 1000 C.c. of oxygen, at 0° C. (32° F.) and 760 Mm. pressure, weigh 1.48 Gm.)

To express the strength in *percentage (by weight) of absolute Hydrogen Dioxide*, multiply the number of C.c. of decinormal permanganate V.S. decolorized by 1 C.c. of it, by 0.17; or divide the number of C.c. of permanganate V.S. decolorized by 1.7 C.c. of it, by 10.

Uses.—Solution of hydrogen dioxide (or peroxide, as it is usually termed) is an energetic antiseptic and disinfectant; as found in commerce, it is designated as a 15 vol., 10 vol., 8 vol. solution, etc., by which is meant a solution of the hydrogen dioxide which will yield 15 volumes, 10 volumes, or 8 volumes of active oxygen when used. Diluted solutions are employed as local applications and in inflammations of mucous membranes. It is probably free from poisonous properties. *Great care must be exercised to prevent decomposition, and the bottles containing the solution must be kept in a cool place.*

CHAPTER XXXIII.

THE INORGANIC ACIDS.

THE inorganic acids form one of the most important classes of compounds used in pharmacy. Acids are distinguished from other bodies by the following properties: 1. They all contain hydrogen, and are sometimes called hydrogen salts. The hydrogen is capable of being replaced by metals. 2. Those which are soluble in water have a characteristic sour taste and corrosive action. 3. They act on litmus and other vegetable substances, changing their color.

The official inorganic acids will be considered in the following order: 1. Those which do not contain oxygen, or *hydracids*, and which are derived from non-metallic elements,—viz., Hydrochloric and Hydrobromic Acids. 2. The non-metallic oxygen acids,—Nitric, Nitrohydrochloric, Sulphuric, Sulphurous, Hypophosphorous, and Phosphoric Acids. 3. Those obtained from metallic elements,—Arsenous and Chromic Acids,—and now termed anhydrides, including the weak acid obtained from Boron, will not be treated as acids, but will be described under the headings of the elements from which they are formed.

The names of the acids which contain oxygen vary in their terminations like the salts of certain metals,—the suffixes *ous* and *ic* being used, the former to denote the lower proportion of oxygen, the latter the higher. Thus, sulphurous acid, H_2SO_3 , contains less oxygen than sulphuric acid, H_2SO_4 ; nitrous acid, HNO_2 , less than nitric acid, HNO_3 , etc.

Practical Points in Handling Strong Acids.—The strong inorganic acids are never made by the pharmacist for commercial purposes, as they can be manufactured much more economically upon the large scale. They are corrosive in their action, and must be handled very cautiously to avoid personal injury. They are usually sent out by manufacturers in one-pound, or in five-pint, glass-stoppered bottles, or in carboys holding about ten gallons. One of the common annoyances is the liability of the glass stopper to become so tightly fastened in the neck of the bottle that it is

FIG. 348.

Stopper-wrench.

One of the common annoyances is the liability of the glass stopper to become so tightly fastened in the neck of the bottle that it is

extracted with difficulty. As this always happens with bottles which have well-fitting and hence most valuable stoppers, it becomes an object to extract the stopper without injury. This may frequently be done by grasping the bottle firmly, and, after cleaning off the lute, carefully tapping the stopper *gently* with the *wooden* handle of a pestle or spatula. If very moderate measures do not succeed, the stopper-wrench (see Fig. 348) should be used. This is made of hard wood, of the shape shown in the cut, the upper cut giving the end view and showing the relative sizes of three holes in the wrench. These should be made somewhat larger than the stoppers of the bottles that the wrench is likely to be used for. The lower cut gives the side view of the wrench, which is shaped to fit the hand, and shows the relative depths of the holes. The refractory stopper is placed in the hole, and the operator grasps the wrench with the right hand and endeavors to twist the stopper out. If it does not yield to moderate treatment, the neck of the bottle may be cautiously heated by wrapping it in a cloth wet with hot water, or by means of a spirit-lamp or Bunsen burner with a low flame, passing the flame quickly around it several times so that it shall be uniformly heated. This will cause expansion of the neck, and if the right moment be seized, which is just before the outer surface of the stopper becomes correspondingly heated, the stopper may be easily extracted, the principle of action depending upon unequal expansion. If these means do not succeed, the bottle should be inverted in a vessel of warm water to a depth sufficient to cover the neck, and allowed to remain several hours; if the wrench is then used, success is generally assured. Corks should not be used as stoppers for the strong acids, because of the corrosive action of the latter on them,—a portion of the cork almost invariably contaminating and discoloring the acid.

The handling of carboys containing strong acids is sometimes attended with difficulty and danger. The simplest method known to the author is by the use of Stevenson's carboy rocker (see Fig. 349). This

FIG. 349.

Use of carboy rocker.

consists of a solid elastic steel rod bent into the shape shown in the cut. To place it in position, the carboy is tilted until it rests on a bottom corner; the closed end of the rocker is then pushed into place on the

bottom edge, and the springs adjust themselves to the upper edge of the carboy. The latter can then be tilted easily and without spilling the contents. The last drop can be poured out readily.

Quality of Commercial Acids.—Two grades of acids are found in commerce. The first is designated as C. P. (chemically pure), and this is the quality indicated by the U. S. Pharmacopœia to be used in making preparations and for tests, etc. The lower grade is sometimes known as medicinally pure, and is intended to be employed in the arts and for common uses.

Too much importance cannot be attached to the duty of securing pure and strong acids. The introduction of full and reliable tests in the Pharmacopœia of 1890 leaves the pharmacist without excuse if he neglects their careful examination. They are used in many of the qualitative and quantitative official tests. If the reagent used for testing is impure itself, the substance which is suspected and is being tested will fall under condemnation when it may be absolutely faultless. Then, again, loss and annoyance in making many preparations, like the iron salts and solutions, will surely follow the use of acids deficient in strength and purity.

Strength of the Official Acids.—The official inorganic acids are mostly solutions of gaseous acids in water, and no uniformity is to be found among them in the amount of water contained in the strong acids. For instance, hydrochloric acid contains 31.9 per cent. of gaseous hydrochloric acid; nitric acid contains 68 per cent. of gaseous nitric acid; and sulphuric acid contains 92.5 per cent. of absolute sulphuric acid. On the other hand, the *diluted* acids are intended to be uniform,—diluted hydrochloric, nitric, and sulphuric acids each containing 10 per cent. of absolute acid.

Medical Properties.—The inorganic acids are generally tonic and refrigerant when administered in a diluted condition; externally, if applied undiluted, they are caustic and corrosive, and should be used with the greatest care. Brushes made of spun glass are sometimes employed to apply strong acids externally to ulcers. Test-bottles with elongated stoppers, or the bottle shown in Fig. 350, are also advantageously used. One of the principal difficulties attendant upon the internal administration of acids is their injurious action upon the teeth. To avoid the destructive contact with the enamel, the diluted acid should be sucked through a narrow glass tube.

Antidotes.—The strong acids are sometimes accidentally taken internally in poisonous doses; their corrosive action is rapidly manifested, and dangerous results may be justly apprehended. *Mild* alkalis in large doses should at once be administered in connection with some bland fixed oil. Lime liniment is usually upon the shelf already prepared, and valuable time may often be saved by at once giving it to the patient in large doses. Soap or either of the sodium carbonates in dilute solution may be given.

Official Inorganic Acids.

ACIDUM HYDROCHLORICUM. U.S. Hydrochloric Acid.

[MURIATIC ACID.]

A liquid composed of 81.9 per cent. by weight of absolute Hydrochloric Acid [HCl; 36.37] and 68.1 per cent. of water.

Preparation.—Hydrochloric acid, the only known compound of chlorine and hydrogen, is made on a very large scale both abroad and in this country. It is obtained most cheaply as a by-product resulting from the manufacture of soda-ash, by decomposing common salt heated to a high temperature with sulphuric acid. Sodium sulphate is formed, and gaseous hydrochloric acid is liberated. The latter is conducted into a tall tower filled with coke, called a coke-scrubber; the ascending gas is met by a descending flow of water, which trickles from a reservoir near the top. The gas readily dissolves in the water, and the relative quantities are so arranged that a strong solution passes out at the bottom of the tower. A purer product is formed by selecting the sodium chloride and sulphuric acid and using a series of stone-ware jars shaped like Woulfe's bottles. About 120 parts of the salt require 100 parts of strong sulphuric acid. Two steps in the process are recognized. In the first reaction but one-half of the sodium chloride is decomposed, the decomposition of the remainder being effected at a temperature of 220° C. (428° F.) or over. The reaction is thus shown:

and the residue, when heated, yields the rest of the hydrochloric acid, as follows :

Hydrochloric acid, or, more properly, solution of hydrochloric acid, is used in pharmacy to make the official preparations of the diluted hydrochloric acid, nitrohydrochloric acid, and diluted nitrohydrochloric acid, in the preparation of chlorine water, chlorides, and many other compounds. The yellow color of the common acid is generally due to organic substances or a trace of iron; the white fumes produced when the acid is exposed to the air are caused by the gaseous acid combining with the moisture in the air, and also with a trace of ammonia usually present, forming ammonium chloride. The official description and tests are as follows :

Acidum Hydrochloricum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless, fuming liquid; fumes and odor disappear on diluting the Acid with 2 volumes of water. By heat it is completely volatilized. Sp. gr. 1.183.	Pungent, suffocating odor; intensely acid taste; strongly acid reaction.	Miscible, in all proportions, with water and alcohol.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>On heating it, at first a stronger acid passes off, until, at 110° C. (230° F.), a liquid containing 20.18 per cent. of the absolute acid remains (specific gravity about 1.102 at 15° C.), which distills unchanged, leaving no residue, if the Acid was perfectly pure; heated with manganese dioxide, an abundance of chlorine gas is given off.</p> <p>To neutralize 3.64 Gm. of the Acid, diluted with 10 C.c. of water, should require 31.9 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the <i>absolute acid</i>), phenolphthalein being used as indicator.</p>	Thallium, Arsenic, Lead, etc.	<p>When a few C.c. of freshly saturated hydrogen sulphide T.S. are poured carefully on top of an equal volume of the Acid, no color should develop at the zone of contact.</p> <p>A few drops of chloroform, added to 1 C.c. of the Acid diluted with 2 C.c. of water, should not become colored, either at once, or after the addition of a few drops of freshly prepared chlorine water, or of a granule of potassium chlorate.</p> <p>With silver nitrate T.S. it yields a white, curdy precipitate, insoluble in nitric acid, but readily soluble in ammonia water, forming a colorless liquid.</p> <p>If 1 C.c. of the Acid be slightly supersaturated with ammonia water, and 1 C.c. of ammonium sulphide T.S. added, neither a color nor a turbidity should appear.</p> <p>If 10 C.c. of the Acid be evaporated from a platinum or porcelain capsule, not more than a bare trace of residue should remain.</p> <p>If 1 C.c. of the Acid be diluted with 5 C.c. of water and 0.5 C.c. of zinc-iodide starch T.S. added, no blue color should appear.</p> <p>If 1 C.c. of the Acid be diluted with 5 C.c. of water, and a few drops of barium chloride T.S. added, no precipitate or turbidity should appear within one hour.</p> <p>Nor should the addition to the above mixture of a few drops of decinormal iodine V.S. produce any turbidity.</p> <p>On adding 1 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorf's Test for Arsenic), together with a small piece of pure tin-foil, to 1 C.c. of the Acid, no coloration should occur within one hour.</p>
	Iodine or Bromine.	
	Copper.	
	Iron, Aluminium, etc.	
	Non-volatile impurities.	
	Chlorine or Bromine.	
	Sulphuric Acid.	
	Sulphurous Acid.	
	Arsenic.	

Uses.—Hydrochloric acid is largely used in making chlorides and other preparations. Medicinally it is usually prescribed in a diluted form. The dose is five to ten minims (0.3 to 0.6 C.c.).

ACIDUM HYDROCHLORICUM DILUTUM. U.S. Diluted Hydrochloric Acid.

[DILUTED MURIATIC ACID.]

	Metric.	Old form.
Hydrochloric Acid	100 Gm.	5½ fl. oz.
Distilled Water	21½ Gm.	14 fl. oz.
To make	319 Gm.	19½ fl. oz.

Mix them. Keep the product in glass-stoppered bottles.

A colorless liquid, containing 10 per cent. by weight of absolute hydrochloric acid. Specific gravity about 1.050.

The official test of strength is as follows:

To neutralize 3.64 Gm. of Diluted Hydrochloric Acid should require 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the absolute acid), phenolphthalein being used as indicator.

The tests for impurities are those of hydrochloric acid.

Uses.—Diluted hydrochloric acid is used as a refrigerant and tonic, in doses of fifteen to thirty minims (1 to 2 C.c.), largely diluted with water. It should be sucked through a glass tube or a straw, to avoid injury to the teeth.

ACIDUM HYDROBROMICUM DILUTUM. U.S. Diluted Hydrobromic Acid.

A liquid composed of 10 per cent., by weight, of absolute Hydrobromic Acid [$\text{HBr} = 80.76$], and 90 per cent. of Water.

Preparation.—Two methods are generally used for making this preparation,—one by distillation, the other by double decomposition and precipitation. The former method yields the purer product, the latter is the more convenient. For other methods of preparation, see U.S. Dispensatory, 17th ed., p. 51.

Diluted Hydrobromic Acid (Distillation Process).—Take of Potassium Bromide and Sulphuric Acid, each, 150 parts, Distilled Water, a sufficient quantity. Add the Sulphuric Acid to 25 parts of Distilled Water, and cool the mixture. Then dissolve the Potassium Bromide in 150 parts of water by the aid of heat, supplying the loss of water by evaporation during the heating. Carefully pour the diluted Sulphuric Acid into the hot solution with constant stirring, and set the mixture aside for twenty-four hours, in order that the Potassium Sulphate may crystallize. Pour off the liquid into a retort, break up the crystalline mass, transfer it to a funnel, and, having drained the crystals, drop slowly upon them 50 parts of cold Distilled Water so as to wash out the acid liquid. Add this liquid to that in the retort, and distil nearly to dryness at a moderate heat. If red fumes of bromine are given off during any stage of the distillation, change the receiver

as soon as such fumes cease to appear. Finally determine in the distillate the amount of actual Hydrobromic Acid (8.08 Gm. should require 10 C.c. of normal potassium hydrate V.S.), and add to the remaining weighed distillate such an amount of cold Distilled Water as shall cause the finished acid to contain 10 per cent. of actual Hydrobromic Acid.

This process is based upon that proposed by Dr. E. R. Squibb, the acid preferred by him having, however, the strength of 34 per cent. instead of 10 per cent.

Diluted Hydrobromic Acid (Precipitation Process).—Dissolve 340 grains of Potassium Bromide in 4 fluidounces of Water, add 400 grains of Tartaric Acid to the solution, cool the mixture to 40° F., allowing it to stand without agitation as long as possible before pouring off the clear solution from the precipitated acid Potassium Tartrate. If it can be kept in a cool place for several weeks before it is used, it will be improved; it will contain about 10 per cent. of absolute hydrobromic acid. This method is a modification of Wade's and Fothergill's processes, and has the advantage of separating the acid potassium tartrate more effectually. The crystals which form upon the bottom and sides of the bottle act as nuclei, and in time serve to abstract all of the acid tartrate from the liquid.

Acidum Hydrobromicum Dilutum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A clear, colorless liquid. By heat completely volatilized. Sp. gr. 1.077.	Odorless; strongly acid taste; acid reaction.	Miscible in all proportions with water and alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>On distilling it, water and weak acid first pass over. When the temperature of 126° C. (258.8° F.) is reached, an acid of 47.8 per cent. remains, which may be distilled unchanged.</p> <p>On adding an equal volume of chlorine water to Diluted Hydrobromic Acid, bromine is liberated, which is soluble in chloroform, imparting to this liquid a yellow color, indicating absence of iodine. Silver nitrate T.S. causes a yellowish-white precipitate, somewhat soluble in hydrobromic acid, insoluble in diluted nitric acid, very slightly soluble in ammonia water, but more soluble in stronger ammonia water. Copper sulphate T.S. produces a deep-red color upon addition of sulphuric acid.</p> <p>To neutralize 8.08 Gm. of Diluted Hydrobromic Acid should require 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the absolute acid), phenophtalein being used as indicator.</p>	<p>Bromine.</p> <p>Sulphuric Acid.</p> <p>Arsenic.</p>	<p>On being kept for some time, the Acid should not become colored.</p> <p>Barium chloride T.S. should not produce a turbidity or precipitate.</p> <p>If 1 C.c. of the Acid be mixed with 1 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), and a small piece of pure tin-foil added, no brown coloration should appear within half an hour.</p>

Uses.—Diluted hydrobromic acid is used as a nervine and hypnotic, in doses of two fluidrachms (7.4 C.c.).

ACIDUM NITRICUM. U. S. Nitric Acid.

A liquid composed of 68 per cent., by weight, of absolute Nitric Acid [$\text{HNO}_3 = 62.89$], and 32 per cent. of Water.

Nitric Acid should be kept in dark amber-colored, glass-stoppered bottles.

Preparation.—Nitric acid is prepared from N_2O_5 , one of the five compounds of nitrogen and oxygen: these are nitrogen monoxide, or hyponitrous oxide (laughing gas), N_2O ; nitrogen dioxide, N_2O_2 or $(\text{NO})_2$; nitrous oxide, N_2O_3 ; nitrogen tetroxide or peroxide, N_2O_4 ; and nitric oxide, N_2O_5 . From this latter, by the addition of water, nitric acid is formed: $\text{N}_2\text{O}_5 + \text{H}_2\text{O} = (\text{HNO}_3)_2$. Nitric acid is prepared commercially by reacting on sodium nitrate or Chili saltpetre with sulphuric acid. Sodium nitrate is preferred as the source, because it is cheaper than potassium nitrate, and, in addition, it affords a larger yield of nitric acid. If two molecules of the sodium salt and one of sulphuric acid be taken, the reactions will be as follows:

Then, by raising the heat, the acid sodium sulphate acts upon the second molecule of sodium nitrate:

The specific gravity of the official acid, or, as it is technically termed, 43° acid, is 1.414. That which is usually furnished in commerce is not so strong as this, but has the specific gravity of 1.355, and is known as 38° acid. Care should always be observed to specify, in ordering from the manufacturing chemist or dealer, the specific gravity of the acid desired; for if preparations are to be made like the official solutions of iron, success cannot be expected if acids of official strength are not used. The reddish acid, called *nitrous acid*, is nitric acid containing more or less nitrogen tetroxide (N_2O_4). The same acid may be formed by impregnating nitric acid with nitrogen dioxide (N_2O_2).

Acidum Nitricum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless, fuming, very caustic and corrosive liquid. Sp. gr. 1.414.	Peculiar, somewhat suffocating odor; strongly acid.	Miscible, in all proportions, with water or alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
It boils at 120.5° C. (248.9° F.), and is completely volatilized. It dissolves copper, mercury, silver, and other metals with evolution of red vapors, and stains woollen fabrics and animal tissues a bright yellow. Heated with indigo T.S., it discharges the blue color of the latter.	Iron or much Lead. Copper. Lead, Iron, Copper, etc. Sulphuric Acid. Hydrochloric Acid.	If 1 C.c. of Nitric Acid be treated with a slight excess of ammonia, no precipitate should be formed. The liquid should not have a blue tint. The further addition of 2 drops of ammonium sulphide T.S. should not cause a black precipitate. A portion diluted with 5 volumes of water should afford no precipitate with barium chloride T.S. Or with silver nitrate T.S.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
To neutralise 3.145 Gm. of Nitric Acid should require 34 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 2 per cent. of absolute acid), phenolphthalein being used as indicator.	Lead, Arsenic, Copper. Iodine or Bromine. Iodic Acid or Bromic Acid.	On diluting some of the Acid with 5 times its volume of water, a portion of this liquid, when gently heated and treated with freshly prepared hydrogen sulphide T.S., should not show a colored precipitate. If the diluted Acid be shaken with a few drops of chloroform, the latter should remain colorless. After the introduction of a small piece of metallic zinc to the above mixture, no color should be developed.

Uses.—Nitric acid, sometimes called *aqua fortis*, is used in pharmaceutical operations to form nitrates and as an oxidizing agent. Free nitric acid, however, will evolve oxygen at a red heat, according to the following reaction :

It oxidizes sulphur and phosphorus, giving rise to sulphuric and phosphoric acids, and all the metals, with a few exceptions. It combines with salifiable bases and forms nitrates. Medicinally, nitric acid, when taken internally in doses of five to ten minims (0.3 to 0.6 C.c.), largely diluted, is tonic, antiseptic, and astringent; when applied to the skin it is escharotic, producing a yellow stain, due to the formation of *xanthoproteic acid*.

ACIDUM NITRICUM DILUTUM. U. S. Diluted Nitric Acid.

	Metric.	Old form.
Nitric Acid	100 Gm.	4 fl. oz.
Distilled Water	580 Gm.	29 fl. oz.
To make	680 Gm.	about 2 pints.

Mix them. Keep the product in dark amber-colored, glass-stoppered bottles.

Diluted nitric acid contains about 14.3 per cent. of official nitric acid, corresponding to 10 per cent. of absolute nitric acid. Sp. gr. 1.057. The official test of strength is that 6.29 Gm. of diluted nitric acid should require 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of absolute acid), phenolphthalein being used as indicator.

Uses.—It is used medicinally for the same purposes as the strong nitric acid; when taken internally, the dose is twenty minims (1.2 C.c.).

ACIDUM NITROHYDROCHLORICUM. U. S. Nitrohydrochloric Acid.

[NITROMURIATIC ACID.]

	Metric.	Old form.
Nitric Acid	180 C.c.	8 fl. oz.
Hydrochloric Acid	820 C.c.	18½ fl. oz.
To make	1000 C.c.	16½ fl. oz.

Mix the Acids in a capacious glass vessel, and, when effervescence has ceased, pour the product into dark amber-colored, glass-stoppered

bottles, which should not be more than half filled, and keep them in a cool place.

When nitric acid is mixed with hydrochloric acid, mutual decomposition takes place, according to the reaction

and a liquid is formed, capable of dissolving gold, called *aqua regia*.

The value of this acid depends upon the completion of the above reaction and the production of nitrosyl chloride and free chlorine. It should be kept in a cool dark place, on account of its liability to lose chlorine by heat, and to have its chlorine converted into hydrochloric acid by the action of light and the decomposition of water. On account of its tendency to decomposition, it should not be made in large quantities, nor be kept on hand very long; care should be taken not to transfer it to the bottle in which it is to be dispensed, until effervescence has ceased, lest the pressure within should drive out the stopper or cause the bottle to explode violently.

Nitrohydrochloric acid is a golden-yellow, fuming, and very corrosive liquid, having a strong odor of chlorine and a strongly acid reaction. By heat it is wholly volatilized. It readily dissolves gold leaf, and a drop added to potassium iodide T.S. liberates iodine abundantly.

Uses.—Nitrohydrochloric acid, or, as it is still called, nitromuriatic acid, is given internally in hepatic affections, in doses of three minims (0.18 C.c.) and upwards, well diluted with water. Great care should be taken in dispensing this acid, particularly if directed in combination with infusions, tinctures, etc.: the reaction occurring upon mixing should be permitted to cease entirely before dispensing, to avoid the possibility of an explosion taking place when the preparation is in the patient's hands.

ACIDUM NITROHYDROCHLORICUM DILUTUM. U. S. Diluted

Nitrohydrochloric Acid.

[DILUTED NITROMURIATIC ACID.]

	Metric.	Old form.
Nitric Acid	40 C.c.	1 fl. oz.
Hydrochloric Acid	180 C.c.	4½ fl. oz.
Distilled Water	780 C.c.	19½ fl. oz.
To make	1000 C.c.	25 fl. oz.

Mix the Acids in a capacious glass vessel, and, when effervescence has ceased, add the Distilled Water. Keep the product in dark amber-colored, glass-stoppered bottles, in a cool place.

Diluted nitrohydrochloric acid is a colorless or faintly yellow liquid, odorless or having a faint odor of chlorine, and a very acid taste and reaction. By heat it is wholly volatilized. On adding a few drops to potassium iodide T.S., iodine is liberated.

It should be made strictly according to the official directions. The acids must be mixed whilst concentrated, otherwise the nitrosyl chloride and chlorine are not produced. Hence the "rapid method," so frequently used, of mixing the acids and immediately diluting with water, does not produce an official preparation, and is reprehensible in practice.

Uses.—Diluted nitrohydrochloric acid is given in doses of ten minims (0.6 C.c.), properly diluted, as a tonic and stimulant to the liver.

ACIDUM SULPHURICUM. U.S. Sulphuric Acid.

A liquid composed of not less than 92.5 per cent., by weight, of absolute Sulphuric Acid [$H_2SO_4 = 97.82$], and not more than 7.5 per cent. of water.

The above-named percentage (92.5) is that assumed for Sulphuric Acid in the formulas of pharmacopœial preparations.

Sulphuric Acid should be kept in glass-stoppered bottles.

Preparation.—Sulphuric acid is obtained by burning sulphur or iron pyrites, FeS_2 , and allowing the product of combustion, SO_2 , to mix with nitrous fumes obtained from the decomposition of sodium nitrate, which change SO_2 into SO_3 , and this uniting with steam yields H_2SO_4 . If the sulphur were burned by itself, the product would be sulphurous oxide, which contains only two-thirds as much oxygen as sulphuric oxide. The object of the sodium nitrate is to furnish, by its decomposition, the requisite additional quantity of oxygen. To understand the process, it is necessary to remember that several of the oxides of nitrogen have oxidizing power. The reactions are thus expressed :

then

then

in which the sulphurous oxide, from the burning pyrites or sulphur, is oxidized to sulphuric oxide by the nitrogen tetroxide, which readily parts with two atoms of oxygen to such bodies as sulphurous oxide, and then takes two atoms of oxygen again from the atmosphere, regenerating the original tetroxide. The nitrogen tetroxide thus acts simply as a carrier of atmospheric oxygen, whereby the SO_2 is changed into SO_3 . This latter compound then unites with steam to form H_2SO_4 , the final product.

This acid is made on an immense scale, the reactions taking place in leaden chambers. Sulphur is used most largely in the United States as the source of production, whilst pyrites are used almost exclusively abroad. As the latter nearly always contain arsenical compounds, the foreign commercial product is contaminated with them.

Acidum Sulphuricum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless liquid, of an oily consistence. Sp. gr. not below 1.835.	Inodorous; strongly caustic and corrosive; strongly acid reaction.	In water and alcohol in all proportions, with evolution of so much heat that the mixing requires great caution.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>It boils at 338° C. (640.4° F.). When heated on platinum foil, it is vaporized without leaving a residue. If the Acid be dropped upon sugar or wood, it blackens them; if diluted with 5 volumes of water, the liquid yields, with barium chloride T.S., a white precipitate insoluble in hydrochloric acid.</p> <p>To neutralize 0.489 Gm. of Sulphuric Acid, diluted with about 10 C.c. of water, should require not less than 9.25 C.c. of normal potassium hydrate V.S. (each 0.1 C.c. corresponding to 1 per cent. of the absolute acid), phenolphthalein being used as indicator.</p>	Lead.	On pouring the Acid into 4 or 5 volumes of alcohol, no precipitate should be formed within one hour.
	Nitric or Nitrous Acid.	If there be carefully poured upon Sulphuric Acid, in a test-tube, a layer of ferrous sulphate T.S., no brownish or reddish zone should appear at the line of contact of the two liquids.
	Hydrochloric Acid.	When diluted with 20 volumes of water, no precipitate should be formed by the addition of silver nitrate T.S.
	Lead, Arsenic, Copper.	When diluted with 20 volumes of water, no precipitate should be formed by the addition of hydrogen sulphide T.S.
	Iron.	When diluted with 20 volumes of water, no precipitate should be formed by the addition of an excess of ammonia water.
	Arsenic.	If 1 C.c. of a mixture of 1 volume of the Acid with 2 volumes of water be mixed with 1 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), and a small piece of pure tin-foil added, no coloration should appear within one hour.
	Non-volatile Impurities.	When diluted with 20 volumes of water containing excess of ammonia water, no fixed residue should be left on evaporation and gentle ignition.
	Iron, Thallium, etc.	Nor should the Acid thus supersaturated yield any precipitate on addition of ammonium sulphide T.S.
	Sulphurous or Nitrous Acid.	When considerably diluted and treated with test-zinc, it evolves a gas which should not blacken paper moistened with test-solution of nitrate of silver.
		If 1 C.c. of the Acid be diluted with 5 C.c. of water and cooled, the solution should not at once discharge the color of 0.1 C.c. of decinormal potassium permanganate V.S.

Uses.—Sulphuric acid is the most powerful of the official inorganic acids. It is employed in making many preparations, mostly on account of its energetic action in decomposing salts, and the large use made of its compounds with metals, alkaloids, and other bodies. It is rarely used in the pure state as an escharotic, owing to its tendency to spread. When accidentally dropped upon the skin, a quick and profuse application of magnesia will prove effective. Unless the quantity of acid is very small, care should be used in applying water, except when a very large quantity can be applied at once, as the amount of heat produced when water is mixed with sulphuric acid would increase the pain. Internally, sulphuric acid is administered either in its diluted form or as aromatic sulphuric acid.

ACIDUM SULPHURICUM AROMATICUM. U. S. Aromatic Sulphuric Acid.

	Metric.	Old form.
Sulphuric Acid	100 C.c.	8 fl. oz. 96 min.
Tincture of Ginger	50 C.c.	1 fl. oz. 288 min.
Oil of Cinnamon	1 C.c.	15 minims.
Alcohol, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Add the Sulphuric Acid gradually, and with great caution, to 700 C.c. [old form 22½ fl. oz.] of Alcohol, and allow the mixture to cool. Then add to it the Tincture of Ginger and the Oil of Cinnamon, and afterwards enough Alcohol to make the whole measure 1000 C.c. [old form 2 pints]. Keep the product in glass-stoppered bottles.

If 4.89 Gm. of Aromatic Sulphuric Acid be mixed, in a small flask, with 15 C.c. of water and boiled for several minutes (so as to decompose the ethyl-sulphuric acid), and the liquid be then allowed to cool, it should require, for complete neutralization, about 18.5 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of absolute or about 1.08 per cent. of official Sulphuric Acid), phenolphthalein being used as indicator. Aromatic Sulphuric Acid contains about 20 per cent., by weight, of official sulphuric acid, partly in form of ethyl-sulphuric acid; the specific gravity is about 0.939.

Uses.—This preparation, known as *elixir of vitriol*, and largely used, is employed principally as a remedy in the night-sweats of phthisis. It is used somewhat as an excipient for quinine pills, to reduce their size and render them more soluble. The introduction of the acid sulphate of quinine has diminished this use. Its employment in the preparation of infusion of cinchona is to aid in the extraction of the alkaloids. The dose is from 10 to 30 minims (0.6 to 1.9 C.c.).

ACIDUM SULPHURICUM DILUTUM. U.S. Diluted Sulphuric Acid.

	Metric.	Old form.
Sulphuric Acid	100 Gm.	1 fl. oz.
Distilled Water	825 Gm.	15 fl. oz.
To make	925 Gm.	16 fl. oz.

Pour the Acid gradually, under constant stirring, into the Distilled Water. Keep the product in glass-stoppered bottles. Diluted Sulphuric Acid contains 10 per cent., by weight, of absolute Sulphuric Acid, and has the specific gravity of about 1.070. To neutralize 4.89 Gm. of Diluted Sulphuric Acid should require 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the absolute acid), phenolphthalein being used as an indicator.

The strong acid is added gradually to the water, to guard against the too sudden production of heat, which might cause the fracture of a glass vessel. During the dilution, when commercial sulphuric acid is used, the liquid becomes slightly turbid, and in the course of a few days deposits a grayish-white powder, which is lead sulphate, and from which the diluted acid should be poured off.

The formation of this precipitate does not occur if official or chemically pure sulphuric acid is used. The lead salt is present only in sulphuric acid which has not been purified.

Uses.—Diluted sulphuric acid has the same properties as the acid from which it is made, except those which are dependent upon the strength of the latter. It is given internally, properly diluted, in doses of ten to twenty minims (0.6 to 1.2 C.c.).

ACIDUM SULPHUROSUM. U.S. Sulphurous Acid.

A liquid composed of not less than 6.4 per cent., by weight, of Sulphurous Acid Gas [Sulphur Dioxide, $\text{SO}_2 = 63.9$], and not more than 98.6 per cent. of water.

	Metric.	Old form.
Sulphuric Acid	80 C.c.	2 fl. oz. 269 min.
Charcoal, in coarse powder	20 Gm.	292 grains.
Distilled Water	1000 C.c.	2 pints.

Introduce the Charcoal into a glass flask having a capacity of about 500 C.c. [old form 1 pint], add the Acid, and mix them well. By means of a glass tube and well-fitting corks, connect the flask with a wash-bottle of the capacity of about 200 C.c. [old form $6\frac{1}{2}$ fl. oz.], which is one-third filled with water and fitted with a cork having three perforations. Into one of these perforations insert a safety-tube, which should reach nearly to the bottom of the bottle; into the remaining perforation fit a glass tube, and connect it with a bottle having a capacity of about 1500 C.c. [old form 3 pints] and containing 1000 C.c. [old form 2 pints] of Distilled Water deprived of air by being boiled shortly before use. The tube should dip about twenty-five millimeters below the surface of the Distilled Water. By means of a second tube connect this bottle with another containing a dilute solution of sodium carbonate, to absorb any gas which may not be retained by the Distilled Water. Having ascertained that all the connections are air-tight, apply a moderate heat to the flask containing the Sulphuric Acid and Charcoal, until the evolution of gas has nearly ceased, and, during the passage of the gas, keep the bottle containing the Distilled Water at or below 10°C. (50°F.), by surrounding it with cold water or ice. Finally pour the Sulphurous Acid into dark amber-colored, glass-stoppered bottles, and keep them in a cool place, protected from light.

The reactions which take place are simple. When the sulphuric acid (H_2SO_4) and charcoal are heated together, two molecules of the former each give up an atom of oxygen to the latter, and there are thus produced sulphurous and carbonic acid gases, which, having been first passed through a wash-bottle containing a little water to absorb impurities, are received into the distilled water, where the sulphurous acid is absorbed, whilst the greater part of the carbonic acid gas escapes.

The mounted flask figured on page 149 is well adapted for preparing sulphurous acid (the thermometer may be omitted). The wash-bottle illustrated upon page 206 can be used in lieu of the bottle directed in the official formula: as the generation of the gas progresses, the liquid in the wash-bottle accumulates. Care must be observed in making sulphurous acid to disconnect the wash-bottle from the tube leading to the flask the instant the gas ceases to come over, otherwise a portion of the liquid in the wash-bottle will be sucked into the flask by the partial vacuum produced, almost certainly involving fracture of the flask.

Acidum Sulphurosum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless liquid, of sp. gr. not less than 1.035.	Characteristic odor of burning sulphur; very acid sulphurous taste; strongly acid reaction.	Miscible, in all proportions, with water and alcohol.
TEST FOR IDENTITY AND QUANTITATIVE TEST.		IMPURITIES. TEST FOR IMPURITIES.
<p>By heat it is completely volatilized. Litmus paper brought in contact with the Acid is at first turned red, and afterward bleached. On gently heating a few C.c. of the Acid in a test-tube, the gas evolved will blacken a strip of paper moistened with mercurous nitrate T.S., but will not affect one moistened with lead acetate T. S. On pouring 1 C.c. of Sulphurous Acid into a test-tube containing 5 C.c. of diluted hydrochloric acid and adding a small piece of pure zinc, hydrogen sulphide gas is evolved, which blackens paper wet with lead acetate T.S.</p> <p>If 2 Gm. of Sulphurous Acid be diluted with 25 C.c. of distilled water and a little starch T.S. be added, at least 40 C.c. of decinormal iodine V.S. should be required, before a permanent blue tint is developed (each C.c. corresponding to 0.16 per cent. of Sulphur Dioxide).</p>		<p>Limit of Sulphuric Acid. { If to 10 C.c. of Sulphurous Acid there be added 1 C.c. of diluted hydrochloric acid, followed by 1 C.c. of barium chloride T.S., not more than a very slight turbidity should be produced.</p>

The official quantitative test depends for its action upon the decomposition of a quantity of iodine proportionate to the amount of sulphurous acid present in the sample tested. The iodine is converted into hydriodic acid, which is colorless, whilst the sulphurous acid becomes sulphuric acid: thus, $\text{H}_2\text{SO}_3 + \text{I}_2 + \text{H}_2\text{O} = 2\text{HI} + \text{H}_2\text{SO}_4$. The gelatinized starch is used simply to show, by the blue color which it assumes, when free iodine is present: this takes place when all the sulphurous acid has been decomposed.

Uses.—Sulphurous acid is principally used to prevent the growth of the microscopic organisms which induce fermentation. Internally, it is rarely administered, its salts, the sulphites, being preferred. The dose is from three minims to one fluidrachm (0.18 to 3.7 C.c.) diluted with water.

ACIDUM PHOSPHORICUM. U.S. Phosphoric Acid.

A liquid composed of not less than 85 per cent., by weight, of absolute Orthophosphoric Acid [$\text{H}_3\text{PO}_4 = 97.8$], and not more than 15 per cent. of water.

The above-mentioned percentage (85) is that assumed for Phosphoric Acid in the formulas of pharmacopœial preparations. Phosphoric Acid should be kept in glass-stoppered bottles.

This concentrated form of phosphoric acid is now of the strength of 85 per cent., instead of 50 per cent., as in the U. S. P. 1880.

The process for making phosphoric acid was abandoned by the U. S. P. 1890 on account of the danger usually attending the operation, and because it can be made much more profitably on the large scale.

A modification of this process, which obviates any likelihood of danger, is as follows: Pour 12 fluidounces of distilled water, mixed

with 11 fluidounces of nitric acid, into a two-pint flask. Add 40 grains of bromine, and shake it gently until it is dissolved. Now add two ounces of phosphorus, and set the flask aside, where the nitrous vapors may be carried off without injury. In winter-time, or if the acid is needed at once, it will be necessary to aid the reaction by a gentle heat; but if sufficient time can be allowed, the phosphorus will disappear gradually at the ordinary temperature, and no particular attention will be needed until the phosphorus is oxidized. The nearly colorless liquid remaining in the flask is then evaporated, tested for impurities by the official method, and diluted to the proper strength.

The most dangerous impurity likely to be found in the finished preparation is arsenic,—its presence being traced to the sulphuric acid made from pyrites, which is used in making the phosphorus.

Acidum Phosphoricum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless liquid, of the specific gravity not below 1.710.	Odorless; strongly acid taste; acid reaction.	Miscible, in all proportions, with water and alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.

When heated, the liquid loses water, and when a temperature of about 200° C. (392° F.) has been reached, the Acid is gradually converted into pyrophosphoric and metaphosphoric acids, which may be volatilized in dense fumes at a red heat, or forms on cooling a transparent mass of glacial Phosphoric Acid. If the Acid be supersaturated with ammonia water, addition of magnesium sulphate T.S. (or of magnesia mixture) produces a white, crystalline precipitate. If this precipitate be dissolved in diluted acetic acid, the solution yields a yellow precipitate with silver nitrate T.S.

0.978 Gm. of Phosphoric Acid, diluted with water, should require, for neutralization, not less than 17 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 5 per cent. of the absolute acid), phenolphthalein being used as indicator.

IMPURITIES.

TESTS FOR IMPURITIES.

Phosphorous Acid.

If 1 C.c. of Phosphoric Acid be diluted with 5 C.c. of water, and gently warmed, it should not be blackened by silver nitrate T.S., nor be turned white or whitish by mercuric chloride T.S.

Arsenic.

If 1 C.c. of the Acid (in which nitric and Phosphorous acids have previously been shown to be absent) be mixed with 1 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), and a small piece of pure tin-foil added, no coloration should appear within one hour.

Nitric Acid.

If a crystal of ferrous sulphate be dropped into a cooled mixture of 1 C.c. each of Phosphoric and sulphuric acids, no brown or brownish-black color should appear around the crystal.

Phosphate.

Upon adding to 1 C.c. of the Acid a mixture of 3 C.c. of alcohol and 1 C.c. of ether, no turbidity should appear.

Sulphuric Acid.

After diluting Phosphoric Acid with 5 volumes of distilled water, no precipitate should be produced on the addition of small portions of barium chloride T.S.

Iron.

After neutralizing a portion of the Acid with ammonia water, the addition of ammonium sulphide T.S. should produce neither a color nor a precipitate. The diluted acid should yield no precipitate with silver nitrate T.S.

Hydrochloric Acid.

Nor should any precipitate be formed, after several hours, by the addition of an equal volume of tincture of ferric chloride.

Pyrophosphoric and Metaphosphoric Acids.

Uses.—Phosphoric acid, sometimes called “syrupy phosphoric acid,” is used almost solely to make the diluted phosphoric acid.

ACIDUM PHOSPHORICUM DILUTUM. U. S. Diluted Phosphoric Acid.

	Metric.	Old form.
Phosphoric Acid	100 Gm.	1½ fl. oz.
Distilled Water	750 Gm.	16 fl. oz.
To make	850 Gm.	17¼ fl. oz.

Mix them. Keep the product in well-stoppered bottles.

Diluted Phosphoric Acid has a specific gravity of 1.057, and contains 10 per cent. by weight of orthophosphoric acid. It should respond to the tests of purity required for Phosphoric Acid. 4.89 Gm. of Diluted Phosphoric Acid should require for neutralization 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the absolute acid), phenolphthalein being used as indicator.

The precipitation which sometimes occurs when this acid is mixed with tincture of ferric chloride is generally due to the presence of pyrophosphoric acid. Ferric pyrophosphate is precipitated in the form of an insoluble gelatinous precipitate.

Uses.—Diluted phosphoric acid is tonic and refrigerant in doses of twenty minims (1.2 C.c.).

ACIDUM HYPOPHOSPHOROSUM DILUTUM. U. S. Diluted Hypophosphorous Acid.

A liquid composed of about 10 per cent., by weight, of absolute Hypophosphorous Acid [$\text{H}_3\text{P}_2\text{O}_5$, = 65.88] and about 90 per cent. of water. Specific gravity: about 1.046 at 15° C. (59° F.).

Diluted hypophosphorous acid may be made in various ways, but the process of the National Formulary (see Part VI.), which consists of decomposing potassium hypophosphite with tartaric acid, is practical. The trace of acid potassium tartrate left in the solution is insufficient to be considered objectionable when used medicinally.

Acidum Hypophosphorosum Dilutum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITIES.	
		Water.	Alcohol.
A colorless liquid. When heated in a porcelain capsule, it evaporates, losing at first principally water and becoming more concentrated. On further heating it decomposes, forming hydrogen phosphide, which ignites, and phosphoric acid. The pasty residue finally reddens, ignites, and the last portions of phosphorus burn out at higher heat. Sp. gr. 1.046.	Odorless; acid reaction.	In all proportions.	In all proportions.
TESTS FOR IDENTITY AND QUALITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.	
From silver nitrate T.S. it reduces black metallic silver. When the Acid is gently heated with copper sulphate T.S., a yellow precipitate of copper hydride falls, which rapidly assumes a reddish-brown color.	Lead. Iron.	The addition of hydrogen sulphide T.S. to the Acid should produce neither a precipitate nor a coloration. If some of the Acid be neutralized with ammonia water, separate portions of the liquid should not yield a precipitate with ammonium sulphide T.S.	

TESTS FOR IDENTITY AND QUALITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If 0.5 Gm. of the Diluted Hypophosphorous Acid be mixed with 7 C.c. of sulphuric acid and 35 C.c. of decinormal potassium permanganate V.S., and the mixture boiled for fifteen minutes, it should require about 4.7 C.c. of decinormal oxalic acid V.S. to discharge the red color, corresponding to about 10 per cent. of absolute Hypophosphorous Acid.</p> <p>To neutralize 6.6 Gm. of Diluted Hypophosphorous Acid should require about 10 C.c. of normal potassium hydrate V.S. (each C.c. corresponding to 1 per cent. of the absolute acid), phenolphthalein being used as an indicator.</p>	<p>Calcium.</p> <p>Phosphoric, Sulphuric, Oxalic, and Tartaric Acids.</p> <p>Potassium.</p>	<p>If some of the Acid be neutralized with ammonia water, separate portions of the liquid should not yield a precipitate with ammonium oxalate T.S.</p> <p>If some of the Acid be neutralized with ammonia water, separate portions of the liquid should not yield a slight turbidity with barium chloride T.S.</p> <p>Neither platinum chloride T.S. nor sodium cobaltic nitrite T.S. should produce more than a slight yellow turbidity in the diluted Acid.</p>

Uses.—This acid was introduced into the U. S. P. 1890 solely for the purpose of acting as a reducing agent, when added to solutions of various iodides which are liable to be decomposed by the action of light and air. (See Syrupus Acidi Hydriodici, Liquor Ferri Iodidi, N. F.)

QUESTIONS ON CHAPTERS XXXII. AND XXXIII.

HYDROGEN, OXYGEN, WATER, AND INORGANIC ACIDS.

What are the atomic weights of hydrogen? Of oxygen? Of water?

Give a description of hydrogen. Of oxygen.

What percentage of oxygen by weight does water contain?

What is the formula in symbols of water? How may metallic impurities be detected?

If the transparency or color of distilled water is affected by any of the following tests, what impurity is indicated?—viz.: Hydro-sulphuric acid or ammonium sulphide; test solution of barium chloride; test solution of silver nitrate; test solution of ammonium oxalate; test solution of mercuric chloride, with or without the subsequent addition of potassium carbonate.

What are the uses of distilled water in pharmacy?

What is the Latin official name of solution of hydrogen dioxide?

When freshly prepared, how much pure hydrogen dioxide does it contain?

To what amount of available oxygen does this correspond?

How is it prepared?

How are acids distinguished from other bodies?

What do the suffixes "ous" and "ic" designate when applied to acids?

How may glass stoppers be removed without injury from bottles in which they have become tightly fastened?

Why should corks not be used as stoppers for strong acids?

How may carboys containing strong acids be handled conveniently and safely?

What grades of acid are found in commerce?

What injurious results may follow the use of weak and impure acids?

Are the official inorganic acids uniform in strength?

What is the strength of hydrochloric acid? Of nitric acid? Of sulphuric acid?

- Are the diluted acids uniform in strength?
 What per cent. of absolute acid do they contain?
 What are the medical properties of the inorganic acids?
 How may their injurious action on the teeth be avoided?
 What are the proper antidotes for strong acids which may have been taken in poisonous doses?
 Give the formula in symbols and molecular weight of hydrochloric acid.
 What is official hydrochloric acid? How is it made?
 Explain the reaction which takes place in its manufacture.
 For what purposes in pharmacy is hydrochloric acid used?
 To what is the yellow color of the common acid usually due?
 What is the cause of the white fumes which are produced when the acid is exposed to the air?
 What are tests for the following impurities?—viz.: Iron or much lead; copper; lead and iron; non-volatile metals; chlorine; sulphuric acid; sulphurous or arsenous acid.
 What is the specific gravity of hydrochloric acid?
 Give the formula for diluted hydrochloric acid
 How much absolute hydrochloric acid does it contain?
 What is the official test of its strength? What are its uses?
 What is the composition of diluted hydrobromic acid?
 Give the formula in symbols and molecular weight of diluted hydrobromic acid.
 How is diluted hydrobromic acid usually made? Describe the distillation process.
 Explain the chemical reaction. Describe the precipitation process.
 What chemical reaction takes place in this process?
 What is the specific gravity of diluted hydrobromic acid?
 How may free bromine be detected? How may sulphuric acid be detected?
 For what is diluted hydrobromic acid used, and what is the dose?
 Give the symbol and molecular weight of absolute nitric acid.
 How much is contained in official nitric acid?
 What five compounds are there of nitrogen and oxygen?
 From which of these is nitric acid formed, and how?
 How is nitric acid prepared commercially?
 If two molecules of the sodium salt and one of sulphuric be used, what will be the reaction? Upon raising the heat, what further reaction takes place?
 What is the specific gravity of the official acid? Of the commercial acid?
 What is the composition of the reddish acid called nitrous acid?
 What are tests for the following impurities?—viz.: Iron or much lead; copper; lead and iron; non-volatile metals; sulphuric acid; hydrochloric acid; arsenic acid; free iodine; iodic acid.
 For what is nitric acid used in pharmaceutical operations?
 Explain the decomposition which takes place when nitric acid is exposed to a red heat. What acids are produced by its action on phosphorus and sulphur?
 What does it form in combination with salifiable bases?
 What are its medicinal properties?
 To what is the yellow stain due when nitric acid is applied to the skin?
 Give the formula for diluted nitric acid. How much real nitric acid does it contain?
 What is its specific gravity? What is the official test of its strength?
 What is its medicinal use and dose?
 Give the formula for nitrohydrochloric acid.
 What reaction takes place when nitric acid is mixed with hydrochloric acid?
 What is the liquid thus formed popularly called?
 Upon what does the value of this acid depend?
 Why should it be kept in a cool and dark place? Describe its physical properties.
 What is its medicinal use? What is the dose?
 Why is especial care necessary in dispensing this acid?
 Give the formula for diluted nitrohydrochloric acid.
 Should the ingredients be all mixed together at once? Why?
 Describe its physical properties. What are its medicinal uses and dose?
 Give the symbol and molecular weight of absolute sulphuric acid.
 How much does the official sulphuric acid contain?
 How is sulphuric acid obtained?
 Explain the reactions that take place in the process.
 What is the principal source of production of sulphuric acid in America? What in Europe? What is the foreign commercial article apt to be contaminated with?

- What is the specific gravity of the official acid?
- What are the tests for the following impurities?—viz. : Lead; nitric acid; hydrochloric acid; copper, iron; non-volatile metals; arsenous or sulphurous acid.
- What are its uses?
- How is it administered internally?
- Give the formula for aromatic sulphuric acid.
- How much official sulphuric acid does it contain?
- What is its specific gravity? What is its popular name?
- What are its uses? What is the dose?
- Give the formula for diluted sulphuric acid.
- How much official sulphuric acid does it contain?
- What is its specific gravity?
- When commercial sulphuric acid is diluted, what precipitate is thrown down, and why?
- What are the uses of sulphuric acid? What is the dose?
- Give the formula in symbols and molecular weight of sulphurous acid gas?
- How much of this does the official sulphurous acid contain?
- How is the official acid prepared?
- Explain the reaction which takes place in its production.
- What is its specific gravity?
- How may excess of sulphuric acid be detected?
- What are its uses? Give the dose.
- What is official phosphoric acid?
- Give the formula in symbols and molecular weight of orthophosphoric acid.
- How may the official acid be prepared?
- Explain the rationale of the reaction which takes place.
- What dangerous impurity is likely to be present? Where does it come from?
- What is the specific gravity of the official acid?
- What is its principal use?
- How may the following impurities be detected?—viz. : Phosphorous acid; arsenic acid; nitric acid; sulphuric acid; hydrochloric acid; pyrophosphoric and metaphosphoric acids.
- How is diluted phosphoric acid made?
- How much orthophosphoric acid does it contain?
- What is its specific gravity?
- If a precipitate occurs when this acid is mixed with tincture of ferric chloride, what is indicated?
- What are its uses and doses?
- What is the Latin official name of diluted hypophosphorous acid?
- How much absolute hypophosphorous acid does it contain?
- Give the formula in symbols and the molecular weight of hypophosphorous acid.

CHAPTER XXXIV.

PREPARATIONS OF THE HALOGENS.

Chlorine, Bromine, and Iodine.

Cl; 35.37. Br; 79.76. I; 126.53.

FOUR elements, *chlorine*, *bromine*, *iodine*, and *fluorine*, are termed halogens (salt-producers). Fluorine is of so little interest in pharmacy that it will not be noticed: the other three are of great interest both to medicine and to pharmacy.

Chlorine. Cl; 35.37.

Chlorine is a greenish-yellow, gaseous body, having a very suffocating odor; its specific gravity is 2.45 (when liquefied 1.33). Its most useful and characteristic property is that of bleaching organic coloring principles: the presence of water is necessary to effect this object. Chlorine is one of the most reliable disinfectants: it is principally used in combination with lime as bleaching powder, the official name being *Calx Chlorata*.

Chlorine combines with hydrogen and the metals, but has very little attraction for oxygen; its principal hydrogen compound is hydrochloric acid, HCl (see *Acidum Hydrochloricum*). The compounds of chlorine with metals and bases are termed chlorides: they will be considered under the heads of their respective bases.

Chlorine combines indirectly with oxygen, and the compounds produced by the union of the oxyacid, chloric acid, HClO_3 , with metals or bases are termed chlorates. Perchlorates are also known.

Tests for Chlorides and Chlorates.

Chlorides in solution, or hydrochloric acid, may be recognized by the addition of a solution of silver nitrate; a curdy white precipitate is produced, which is soluble in ammonia water, but insoluble in nitric acid.

Chlorates are recognized by the evolution of oxygen when heated, and by the reaction of the residue corresponding with that of chlorides.

Official Preparations of Chlorine, Bromine, and Iodine.

Chlorine.—Made by the action of heat upon hydrochloric acid and manganese dioxide.
Aqua Chlori.—An aqueous solution of chlorine containing 0.4 p.c. of the gas.

Chlorine loosely combined.

Calx Chlorata.—Made by subjecting calcium hydrate to the action of chlorine.
Liquor Sodæ Chloratæ.—Made by decomposing solution of chlorinated lime with sodium carbonate.

Bromum (Bromine).—Made by decomposing crude magnesium bromide with chlorine.

Iodum (Iodine).—Made by decomposing crude sodium iodide with manganese dioxide and sulphuric acid and subliming.

Tinctura Iodi.—A 7 p.c. alcoholic solution of iodine.

Liquor Iodi Compositus—A 5 p.c. aqueous solution of iodine, made soluble by the addition of 10 p.c. of potassium iodide.

Unguentum Iodi.—4 p.c. iodine; 1 p.c. potassium iodide; 2 p.c. water, with benzoated lard.

Iodine loosely combined.

Syrupus Acidi Hydriodici.—1 p.c. syrupy solution of hydriodic acid.

Unofficial Preparations of Chlorine, Bromine, and Iodine.

Acidum Hypochlorosum, HClO .
Hypochlorous Acid.

Agitate chlorine water with precipitated mercuric oxide. Distil the liquid to remove mercuric chloride, and collect the distillate.

Acidum Chloricum, HClO_2 .
Chloric Acid.

Decompose barium chlorate with an equivalent amount of pure diluted sulphuric acid; pour off the clear solution of chloric acid, and evaporate carefully *in vacuo* over strong sulphuric acid.

Acidum Perchloricum, HClO_4 .
Perchloric Acid.

Distil pure dry potassium perchlorate with four times its weight of concentrated (previously boiled) sulphuric acid. Collect the yellow distillate.

Bromi Chloridum.
Bromine Chloride.

Pass chlorine gas over bromine.

Acidum Bromicum.
Bromic Acid.

Decompose barium bromate with an equivalent amount of diluted sulphuric acid, filter, and evaporate.

Acidum Hydriodicum, HI .
Hydriodic Acid.

See **Syrupus Acidi Hydriodici**, U. S. P., p. 300.

Acidum Iodicum, HIO_3 .
Iodic Acid.

Heat 1 p. iodine with 10 p. nitric acid in a retort until the iodine is dissolved and fumes cease to be evolved. Evaporate the solution, and heat the residue to 200°F . until all trace of acid is removed. Collect the white powder.

Acidum Periodicum, HIO_4 .
Periodic Acid.

Add 1 p. iodine to a solution of 7 p. sodium carbonate in 100 p. water, and pass chlorine into the heated liquid until a precipitate ceases to form. Dissolve this precipitate in pure nitric acid, then add silver nitrate, and dissolve the resulting precipitate in hot diluted nitric acid. Then concentrate to crystallize. Treat the crystals with water, filter, and evaporate.

Amylum Iodatum.
Iodized Starch.

5 p.c. iodine moistened with water and triturated with starch. It has been asserted by Bondonneau, Payen, Fritzsche, and others that iodine forms with starch a definite compound, and the formulas $(\text{C}_6\text{H}_{10}\text{O}_5)_3\text{I}$ and $(\text{C}_6\text{H}_{10}\text{O}_5)_{10}\text{I}$ have been assigned to it. The existence of these compounds is regarded as doubtful, however, and the U. S. P. 1880 terms the mixture iodized starch. Iodized starch is a convenient preparation for administering iodine internally, the principal advantage being that starch forms an admirable diluent and the iodine is freed from irritant properties. The dose is two to four drachms (7.7 to 15.5 Gm.).

- Chlorine in its free state is used officially in aqua chlori, or chlorine water (see page 288).

AQUA CHLORI. U. S. Chlorine Water.

Chlorine water is made by heating hydrochloric acid with manganese dioxide, and conducting the generated chlorine into distilled water until a saturated solution is produced: it should contain at least 0.4 per cent. of the gas (see page 288).

The chlorine water must be kept secluded from the light, to prevent its partial conversion into hydrochloric acid through the decomposition of the water by the union of the chlorine with its hydrogen.

Aqua Chlori. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
A greenish-yellow, clear liquid, having the suffocating odor and disagreeable taste of Chlorine, and leaving no residue on evaporation. It instantly decolorizes dilute solutions of litmus, indigo, and other vegetable coloring matters.	Corresponding to at least 0.4 per cent. of Chlorine. Hydrochloric Acid.	On mixing 17.7 Gm. of Chlorine Water with a solution of 1 Gm. of potassium iodide in 10 C.c. of water, the resulting deep-red liquid should require for complete decoloration at least 20 C.c. of decinormal sodium hyposulphite V.S. When Chlorine Water is shaken with an excess of mercury until the odor of Chlorine has disappeared, the remaining liquid should be at most but faintly acid.

The little apparatus shown in Fig. 225 is well adapted for making small quantities of chlorine water rapidly. Chlorine water is sometimes made extemporaneously by placing three fluidrachms of hydrochloric acid in a pint bottle, adding forty grains of potassium chlorate, and when the bottle is nearly filled with chlorine vapor, adding one fluidounce of distilled water. The bottle should now be stoppered, and, when the crystals have dissolved, sufficient distilled water is added to make one pint. This method is not to be compared in efficiency with the official process. The liquid contains free hydrochloric acid and potassium chloride; the explosive gas Cl_2O_4 is generated also, but not in sufficient quantity to be dangerous if the above directions are carefully carried out.

Uses.—Chlorine water is antiseptic and stimulant: it is used as a gargle in scarlet fever, diphtheria, and similar diseases. Chlorine in the gaseous state is largely used as a disinfectant. A convenient way of generating it is by the well-known *chlorine saucer disinfectant*: this is made by pouring half a fluidounce of equal measures of sulphuric acid and water upon two hundred grains of a finely-ground mixture of equal parts of black manganese oxide and common salt, contained in a saucer. Chlorine is gradually evolved from this mixture for several days. Chlorinated lime and solution of chlorinated soda both owe their properties to the presence of chlorine. They will therefore be considered here.

CALX CHLORATA. U. S. Chlorinated Lime.

“A compound resulting from the action of Chlorine upon Calcium Hydrate, and containing not less than 35 per cent. of available Chlorine.”

Preparation.—Chlorinated lime—or chloride of lime, as it is more frequently and less properly called—is made by exposing finely-powdered calcium hydrate, which is placed on trays in a suitable chamber, to the action of chlorine. The gas is absorbed by the lime, and a

chemical compound is formed, which is represented by the formula CaOCl_2 . Various views have been held by chemists as to its exact composition, but the weight of opinion is now in favor of considering it to be as above stated, and yielding, by decomposition with water, calcium hypochlorite and calcium chloride. The value of chlorinated lime, whether used for bleaching purposes or in medicine, depends upon the amount of chlorine which can be eliminated; for, whatever view is accepted as to its composition, it is admitted that the chlorine is very loosely combined.

Calc. Chlorate. U. S.	TESTS.
A white, or grayish-white, granular powder, or friable lumps, becoming moist and gradually decomposing on exposure to air, having a hypochlorous acid odor and a disagreeable, saline taste. It is partially soluble in water and in alcohol. On dissolving Chlorinated Lime in diluted acetic acid, chlorine gas is given off, and a trifling residue left undissolved.	Its solution in diluted acetic acid yields, with ammonium oxalate, a white precipitate insoluble in acetic acid but soluble in hydrochloric acid. The aqueous solution first colors red litmus paper blue, and then bleaches it. If 0.35 (0.354) Gm. of Chlorinated Lime be thoroughly triturated with 50 C.c. of water and carefully transferred, together with the washings, into a flask, and then 0.8 Gm. of potassium iodide and 5 C.c. of diluted hydrochloric acid added, the reddish-brown liquid, mixed, towards the end of the titration, with a few drops of starch T.S., should require, for complete decoloration, not less than 35 C.c. of decinormal sodium hyposulphite V.S. (each C.c. corresponding to 1 per cent. of available chlorine).

Chlorinated Lime should be preserved in well-closed vessels in a cool or dry place. A very excellent method of preservation is now in vogue, in which the dry chlorinated lime is hermetically sealed in straw-board boxes, which are protected on the inside by a composition coating containing rosin. When exposed to the air it soon becomes moist, on account of the hygroscopic character of the calcium chloride present.

Uses.—Chlorinated lime is used in the preparation of solution of chlorinated soda, but most largely as a disinfectant, through its power of arresting animal and vegetable putrefaction. It is rarely given internally, but is sometimes used as a stimulant and alterative, in doses of three to six grains. Externally, it is used in solution as an application to ulcers, burns, etc.

LIQUOR SODÆ CHLORATÆ. U. S. Solution of Chlorinated Soda.

[LABARRAQUE'S SOLUTION.]

An aqueous solution of several chlorine-compounds of sodium, containing at least 26 per cent., by weight, of available chlorine.

	Metric.	Old form.
Sodium Carbonate	150 Gm.	21 oz. av.
Chlorinated Lime	75 Gm.	10½ oz. av.
Water, a sufficient quantity,		
To make	1000 Gm.	8 pints.

Triturate the Chlorinated Lime with 200 C.c. [old form 25½ fl. oz.] of Water, gradually added, until a uniform mixture results. Allow

the heavier particles to subside, and transfer the thinner, supernatant portion to a filter. Then triturate the residue again with 200 C.c. [old form 25½ fl. oz.] of Water, transfer the whole to the filter, and, when the liquid has drained off, wash the filter and contents with 100 C.c. [old form 13 fl. oz.] of Water. Dissolve the Sodium Carbonate in 300 C.c. [old form 38 fl. oz.] of hot Water, and add this solution to the previously obtained filtrate contained in a suitable vessel. Stir or shake the mixture thoroughly, and, if it should become gelatinous, warm the vessel until the contents liquefy. Then transfer the mixture to a new filter, and, when no more liquid drains from it, wash the filter and contents with enough Water to make the product weigh 1000 Gm. [or measure, old form, 8 pints].

Keep the Solution in well-stoppered bottles, protected from light.

Double decomposition results in the formation of insoluble calcium carbonate or precipitated chalk, whilst sodium hypochlorite and sodium chloride remain in solution.

Liquor Sodæ Chloratæ. U.S.	Tests.
A clear, pale greenish liquid, of a faint odor of chlorine, a disagreeable and alkaline taste, and an alkaline reaction. Sp. gr. about 1.052 at 15° C. (59° F.). Addition of hydrochloric acid causes an effervescence of chlorine and carbonic acid gas. The solution at first colors red litmus paper blue and then bleaches it.	If 6.7 (6.74) Gm. of the Solution be mixed with 50 C.c. of water, then 2 Gm. of potassium iodide and 10 C.c. of hydrochloric acid added, together with a few drops of starch T.S., it should require not less than 50 C.c. of decinormal sodium hypopulphite V.S. to discharge the blue or greenish tint of the liquid (each C.c. of the volumetric solution corresponding to 0.052 per cent. of available chlorine).

Uses.—Solution of chlorinated soda is principally employed as a disinfectant or bleaching solution: it is frequently termed *Labarraque's Solution*, and is sometimes substituted for *Eau de Javelle* (*Javelle's water*), a French preparation made with potassium carbonate instead of sodium carbonate.

BROMUM. U.S. Bromine.

Br; 79.76.

Preparation.—This non-metallic element, which is in the form of a dark red, volatile liquid, is produced largely in the United States, in Ohio, West Virginia, and Pennsylvania. It is prepared from the brine obtained from salt-wells by the following process. The brine is concentrated to separate chlorides, sulphates, etc., by crystallization. The mother-liquor, containing the bromine principally in the form of magnesium bromide, is decomposed by treating it with chlorine gas produced from manganese dioxide and hydrochloric acid.

The manner of conducting this process is peculiar. The original

salt-liquor, or brine, is pumped out of the ground and evaporated to about 15° B. in large iron pans, then allowed to settle, and is further evaporated in wooden tanks heated by steam pipes to the point of crystallization. These tanks, five in number, are placed at different elevations, one above the other. Each day the liquor is run off from No. 1, the highest, to No. 2, next day to No. 3, and so on until it reaches No. 5, the crystallized salt being removed from each tank after draining off the liquor. The brine which reaches No. 5 is bittern, and consists chiefly of calcium, magnesium, sodium, and aluminum chlorides, with varying percentages of sodium and calcium bromides.

The bittern marking 30° to 38° B. is evaporated to about 45° B. The liquor is then run into stone stills, materials for generation of chlorine added, and heat applied by means of steam until the bromine has all been vaporized. It is condensed and collected in cooled receivers.

On account of its very caustic and irritating properties, *great care* must be used in handling bromine. Its vapor is very corrosive and suffocating.

Chemically, there is a close analogy between bromine and chlorine. Its combination with hydrogen is hydrobromic acid, which is official (see page 448).

The salts, termed bromides, are used very largely in medicine. They will be considered under the heads of their respective bases. *Bromates*, formed, like chlorates, by combination with the corresponding oxyacid, bromic acid, HBrO_3 , are rarely used.

Tests.

1. If a solution of a bromide be treated with a solution of silver nitrate, a yellowish-white precipitate of silver bromide is produced, which is insoluble in nitric acid and but slightly soluble in ammonia water.

2. If chlorine water be added to a strong solution of a bromide, bromine is liberated. This may be dissolved by agitation with carbon disulphide or ether.

3. If concentrated sulphuric acid be added to a bromide (not in solution), reddish vapors of bromine are evolved.

Bromum. U. S.	Odor.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, dark brownish-red, mobile liquid, evolving, even at the ordinary temperature, a yellowish-red vapor, highly irritating to the eyes and lungs. Sp. gr. 2.990 at 15° C. (59° F.).	A peculiar suffocating odor, resembling that of chlorine.	30 parts at 15° C. (59° F.).	Very soluble, with gradual decomposition of the alcohol.	Very soluble in ether, with gradual decomposition of the ether; very soluble in chloroform and in carbon disulphide with a deep reddish - yellow color.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
It is completely volatilized by exposure to air or to heat. It destroys the color of solutions of litmus and indigo, and renders gelatinized starch yellow.	Bromoform or other organic Bromine compounds.	<p>If Bromine be added to an excess of potassium or sodium hydrate T.S., it should combine to form a permanently clear liquid, without the separation of oily drops, or the development of an odor resembling that of chloroform.</p> <p>If 1 C.c. of a saturated aqueous solution of Bromine be diluted with 9 C.c. of water, then mixed with 3 C.c. of ammonium carbonate T.S., and 5 C.c. of decinormal silver nitrate V.S., and the whole actively shaken, the filtered liquid, when supersaturated with nitric acid, should not become more than opalescent, nor separate a flocculent precipitate within three minutes.</p> <p>If an aqueous solution of Bromine be poured upon reduced iron and shaken with the latter until it has become nearly colorless, the filtered liquid, on the addition of a small amount of ferric chloride and of starch T.S., should not assume a blue color.</p>
	More than 3 per cent. of Chlorine.	
	Iodine.	

Uses.—Bromine is rarely used in its undiluted condition. When diluted with water in the proportion of forty minims in a pint, it forms a powerful wash. It is the important ingredient in *Bibron's antidote* to rattlesnake poison, which is made by dissolving three hundred grains of bromine in half a pint of diluted alcohol, and then placing four grains of potassium iodide and two grains of corrosive mercuric chloride in a mortar; sufficient of the solution is added to dissolve the salts, this being mixed with the rest of the solution. The utmost care should be exercised in handling bromine; the vapor not only attacks the eyes and nostrils, but renders the air irrespirable. It acts on metallic surfaces, and may ruin balances if permitted to remain in contact with them.

IODUM. U. S. Iodine.

I; 126.53.

Preparation.—Iodine is a non-metallic element widely distributed in nature. It was formerly exclusively obtained from *kelp*, the ashes of certain sea-weeds. In addition to this source, it is now made from the mother-liquors obtained from the crystallization of sodium nitrate in South America. These contain the iodine in the form of sodium iodide and sodium iodate. The iodides are decomposed by chlorine, iodine being set free, whilst the iodine from the iodates is precipitated by treatment with acid sodium sulphite. The liquid obtained by lixiviating kelp contains the iodine as sodium iodide. A concentrated solution of the impure iodide is treated with sulphuric acid, then distilled with manganese dioxide; the separated iodine condenses in a series of glass receivers.

Iodine of excellent quality is now readily obtained: the presence of a small quantity of water, however, is often noticed.

Iodum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Heavy, bluish-black, dry and friable, rhombic plates of a metallic lustre. Iodine imparts a deep brown, slowly evanescent stain to the skin, and slowly destroys vegetable colors. Specific gravity: 4.948 at 17° C. (62.6° F.).	Distinctive odor; sharp and acrid taste; neutral reaction.	5000 parts.	At 15° C. (59° F.), 10 parts with a brown color.	Very soluble in ether, carbon disulphide, and chloroform, with a violet color, and in a solution of potassium iodide with a brown color.
TESTS FOR IDENTITY, AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.		
It is slowly volatilized at ordinary temperatures. When heated to 114° C. (237.2° F.) it melts, and then rises in purple vapor, being gradually dissipated without leaving a residue. With starch T.S. it produces a dark blue color.	Moisture.	A solution of Iodine in chloroform should be perfectly clear and limpid. Triturate 0.5 Gm. of finely-powdered Iodine with 20 C.c. of water, and filter off the solution. To one-half of this solution, in a test-tube, carefully add decinormal sodium hyposulphite V.S., until the solution is just decolorized. Then add a few drops of ferrous sulphate T.S., and subsequently a little sodium hydrate T.S., and heat the mixture gently. On now adding a slight excess of hydrochloric acid, the liquid should not assume a blue color. To the other half of the aqueous filtrate, in a test-tube, add a slight excess of silver nitrate T.S., shake actively, allow the precipitate to subside, and, having poured off the clear, supernatant liquid completely, shake the precipitate with a mixture of 1 C.c. of ammonia water and 9 C.c. of water, and filter. Upon the addition of a slight excess of nitric acid to the filtrate, not more than a slight opalescence should make its appearance.		
If 0.32 Gm. of Iodine, with 1 Gm. of potassium iodide, be dissolved in 20 C.c. of water, and the solution mixed with a few drops of starch T.S., it should require not less than 25 C.c. of decinormal sodium hyposulphite V.S. to fully decolorize the liquid (corresponding to 98.85 per cent. of pure Iodine).	Iodine Cyanide.			
	Limit of Chlorine or Bromine.			

Iodine is closely related chemically to bromine and chlorine. Its combination with hydrogen (hydriodic acid) is official as Syrupus Acidi Hydriodici, syrup being necessary to preserve it from decomposition. The iodides are largely used in medicine. The iodates, like the chlorates and bromates, are produced by combination with the oxyacids of iodine, iodic and periodic acids. They are of little interest pharmaceutically.

Tests for Iodine and Iodides.

1. A dark blue color (fading upon the application of heat) is produced when iodine is brought in contact with starch mucilage.
2. An iodide is detected by first liberating the iodine by adding a little chlorine water and then using starch mucilage; or if carbon disulphide be added the iodine dissolves in it.
3. Silver nitrate produces with a solution of an iodide a yellowish-white precipitate of silver iodide, which is insoluble in nitric acid and but slightly soluble in ammonia water.
4. A yellow precipitate of lead iodide is produced by adding a solution of lead salt to a neutral solution of an iodide.
5. A red precipitate of mercuric iodide is produced by adding a solution of mercuric chloride to a neutral solution of an iodide.

Uses.—Iodine is very largely used in medicine. It excites the action of the absorbent and glandular systems, and is employed both internally and externally.

TINCTURA IODI. *U. S.* Tincture of Iodine.

A 7 per cent. alcoholic solution of Iodine (see page 369), 6.3 C.c. of the Tincture, mixed with a solution of 2 Gm. of potassium iodide in 25 C.c. of water and a little starch T.S., should require, for complete decoloration, 35 C.c. of the volumetric solution of decinormal sodium hyposulphite (corresponding to about 7 Gm. of iodine in 100 C.c.).

LIQUOR IODI COMPOSITUS. *U. S.* Compound Solution of Iodine.

[LUGOL'S SOLUTION.]

	Metric.	Old form.
Iodine	5 Gm.	$\frac{1}{2}$ oz. av.
Potassium Iodide	10 Gm.	1 oz. av.
Distilled Water, a sufficient quantity,		
To make	100 Gm.	8 $\frac{1}{4}$ fl. oz.

Dissolve the Iodine and Potassium Iodide in a sufficient quantity of Distilled Water to make the product weigh 100 Gm. [or measure, old form, 9 fl. oz.].

Keep the Solution in glass-stoppered bottles.

In this Solution iodine is dissolved in water with the assistance of potassium iodide. Iodine dissolves sparingly in water, but freely in a solution of potassium iodide. In using that salt to render iodine more soluble in water, the iodide is generally employed in a quantity twice the weight of the iodine. The Solution contains about 3.25 grains of iodine in the fluidrachm.

The official quantitative test requires that 12.66 Gm. of the Solution, mixed with a little gelatinized starch, should require, for complete decoloration, 50 C.c. of the volumetric solution of sodium hyposulphite.

Uses.—This Solution affords an efficient means of administering iodine internally. It is given in five-minim (0.3 C.c.) doses, and, to prevent gastric irritation, it must be largely diluted.

UNGUENTUM IODI. *U. S.* Iodine Ointment.

An ointment containing 4 per cent. of Iodine, 1 per cent. of Potassium Iodide, 2 per cent. of Water, and 93 per cent. of Benzoinated Lard. (See Unguenta, Part VI.)

SYRUPUS ACIDI HYDRIODICI. *U. S.* Syrup of Hydriodic Acid.

This is a syrupy liquid containing 1 per cent. of absolute hydriodic acid [HI; 127.53] and having the specific gravity 1.313 (see page 300). It is made by dissolving potassium iodide and potassium hypophosphite in water and decomposing them by adding a solution of tartaric acid in diluted alcohol. Tartaric acid forms with soluble potassium salts acid potassium tartrate (cream of tartar); this is but sparingly soluble

in water, and less so in diluted alcohol, and hence is precipitated out. Hydriodic acid is liberated, and dissolves in the aqueous liquid. A little hypophosphorous acid is also liberated by the action of the tartaric acid on the potassium hypophosphite. The reason for placing the mixture in ice-water is to facilitate the crystallization of the acid potassium tartrate by lowering the temperature. The alcohol is used with the same intention. The object of this preparation is to furnish an agreeable mode of administering hydriodic acid, and also a liquid which will be reasonably stable. *Hydriodic acid*, HI, is easily decomposed in simple aqueous solution, free iodine being liberated, and if taken internally when in this condition, serious results might follow. Syrup of hydriodic acid was formerly made by passing hydrogen sulphide through an alcoholic solution of iodine (see U.S. P. 1880). The chemical reaction which takes place may be expressed as follows:

Uses.—Syrup of hydriodic acid is used as an alterative and antipyretic. The dose is twenty to forty minims (1.2 to 2.4 C.c.).

QUESTIONS ON CHAPTER XXXIV.

PREPARATIONS OF THE HALOGENS.

- What is meant by the term "halogen"?
- What four elements are called "halogens"?
- Describe chlorine. Give its symbol and molecular weight.
- What is its specific gravity?
- What is its most characteristic property?
- What is its principal use, and how is it generally employed?
- What is its principal hydrogen compound?
- What are its compounds with metals and bases termed?
- When combined with oxygen, what are its compounds with metals and bases termed?
- How may chlorides in solution or hydrochloric acid be recognized?
- How may chlorates be recognized?
- How is chlorine water recognized?
- What amount of the gas should it contain?
- Explain the reaction which takes place in its production.
- How may its strength be tested?
- How may excess of hydrochloric acid be detected?
- How may chlorine water be prepared extemporaneously?
- What explosive gas is generated at the same time?
- What does the liquid contain besides chlorine?
- What are the uses of chlorine water?
- How may chlorine be conveniently used as a disinfectant?
- What is chlorinated lime? Give its Latin name.
- How much available chlorine should it contain?
- How is it prepared?
- What is a popular name for it?
- Wherein does it differ from the French preparation known as "Eau de Javelle" (Javelle's Water)?
- Give the symbol and atomic weight of bromine.

- Where is it obtained, and how is it prepared?
Describe the process.
What is bittern, and what does it contain?
What is the character of the vapor of bromine?
What is its combination with hydrogen called?
What are its salts called?
What are the tests for bromine?
What is its specific gravity?
How may the presence of iodine be detected?
What is its medicinal use?
What is "Bibron's antidote" to rattlesnake poison?
Give the symbol and atomic weight of iodine.
How was it formerly obtained, and how is it now obtained?
Explain the reaction which takes place in its production.
How soluble is iodine in alcohol?
How may the following impurities be detected?—viz.: moisture; iodine chloride; iodine cyanide; more than traces of chlorine or bromine.
In what form is its combination with hydrogen official?
What are the tests for iodine and the iodides?
What is its use in medicine?
What is tincture of iodine?
How may its strength be tested?
How is it used medicinally, and what is the dose?
Give the formula for compound solution of iodine.
What is the official name and synonyme of compound solution of iodine?
How much iodine does a fluidounce of the solution contain?
What is the object of using iodide of potassium in this preparation?
How much iodine is there in a fluidounce?
How is it used medicinally, and what is the dose?
What is ointment of iodine?
How is syrup of hydriodic acid prepared?
How much absolute hydriodic acid does it contain?
What is its specific gravity?
What are the objects of this preparation?
What is the chemical reaction which takes place when hydrosulphuric acid is passed into a solution containing iodine?
What is the use of syrup of hydriodic acid, and what is the dose?

CHAPTER XXXV.

SULPHUR AND PHOSPHORUS.

S; 31.98. P; 30.96.

THESE two elements furnish many important compounds to medicine. They present several analogies, both physically and chemically.

Official Preparations of Sulphur and Phosphorus.

Sulphur Sublimatum.—Made by subliming crude sulphur.

Sulphur Lotum.—Made by washing sublimed sulphur.

Sulphur Præcipitatum.—Made by precipitating a solution of calcium disulphide with HCl.

Sulphuris Iodidum.—Made by heating iodine with sulphur.

Unguentum Sulphuris.—Made by mixing 80 parts of sublimed sulphur with 70 parts of benzoinated lard.

Sulphur loosely combined.

Hydrogen Sulphide.—By acting on ferrous sulphide with diluted sulphuric acid. (See Tests.)

Carbonei Disulphidum.—By passing sulphur vapor over red-hot charcoal.

Phosphorus.—Made by deoxidizing phosphoric acid with carbon.

Oleum Phosphoratum.—Made by dissolving 1 per cent. of phosphorus in almond oil.

Pilulæ Phosphori.—Each pill contains $\frac{1}{100}$ of a grain of phosphorus.

Unofficial Compounds of Sulphur and Phosphorus.

Acidum Hyposulphurosum, H_2SO_2 .

Hyposulphurous Acid.

Acidum Hypophosphorosum, H_3PO_2 .

Hypophosphorous Acid.

Acidum Metaphosphoricum, HPO_3 .

Metaphosphoric Acid.

Acidum Phosphorosum, H_3PO_2 .

Phosphorous Acid.

Acidum Pyrophosphorosum, $H_4P_2O_7$.

Pyrophosphorous Acid.

Add metallic zinc to sulphurous acid contained in a closed vessel.

Decompose barium hypophosphite by the aid of sulphuric acid, filter, and evaporate to a syrupy consistence. (See Acidum Hypophosphorosum Dilutum, page 488.)

Evaporate a solution of phosphoric acid until the residue ceases to give off water. This solidifies on cooling, and on exposure absorbs moisture and deliquesces.

Expose phosphorus to moist air under a bell-jar, and collect the heavy white vapor which falls, in a vessel containing water.

Precipitate sodium pyrophosphate with a solution of lead acetate, and decompose the well-washed lead pyrophosphate with hydrogen sulphide.

Sulphur. S; 31.98.

Sulphur is found uncombined in Sicily and in other parts of the world. In the form of sulphates and sulphides it is widely diffused. It is prepared for use by fusing it, allowing it to stand to permit the earthy impurities to settle, and then pouring it into cylindrical moulds. The sulphur in cylinders is termed *roll-sulphur*.

Three forms of sulphur are official,—sublimed, washed, and precipitated sulphur.

Sulphur forms with hydrogen an offensive gas, which is known officially as hydrogen sulphide, H_2S . It is also termed *sulphuretted hydrogen* and *hydrosulphuric acid*. The formula for its preparation will

be found under "Tests," in Part V. It is used for proving the presence or absence of certain metallic salts, lead, bismuth, antimony, copper, mercury, zinc, etc., with which it produces characteristic precipitates. *Sulphides* are compounds of elements with sulphur. Some of the sulphides are analogous to acids, others to bases; and these different sulphides, by combining with one another, form compounds, which, from their analogy to salts, are called by Berzelius *sulpho-salts*. It forms with oxygen two oxides, *sulphurous oxide*, SO_2 , and *sulphuric oxide*, SO_3 . These oxides, by their union with water, form *sulphurous acid*, H_2SO_3 , and *sulphuric acid*, H_2SO_4 . These are considered in the chapter on inorganic acids. There is also known *hyposulphurous acid*, H_2SO_2 , the corresponding oxide of which is not known, and *thiosulphuric acid* (frequently known as hyposulphurous acid), $\text{H}_2\text{S}_2\text{O}_3$, and a series of acids, $\text{H}_2\text{S}_3\text{O}_6$, $\text{H}_2\text{S}_4\text{O}_8$, $\text{H}_2\text{S}_5\text{O}_{10}$, and $\text{H}_2\text{S}_6\text{O}_{12}$, known as the *thionic series*. Sulphurous acid forms with bases salts which are termed *sulphites*. The salts similarly produced from sulphuric acid are termed *sulphates*. The sulphates are much more important salts. Pharmaceutically, they have totally different properties. The official sulphites and sulphates will be considered under their respective bases.

Tests for Sulphites and Sulphurous Acid.

1. Solution of barium chloride produces with sulphurous acid or a solution of a sulphite, a white precipitate of barium sulphite, which is soluble in hydrochloric acid.
2. If a solution of a sulphite or sulphurous acid be added to diluted sulphuric acid and zinc, hydrogen sulphide gas is liberated.
3. An acid solution of potassium permanganate is decolorized and deoxidized by sulphurous acid.

Tests for Sulphates and Sulphuric Acid.

1. A solution of barium chloride produces a white insoluble precipitate of barium sulphate with sulphuric acid or a soluble sulphate.
2. A soluble salt of lead produces a white insoluble precipitate of lead sulphate with sulphuric acid or a soluble sulphate.

SULPHUR SUBLIMATUM. U. S. Sublimed Sulphur.

S; 81.98.

Preparation.—When vapors of sulphur are conducted into a chamber properly cooled, they are condensed in the form of a crystalline powder, which collects on the sides and bottom of the chamber. The yellowish powder is known as sublimed sulphur, or *flowers of sulphur*. It is in the form of a fine, yellow powder, having a slight, characteristic odor, and a faintly acid taste. Insoluble in water; slightly soluble in absolute alcohol; more readily soluble in benzin, benzol, oil of turpentine, and many other oils; also in ether, in chloroform, and in boiling, aqueous solutions of alkaline hydrates. Carbon disulphide promptly dissolves a portion of it, but leaves a residue of crystalline sulphur, which may be dissolved by a boiling solution of an alkaline hydrate.

At 115° C. (239° F.) it melts, and at a higher temperature it volatilizes, or, if air be admitted, burns to sulphur dioxide, characterized by its odor, and by its blackening a strip of paper moistened with mercurous nitrate T.S. held in the gas. When agitated with water, the latter gives an acid reaction with litmus paper. The amount of residue left after volatilizing or burning a weighed portion of it should not exceed 0.5 per cent.

Uses.—Sublimed sulphur is given internally as a laxative and diaphoretic, in doses of from one to three drachms (3.8 to 11.6 Gm.). It is often combined with potassium bitartrate and administered to children mixed with honey or molasses. In diphtheritic croup it is sometimes used to remove the exudation by insufflation; externally, it is used as an ointment in scabies and other skin diseases.

SULPHUR LOTUM. U.S. Washed Sulphur.

S = 81.98.

	Metric .	Old form.
Sublimed Sulphur	100 Gm.	16 oz. av.
Ammonia Water	10 C.c.	1½ fl. oz.
Water, a sufficient quantity.		

Pass the Sublimed Sulphur through a No. 30 sieve, mix it thoroughly with 100 C.c. [old form 1 pint] of Water, add 10 C.c. [old form 1½ fl. oz.] of Ammonia Water, and digest for three days, agitating occasionally. Then add 100 C.c. [old form 1 pint] of Water, transfer the mixture to a muslin strainer, and wash the Sulphur with Water until the washings cease to impart a blue color to red litmus paper. Then allow it to drain, press the residue strongly, dry it rapidly at a moderate heat, and pass it through a No. 30 sieve.

Sublimed sulphur is frequently contaminated with small quantities of sulphuric acid and other impurities, and the object of the ammonia in the above process is to neutralize the acid, the ammonium sulphate being subsequently washed out.

Sulphur Lotum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Absolute Alcohol.	Other Solvents.
A fine yellow powder. When heated to 115° C. (239° F.), Washed Sulphur melts, and at a higher temperature it is volatilized, or, if air be admitted, burns to sulphur dioxide, which is identified by its characteristic odor, and by its blackening a strip of paper moistened with mercurous nitrate T.S. held in the gas. The amount of residue left after volatilizing or igniting a weighed portion of it should not exceed 0.5 per cent.	Odorless and tasteless.	Insoluble.	Slightly soluble.	More readily soluble in benzin, benzol, oil of turpentine, and many other oils; also in ether, in chloroform, and in boiling, aqueous solutions of alkaline hydrates. Carbon disulphide promptly dissolves a portion of it, but leaves a residue of insoluble sulphur, which may be dissolved by a boiling solution of an alkaline hydrate.

IMPURITIES.	TESTS FOR IMPURITIES.
Earthy or Metallic Impurities.	{ If 0.5 Gm. of Washed Sulphur be boiled with 10 C.c. of sodium hydrate T.S., it should be completely dissolved, leaving no residue.
Arsenic.	{ If 0.5 Gm. of Washed Sulphur be digested for several hours with 10 C.c. of ammonia water, the clear filtrate should not be colored yellow, nor be rendered turbid, by acidulation with hydrochloric acid, even after the addition of an equal volume of hydrogen sulphide T.S.
Acid and Ammonia.	{ If 5 C.c. of water be agitated with 2 Gm. of Washed Sulphur, the liquid should not change the color of red or blue litmus paper.
Selenium.	{ If 0.5 Gm. of Washed Sulphur be boiled with a solution of 0.5 Gm. of potassium cyanide in 5 C.c. of water, and, after filtration, the clear liquid be acidulated with hydrochloric acid, it should not assume a reddish color, even after standing for an hour.

Uses.—Washed sulphur is preferred to sublimed sulphur for internal administration; the small quantity of sulphuric acid present in the latter sometimes produces griping. The dose is from one to three drachms. It is used in the preparation of Compound Liquorice Powder, Iodide of Sulphur, and Sulphur Ointment. (See Pulveres and Unguenta.)

SULPHUR PRÆCIPITATUM. U. S. Precipitated Sulphur.

S = 81.98.

	Metric.	Old form.
Sublimed Sulphur	100 Gm.	16 oz. av.
Lime	50 Gm.	8 oz. av.
Hydrochloric Acid,		
Water, each, a sufficient quantity.		

Slake the Lime, and mix it uniformly with 500 C.c. [old form-5 pints] of Water. Add the Sublimed Sulphur, previously sifted, and, after thorough mixing, add 1000 C.c. [old form 10 pints] of Water, and boil the mixture during one hour, stirring constantly, and replacing the Water lost by evaporation. Then cover the vessel, and permit the contents to cool and to become clear by subsidence. Carefully draw off the clear solution, and filter the remainder. To the united liquids add gradually, and with constant stirring, Hydrochloric Acid, previously diluted with an equal volume of Water, until the liquid is nearly neutralized, still retaining, however, an alkaline reaction and a yellow color. Collect the precipitate on a strainer, and wash it, until the washings are tasteless and cease to give an acid reaction with litmus paper. Then dry the product rapidly, at a moderate heat, and keep it in well-stoppered bottles.

In the above process the lime and sulphur react so as to form calcium disulphide and calcium thiosulphate (hyposulphite):

On the addition of hydrochloric acid, the sulphur is precipitated:

In some processes sulphuric acid is used instead of hydrochloric acid, and calcium sulphate is precipitated with the sulphur. This furnishes an inferior product, and is called *lac sulphuris*, or *milk of sulphur*.

Sulphur Precipitatum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Absolute Alcohol.	Other Solvents.
A fine yellow, amorphous powder. At 115° C. (239° F.) Precipitated Sulphur melts, and at a higher temperature it volatilizes, or, if air be admitted, burns to sulphur dioxide, leaving no residue.	Odorless and tasteless.	Insoluble.	Very slightly.	Readily soluble in carbon disulphide; also in benzine, benzol, oil of turpentine, and many other oils; also in ether, in chloroform, and in boiling aqueous solutions of alkaline hydrates.

IMPURITIES.	TESTS FOR IMPURITIES.
Earthy or Metallic Impurities.	If 0.5 Gm. of Precipitated Sulphur be boiled with 10 C.c. of sodium hydrate T.S., it should be completely dissolved, leaving no residue.
Arsenic.	If 1 Gm. of Precipitated Sulphur be digested for several hours with 10 C.c. of ammonia water, a portion of the clear filtrate should not leave any residue on evaporation; nor should another portion be colored yellow, or rendered turbid, by acidulation with hydrochloric acid, even after the addition of an equal volume of hydrogen sulphide T.S.
Acid or Alkali.	If 5 C.c. of water be agitated with 2 Gm. of Precipitated Sulphur, the liquid should not change the color of blue or red litmus paper.
Soluble Impurities.	Nor should it leave any residue on evaporation.
Selenium.	If 0.5 Gm. of Precipitated Sulphur be boiled with a solution of 0.5 Gm. of potassium cyanide in 5 C.c. of water, and, after filtration, the clear liquid be acidulated with hydrochloric acid, it should not assume a reddish color, even after standing for an hour.

Uses.—Precipitated sulphur is much to be preferred to the other forms in liquid mixtures, as the particles are lighter and more easily suspended; the ointments made with it are smoother than those made with sublimed sulphur. The dose is from one to three drachms [3.8 to 11.6 Gm.].

SULPHURIS IODIDUM. U.S. Sulphur Iodide.

	Metric.	Old form.
Washed Sulphur	20 Gm.	60 grains.
Iodine	80 Gm.	240 grains.

Mix the Washed Sulphur and Iodine thoroughly by trituration; introduce the mixture into a flask, close the orifice loosely, and, by means of a water-bath, gradually and with occasional agitation apply a heat not exceeding 60° C. (140° F.), until the ingredients combine, and become of a uniformly dark color throughout. Then increase the heat to the boiling point of the water, so as to fuse the mass. Should any Iodine have sublimed and condensed on the glass, incline the flask so as to combine the Iodine with the fused mass, and then pour the latter out upon a porcelain plate or other suitable cold surface. After cooling, break the product into pieces of suitable size, and keep them in a glass-stoppered bottle, in a cool place.

This compound is one of the instances of the direct chemical union of two elements, heat being the only agent used to effect the combination: it is sometimes called *subiodide of sulphur*, or *iodine disulphide*, S_2I_2 . There are some doubts, however, as to its being a definite chemical compound.

Sulphuris Iodidum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Brittle masses of a crystalline fracture and a grayish-black, metallic lustre.	Odor of iodine; somewhat acrid taste; faintly acid reaction.	Almost insoluble.	Alcohol dissolves out the iodine and leaves the sulphur.	Very soluble in carbon disulphide; also in 60 parts of glycerin. Ether and alcohol dissolve out the iodine and leave the sulphur. Continued boiling with water vaporizes all the iodine, leaving about 20 per cent. of sulphur as residue.

TEST FOR IDENTITY.

On exposing Sulphur Iodide to the air, it gradually loses iodine. On heating it, some iodine sublimates at first; at a somewhat higher temperature a sublimate is formed, containing both iodine and sulphur. At a still higher temperature, the whole is volatilized, leaving only a trace of residue.

Uses.—Sulphur iodide is principally used externally in skin diseases in the form of an ointment.

CARBONEI DISULPHIDUM. U.S. Carbon Disulphide.

CS_2 ; 75.98.

[CARBONEI BISULPHIDUM, PHARM. 1880.]

Carbon Disulphide should be kept in well-stoppered bottles, or in tin cans, in a cool place, remote from lights or fire.

This sulphide is prepared by the direct combination of carbon and sulphur at a moderate red heat. To effect this, charcoal is heated to redness in a vertical cylinder, while sulphur is admitted through a lateral tubulure near the bottom. As the sulphur melts and vaporizes, it combines with the carbon, and the carbon disulphide formed distills over through a series of condensing tubes, which, while they serve to collect the crude carbon disulphide, allow of the escape of the hydrogen sulphide formed at the same time.

It is purified by agitation with mercury and distillation in contact with white wax. It can by repeated rectification be entirely freed from its usual disgusting odor.

Carbonei Disulphidum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A clear, colorless, very diffusive, highly refractive liquid. Sp. gr. 1.268 to 1.269 at 15° C. (59° F.).	Strong characteristic but not fetid odor; sharp, aromatic taste; neutral reaction.	Soluble in 535 parts of water at 15° C. (59° F.).	Very soluble.	Soluble in ether, chloroform, and fixed or volatile oils.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
It vaporizes rapidly at ordinary temperatures, is highly inflammable, boils at 46° – 47° C. (114.8° – 116.6° F.), and, when ignited, burns with a blue flame, producing carbon and sulphur dioxide.	Sulphur Dioxide. Dissolved Sulphur. Hydrogen Sulphide.	{ Carbon Disulphide should not affect the color of blue litmus paper moistened with water. { A portion of the liquid evaporated spontaneously in a glass vessel should leave no residue. { Lead acetate T.S. agitated with the liquid should not be blackened.

Uses.—Carbon disulphide is used principally as a solvent. It is the best solvent for rubber and similar bodies. It is poisonous when taken internally, and the continuous inhalation of its vapor is very injurious.

PHOSPHORUS. U. S. Phosphorus.

P; 80.96.

Preparation.—Phosphorus is a non-metallic element prepared by heating acid calcium phosphate with charcoal. The acid calcium phosphate is obtained by treating calcium phosphate with sulphuric acid, calcium sulphate also being formed; the latter is afterwards separated.

Phosphorus should be carefully kept under water, in strong, well-closed vessels, in a secure and moderately cool place, protected from light.

Of the allotropic forms of phosphorus, *red phosphorus*, or *amorphous phosphorus*, is the most important. It is obtained by allowing phosphorus to remain for several days in an atmosphere of carbon dioxide at a temperature varying from 215° C. (419° F.) to 250° C. (482° F.)

Red phosphorus is not luminous and not poisonous until it is heated to 280° C. (536° F.), when it is converted into ordinary phosphorus.

Phosphorus forms with oxygen three oxides,—*phosphoric*, P_2O_5 , *phosphorous*, P_2O_3 , and *hypophosphorous*, P_2O , although the existence of the latter is somewhat doubtful. Corresponding to the first of these are three acids, known as *orthophosphoric* (tribasic phosphoric), H_3PO_4 , *pyrophosphoric*, $\text{H}_4\text{P}_2\text{O}_7$, and *metaphosphoric*, HPO_3 . Orthophosphoric acid is formed by dissolving P_2O_5 in boiling water, or by the action of nitric acid upon phosphorus itself; pyrophosphoric acid, by the heating of the tribasic phosphoric acid to 213° C. (415.4° F.); and metaphosphoric acid, by the ignition of the tribasic variety, or by dissolving P_2O_5 in cold water. *Phosphorous acid*, H_3PO_3 , cannot be formed directly from phosphorous oxide. This is a dibasic acid, containing one hydrogen atom not replaceable by metal. *Hypophosphorous acid*, H_3PO_2 , is not capable of being derived directly from hypophosphorous oxide. It is monobasic, containing two hydrogen atoms not replaceable by metal.

Tests for Phosphates and Phosphoric Acids.

1. Solution of silver nitrate produces a yellow precipitate with a neutral solution of an orthophosphate, soluble both in nitric acid and in ammonia. It produces a white precipitate with pyrophosphoric acid or metaphosphoric acid.

2. If albumen be added to metaphosphoric acid, or to a solution of a metaphosphate containing acetic acid, a white precipitate is produced. No precipitate occurs if it be added to pyrophosphoric acid or orthophosphoric acid.

3. Official test-solution of magnesium (see Tests) produces with phosphoric acid or a solution of a phosphate a precipitate of ammonio-magnesium phosphate.

4. If solution of ammonium molybdate in diluted nitric acid be added in excess to phosphoric acid or to a solution of a phosphate in nitric acid, and heat applied, a yellow precipitate of ammonium phosphomolybdate will be produced.

5. If a solution of barium chloride be added to a neutral solution of a phosphate, a white precipitate of barium phosphate is produced, which is soluble in acids.

Tests for Hypophosphites.

1. When heated, they evolve spontaneously inflammable hydrogen phosphide.

2. An acid solution of potassium permanganate is decolorized.

3. From solution of mercuric chloride, mercury is precipitated upon the addition of a solution of a hypophosphite.

Phosphorus. U.S.	ODOR AND TASTE.	SOLUBILITY.	
		Water.	Other Solvents.
A translucent, nearly colorless solid, of a waxy lustre, having, at the ordinary temperature, about the consistence of beeswax. By long keeping, the surface becomes red, and occasionally black. It melts at 44° C. (111.2° F.). Sp. gr. 1.830 at 10° C. (50° F.).	Distinctive and disagreeable odor; distinctive and disagreeable taste. (Should not be tasted, except in a state of great dilution.)	Insoluble.	Soluble in 350 parts of absolute alcohol at 15° C. (59° F.), in 240 parts of boiling absolute alcohol, in 80 parts of absolute ether, in about 50 parts of any fatty oil, and very soluble in chloroform or carbon disulphide, the latter yielding a solution which must be handled with the greatest care to prevent danger from fire.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
When exposed to the air, it emits white fumes, which are luminous in the dark, and have an odor somewhat resembling that of garlic. On longer exposure to air, it takes fire spontaneously.	<div>Arsenic.</div> <div>Sulphur.</div>	<p>Add 3 Gm. of Phosphorus to 15 C.c. of nitric acid diluted with 15 C.c. of distilled water in a flask having the capacity of 50 C.c., and digest the mixture at a gentle heat on a water-bath, until the Phosphorus is dissolved. Transfer the solution to a capsule, and evaporate it until no more nitrous vapors are given off, and then dilute the solution to 30 C.c. with distilled water. Heat 20 C.c. of the diluted solution to about 70° C. (158° F.) for half an hour, passing hydrogen sulphide through it during the half hour's heating, and then until the liquid has become cold. If the liquid be now allowed to stand at rest during twenty-four hours, not more than a very small quantity of lemon-yellow precipitate should be visible (limit of arsenic).</p> <p>On adding barium chloride T.S. to the remainder of the liquid, not more than a slight opalescence should be produced (limit of sulphur).</p>	

Uses.—Phosphorus is administered internally, in doses of $\frac{1}{100}$ of a grain (0.0006 Gm.), as a nervous stimulant. In large doses it is poisonous. Its value in this connection depends upon its being administered in a free state. The oxide of phosphorus, phosphoric acid, does not have the same action: hence all pharmaceutical preparations of phosphorus must be protected from oxidation. (See *Pilulæ Phosphori*.)

OLEUM PHOSPHORATUM. U. S. Phosphorated Oil.

	Metric.	Old form.
Phosphorus	1 Gm.	4 grains.
Expressed Oil of Almond,		
Ether, each, a sufficient quantity,		
To make	100 Gm.	1 fl. oz.

Introduce a sufficient quantity of Expressed Oil of Almond into a flask, heat it on a sand-bath to 250° C. (482° F.), and keep it at that temperature for fifteen minutes. Then allow it to cool, and filter it. Put 90 Gm. [old form 7 fl. dr.] of the filtered Oil together with the Phosphorus, previously well dried by filtering paper, into a dry, tared bottle capable of holding about 120 C.c. [old form 2 fl. oz.], insert the stopper, and heat the bottle in a water-bath until the Phosphorus melts. Then agitate it until the Phosphorus is dissolved, allow it to cool, add enough Ether to make the mixture weigh 100 Gm. [or measure, old form, 1 fl. oz.], and agitate it again. Lastly, transfer the solution to small glass-stoppered vials, which should be completely filled and kept in a cool and dark place.

The object of this preparation is to administer phosphorus in minute doses, dissolved in a bland oil. When fresh, it is a clear and colorless or slightly colored oil, not phosphorescent in the dark, and having the odor and taste of phosphorus quite distinctly. The object of heating the oil is to expel air and traces of water, which would aid in oxidizing the phosphorus. The ether not only assists in the preservation of the finished preparation, but is of use in rendering the oil less disagreeable to the taste. It may be administered in the form of an emulsion, preferably the official almond emulsion, and flavored with oil of bitter almond, or in capsules: each minim contains about $\frac{1}{125}$ of a grain of phosphorus. The dose of the U. S. solution is from three to five minims (0.18 to 0.3 C.c.).

QUESTIONS ON CHAPTER XXXV.

SULPHUR AND PHOSPHORUS.

- Give the symbol and atomic weight of sulphur.
 Where does it come from, and how is it prepared?
 What is roll-sulphur?
 In what forms is sulphur official?
 What gas is formed by it in combination with hydrogen?
 For what is this gas used?
 What are sulphides?
 What are salts, called sulpho-salts by Berzelius?
 What combination does sulphur form with oxygen?
 What do these oxides form by their union with water?
 Give their formulas in symbols.
 What is hyposulphurous acid?
 Is there an oxide corresponding to this acid?
 What is thiosulphuric acid?
 What acids are known as the thionic series of acids?
 What are the salts which sulphurous acid forms with bases called, and what those which are similarly produced from sulphuric acid?
 Which are more important salts, sulphates or sulphites?
 What are the tests for sulphites and sulphurous acid? For sulphates and sulphuric acid?
 What is sublimed sulphur?
 What are its physical properties?
 How is it used medicinally, and what is the dose?
 How is washed sulphur prepared?
 What is the use of adding ammonia in washing it?
 At what temperature does it melt?
 How may impurities of free acid be detected? Of arsenous sulphide? Of arsenous acid?
 Why is washed sulphur preferred for medicinal purposes?
 What is the dose?
 In what official preparations is it used?
 How is precipitated sulphur prepared?
 Explain the reaction that takes place between lime and sulphur in the above process.
 What would be the result if sulphuric acid were used instead of hydrochloric acid to precipitate the sulphur?
 What is the popular name of this preparation?
 How may the following impurities be detected?—viz.: free acid; calcium sulphate; alkalies, alkaline earths, or sulphide; arsenous sulphide; arsenous acid.
 For what uses is precipitated sulphur preferable to other forms of sulphur?
 What is the dose?
 How is sulphur iodide prepared?
 What is it called chemically?
 Is it a definite chemical compound?
 How may it be tested?
 What is its use?
 Carbon disulphide—Give formula in symbols and molecular weight.
 How is it prepared, and how may it be purified?
 What are its physical properties?
 What is its specific gravity?
 How may the following impurities be detected?—viz.: sulphurous acid; sulphur; hydrogen sulphide.
 For what is it used? Is it ever used internally?
 Phosphorus—Give symbol and atomic weight.
 What is phosphorus, and how is it prepared?
 How is acid calcium phosphate obtained?
 Explain the reaction which takes place in its formation.
 How is red phosphorus, or amorphous phosphorus, obtained?
 What are its peculiar properties?

What oxides does phosphorus form with oxygen?
Give their formulas in symbols.
What three acids correspond to phosphoric oxide?
How is orthophosphoric acid formed?
What is its formula in symbols?
How is pyrophosphoric acid obtained?
Give its formula in symbols.
How is metaphosphoric acid obtained?
Give its formula in symbols.
Can phosphorous acid be formed directly from phosphorous oxide?
What is the character of its basicity?
Can hypophosphorous acid be obtained directly from hypophosphorous oxide?
What is the character of its basicity?
What are the tests for phosphates and phosphoric acid?
What are the tests for hypophosphites?
What is the specific gravity of phosphorus? What is its melting-point?
How may impurities be detected?—Sulphur; arsenic.
What is its medicinal action, and what is the dose?
Upon what does its value depend?
Does phosphoric acid have the same action?
Give the formula for phosphorated oil.
What is the object of this preparation?
How may it be administered?
What is the dose?
How much phosphorus is there in 5 minims?

CHAPTER XXXVI.

CARBON, BORON, AND SILICON.

C; 11.97. B; 10.9. Si; 28.3.

THESE three elements present some analogies, and, although the number of pharmaceutical preparations made from them is not great, they are of considerable interest.

Official Preparations of Carbon, Boron, and Silicon.

Carbo Animalis.—Prepared by burning bones out of contact with air.
Carbo Animalis Purificatus.—Made by purifying animal charcoal with HCl.
Carbo Ligni.—Made by burning wood out of contact with air.
Carbonei Disulphidum.—See preparations of sulphur.
Acidum Boricum.—Made by purifying the natural product.
Sodii Boras.—See preparations of soda.
Liquor Sodii Silicatis.—Made by fusing silica with dried sodium carbonate and dissolving the product.

Carbon. C; 11.97.

Carbon is a very widely diffused element. It is a constituent of all organic substances, and is found in nature in the form of the diamond, graphite, plumbago, coal, etc.

Two compounds with oxygen are known,—carbon dioxide, CO₂, and carbon monoxide, CO.

Carbon dioxide, CO₂, is a colorless, odorless gas, with a slightly acid taste, heavier than ordinary air. It is not combustible, and not a supporter of combustion; indeed, it is used extensively in fire-extinguishers and other contrivances to extinguish flame. Water is capable of absorbing its own volume of carbon dioxide, but many times its volume under pressure. This solution was formerly official, under the name of *Aqua Acidi Carbonici*, or carbonic acid water, the well-known "soda water."

Carbonic acid, H₂CO₃, is produced when carbon dioxide is brought in contact with water.

The salts known as carbonates are widely diffused in nature, and many chemical processes are based upon the decomposition of carbonates by strong acids. Carbonic acid, although present everywhere, is one of the weakest acids known.

Carbon monoxide, CO, is of little interest in pharmacy.

The compounds of carbon and hydrogen are very numerous, and of great importance. They are mostly obtained from organic substances, and will be considered under Part IV. With nitrogen, carbon forms cyanogen, the compound radical of hydrocyanic or prussic acid.

Tests for Carbonates.

1. Decompose by the addition of a strong acid, and pass the gas through lime-water. Insoluble calcium carbonate is formed.

2. The solutions of many of the salts of the metals, like iron, copper, lead, etc., are precipitated by the soluble carbonates.

CARBO ANIMALIS. U. S. Animal Charcoal.

O; 11.97.

Preparation.—Animal charcoal is made by subjecting bones to a red heat in close vessels.

Bone consists of animal matter with calcium phosphate and carbonate. In consequence of the decomposition of the animal matter involved by the destructive distillation, the nitrogen and hydrogen, united as ammonia, distil over, while the greater part of the carbon is left in the cylinder, intermingled with the calcium salts.

The charcoal is termed *bone-black* or *ivory-black*, and in manufacturing it the bones are boiled in water, to separate the fat, before being subjected to destructive distillation in the iron cylinders. These are connected with vessels which receive the ammoniacal liquor, called *bone-spirit*, together with a dark tarry liquid (*bone-oil*).

Official animal charcoal is in dull-black, granular fragments, or a dull-black powder, odorless and nearly tasteless, and insoluble in water or in alcohol. When ignited, it leaves a white ash, amounting to at least 85 per cent. of the original weight, which should be completely soluble in hydrochloric acid, with the aid of heat.

Uses.—Animal charcoal is used to deprive substances of color (see Decoloration, page 233).

CARBO ANIMALIS PURIFICATUS. U. S. Purified Animal Charcoal.

	Metric.	Old form.
Animal Charcoal, in No. 60 powder	100 Gm.	16 oz. av.
Hydrochloric Acid	300 Gm.	40 fl. oz.
Boiling Water, a sufficient quantity.		

Introduce the Animal Charcoal into a capacious flask, add 200 Gm. [old form 26 fl. oz.] of Hydrochloric Acid, and 100 C.c. [old form 15 fl. oz.] of Boiling Water, and connect the flask with an up-right condenser. By means of a sand-bath keep the mixture gently boiling during eight hours. Then add 500 C.c. [old form 4½ pints] of Boiling Water, transfer the mixture to a muslin strainer, and, when the liquid has run off, return the Charcoal to the flask. Add to it 100 C.c. [old form 14 fl. oz.], each, of Hydrochloric Acid and of Boiling Water, boil for two hours, again add 500 C.c. [old form 4½ pints] of Boiling Water, transfer the whole to a plain filter, and, when the liquid has run off, wash the residue with Boiling Water until the washings give

only a faint cloudiness with silver nitrate test-solution. Dry the powder in a drying oven, and immediately transfer to well-stoppered vials.

The object of purifying animal charcoal by treatment with hydrochloric acid is to separate the calcium phosphate and carbonate which are invariably present in the crude bone-black. In some decolorizing operations these impurities are harmless, but in many delicate chemical processes they may be dissolved or decomposed, and thus seriously contaminate the products which the charcoal is intended to purify.

Official purified animal charcoal is a dull-black powder, odorless and tasteless, and insoluble in water, alcohol, or other solvents. When ignited at a high temperature with a little red mercuric oxide, and with free access of air, it leaves at most only a trace of residue. Complete carbonization is shown by the official test:

"If 1 Gm. of the powder be boiled with a mixture of 3 C.c. of potassium hydrate T.S. and 5 C.c. of water during three minutes, the filtrate should be colorless."

CARBO LIGNI. U. S. Charcoal.

Preparation.—Charcoal prepared from soft wood is preferred for medical purposes. It is made by burning wood out of contact with air, either in iron cylinders or in stacks. In the former case, the volatile products resulting from the destructive distillation are collected by condensation, and contribute valuable products to pharmacy (see *Acidum Aceticum*). In the latter, the charcoal is made in the neighborhood of a cheap wood-supply. Billets of wood are piled in a conical form, and covered with earth and sod to prevent the free access of air, several holes being left at the bottom and one at the top of the pile in order to produce a draught to commence the combustion. The wood is kindled from the bottom, and soon after ignition the hole at the top is closed, and when the wood is all ignited the holes at the bottom are stopped. The result is that the volatile portions of the wood, hydrogen, oxygen, water, etc., are dissipated, carbon being left.

Uses.—Charcoal is used in medicine as an absorbent and disinfectant. It is given in the form of powder, in doses of one to two drachms (3.8 to 7.7 Gm.). Owing to its absorbent powers, it should never be kept exposed to the air, as it will become unfit for use if subjected to the atmosphere of a laboratory or pharmacy. Tin cans with tightly-fitting covers are appropriate containers.

Boron. B; 10.9.

Boron, like carbon, exists in three allotropic conditions,—amorphous, crystallized, and graphitoidal. Boron combines with hydrogen and oxygen, and boric (or boracic) acid is produced, H_2BO_3 , the principal salt of which is *Sodii Boras*, or borax (see page 562).

Tests for Borates and Boric Acid.

1. A colorless flame is tinged green by an alcoholic solution of boric acid.
2. A solution of a borate, if slightly acidified by hydrochloric acid, turns the yellow color of turmeric paper brown, if the paper is allowed to dry.

Unofficial Preparations of Boron.

Acidum Metaboricum, HBO_2 , By heating boric acid to 38°C . (100°F).
Metaboric Acid.

Acidum Pyroboricum, $\text{H}_2\text{B}_4\text{O}_7$, By heating boric acid for a long time to 80°C . (140°F).
Pyroboric Acid.

Boron Trisulphidum, B_2S_3 , By heating boron in the vapor of sulphur and collecting the
Boron Trisulphide. resulting white mass.

ACIDUM BORICUM. U.S. Boric Acid (Boracic Acid).

H_3BO_3 ; 61.78.

Preparation.—The lagoons of the volcanic districts of Tuscany formerly furnished the greater part of the boric acid and borax of commerce. Borax is now found native in California, and boric acid is produced by decomposing borax with hydrochloric acid.

Boric acid is required in very fine powder for most medical uses.

Acidum Boricum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Transparent, colorless, somewhat pearly lustre, or, when in perfect crystals, six-sided, triclinic plates, slightly unctuous to the touch, permanent in the air. The addition of hydrochloric acid increases its solubility in water.	Odorless; coolish, bitterish; feebly acid in solution, turning blue litmus paper red, and turmeric paper brownish-red after drying, even when the solution is acidulated with hydrochloric acid: this color is changed to bluish-black by ammonia water.	Cold, 25.6 parts. Boiling, 3 parts.	Cold, 15 parts. Boiling, 5 parts.	Glycerin, 10 parts.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated to 100°C . (212°F .), Boric Acid loses water, metaboric acid (HBO_2) is formed and slowly volatilizes at that temperature. Heated to 160°C . (320°F .), it fuses to a glassy mass of tetraboric (or pyroboric) acid ($\text{H}_2\text{B}_4\text{O}_7$); at a higher temperature, the fused mass swells up, loses all of its water, and becomes boron trioxide (B_2O_3), which fuses into a transparent, non-volatile mass. The alcoholic or glycerin solution burns with a flame tinged with green; from a boiling solution the acid readily volatilizes.	Iron.	In a solution of 1 Gm. of Boric Acid in a mixture of 1 C.c. of hydrochloric acid and 49 C.c. of water, 0.5 C.c. of potassium ferrocyanide T.S. should not at once produce a blue color. A 2-per-cent. aqueous solution of the Acid should not be precipitated by barium chloride T.S. Silver nitrate T.S. with nitric acid. Ammonium sulphide T.S. Ammonium oxalate T.S. No odor of ammonia should be evolved by heating the acid with potassium or sodium hydrate T.S. A fragment heated on a clean platinum wire in a non-luminous flame should not impart a persistent yellow color. Sodium phosphate T.S. and ammonia water.
	Sulphate.	
	Chloride.	
	Lead, Copper, Iron, etc.	
	Calcium.	
	Ammonia.	
	Sodium Salt.	
	Magnesium.	

Uses.—Boric acid is used in what is known as antiseptic surgery, and externally in the form of an ointment. It is added in small quantities to various liquids, to prevent fermentation. It is well adapted for such uses, as it communicates but little taste. It has not been proved to be innocuous, however, and therefore should be sparingly used. (See Boroglycerinum, Part VI. ; also Glyceritum Boroglycerini, p. 320.)

Silicon. Si ; 28.3.

Very few of the compounds of the non-metallic element silicon are used medicinally. Silicon, like carbon and boron, is obtained in three allotropic states,—amorphous, crystalline, and graphitoidal. In some of its combinations, notably in glass, earthen-ware, china, mortar, and cements of various kinds, it is of vast importance commercially. Silicon is found in nature combined with aluminum, magnesium, or calcium, in *pumice-stone*, *meerschaum*, *asbestos*, *talcum*, *soapstone*, etc. ; or as an anhydride (silica), in *sand*, *flint*, *agate*, *quartz*, etc.

Silica, SiO_2 , may be obtained in a pure condition by treating official solution of sodium silicate with hydrochloric acid.

Test for Silicates.

Silicates are insoluble in most reagents. If the soluble sodium and potassium silicates, in aqueous solution, be neutralized with hydrochloric acid, and ammonia water be added in excess, a gelatinous precipitate of silicic hydrate will separate.

LIQUOR SODII SILICATIS. U. S. Solution of Sodium Silicate.

Preparation.—Sodium silicate (Na_2SiO_3), or *soluble glass*, is made by fusing one part of fine sand and two parts of dried sodium carbonate, mixed in powder, in an earthen-ware crucible, and pouring out the fused mass on a stone slab to cool. This is pulverized, and treated with boiling water, to dissolve the soluble part. The solution is filtered and concentrated : crystals may be formed upon evaporation, if desired.

The salt is used commercially entirely in solution. This usually contains about 20 per cent. of silica and 10 per cent. of soda.

Liquor Sodii Silicatis. U. S.	ODOR, TASTE, AND REACTION.	TESTS FOR IDENTITY.
A semi-transparent, almost colorless, or yellowish, or pale greenish-yellow, viscid liquid. Sp. gr. between 1.300 and 1.400 at 15° C. (59° F.).	Odorless ; sharp, saline, and alkaline taste ; alkaline reaction.	A drop of the Solution, when held in a non-luminous flame, imparts to it an intensely yellow color. If a portion of the Solution, largely diluted with water, be supersaturated with nitric acid, a gelatinous or pulverulent, white precipitate of silicic hydrate will be produced.

Uses.—This solution is used in surgery in preparing mechanical dressings.

QUESTIONS ON CHAPTER XXXVI.

CARBON, BORON, AND SILICON.

- Carbon—Give symbol and atomic weight.
In what forms is carbon found in nature?
What compounds with oxygen are known? Give their formulas.
What are the physical properties of carbon dioxide?
What is carbonic acid? Is it a strong acid?
What is carbon monoxide?
What is cyanogen?
What are the tests for carbonates?
How is animal charcoal made?
What is the composition of bone?
What are the products when bones are subjected to destructive distillation?
Describe official animal charcoal.
For what purpose is it used?
How is "purified animal charcoal" made?
What is the object of purifying animal charcoal?
How is charcoal prepared?
What is its medicinal use? What is the dose?
Boron—Give symbol and atomic weight.
In what forms does boron exist?
What combination of it is formed with oxygen and hydrogen?
What are the tests for borates and boric acid?
What is boric acid? What is its synonyme? Give symbol and atomic weight.
How is it prepared? Where does it come from?
What chemical reaction takes place when borax is decomposed by hydrochloric acid?
How may the following impurities be detected?—viz.: sulphate; chloride; lead, copper, iron, etc.; calcium; sodium salt.
What are the uses of boric acid?
Silicon—Give symbol and atomic weight.
In what forms is silicon obtained?
In what combinations is it important, commercially?
How is it found in nature?
What is silica, and how may it be obtained pure?
Give the chemical reaction when official solution of sodium silicate is treated with hydrochloric acid.
What are the tests for silicates?
How is solution of sodium silicate prepared?
What is the usual strength of the solution?
For what is it used?

CHAPTER XXXVII

THE ALKALIES AND THEIR COMPOUNDS.

Potassium, Sodium, Lithium, and Ammonium.

K; 39.08. Na; 23. Li; 7.01. NH_4 ; 18.01.

THE alkalies are bodies having strongly-marked physical and chemical properties: 1. They combine with acids to form salts. 2. They restore the color of reddened litmus paper, and change the colors of vegetable blues to green, and of vegetable yellows to brown. 3. Their taste is never sour, but it is characteristic, and caustic if the alkali is in concentrated solution. The salts formed by their combinations with acids possess acid, alkaline, or neutral reactions according to the relative strength and proportion of the component parts.

The metals known as alkali-metals which form compounds of pharmaceutical interest are potassium, sodium, and lithium. They are all univalent, and of a white color resembling that of silver, and are so prone to oxidation that they must be kept constantly immersed in some carbo-hydrogen or body free from oxygen, like naphtha or petroleum. They are so soft that they can be easily cut with a penknife. They float upon water, and inflame spontaneously and immediately when brought in contact with it.

The alkali-metals are often called light metals, on account of their low specific gravity when compared with the others.

Their carbonates are all soluble in water, and each metal forms but one chloride.

Their oxides are strongly basic, restoring the color of reddened litmus quickly. The oxides are also very soluble in water, forming caustic and powerfully alkaline hydrates, which cannot be decomposed by heat.

Their sulphates, phosphates, nitrates, sulphides, chlorides, bromides, iodides, and nearly all their salts, are soluble in water, are almost without exception colorless, or of an opaque white color, and many of them, if heated to redness, fuse without decomposition.

The processes for obtaining the metals are very similar, and consist in exposing their carbonates, intimately mixed with finely-powdered charcoal, in suitable iron vessels, to an intense heat: carbon monoxide is liberated, and the vapors of the metals are condensed in flattened receivers.

Ammonium is a compound radical, NH_4 , but has so many analogies with the alkali-metals that it is classed with them.

CHAPTER XXXVIII.

THE POTASSIUM SALTS.

THE salts of potassium are among the most important of any that are used in medicine. They are generally very soluble, and, with a few exceptions, are colorless or of an opaque white color. The sole source of the potassium salts was formerly wood-ashes, but at present cheaper sources have been discovered. The wood-ashes were lixiviated, the liquid containing the soluble salts evaporated to dryness, and the residue allowed to cool. This constituted the crude *potash* of commerce.

Potash is now made from the ashes from beet-sugar residues, from *suint*, the residue obtained by evaporating the water used to scour the fleeces of sheep, and from an impure potassium chloride obtained from the Stassfurt mines in Germany, which is now the principal source of the potassium compounds.

The salts are converted into potassium sulphate, and this into carbonate by heating with coal and limestone. For the purpose of converting the sulphate into the carbonate, it is heated in a reverberatory furnace with the proper quantity of coal and limestone, with the coal in order to form potassium sulphide, and with the limestone to convert the sulphide into carbonate, the sulphur uniting with the calcium to form calcium sulphide. The mass, after cooling, is lixiviated with water, and this solution of impure potassium carbonate is filtered to separate the insoluble calcium sulphide, and subsequently treated with milk of lime, by which insoluble calcium carbonate is precipitated, and potassium hydrate in solution remains. The liquid is then evaporated to dryness.

Tests for Potassium Salts.

Potassium may be recognized in its combinations by the following tests :

1. The addition of platinic chloride with a little alcohol and a few drops of hydrochloric acid produces a yellow crystalline precipitate, PtCl_2KCl (double platinum and potassium chloride).

2. With an excess of a concentrated solution of tartaric acid, a white crystalline precipitate is slowly formed when a strong solution of a potassium salt is added with stirring. This is the well-known acid potassium tartrate (cream of tartar).

3. A colorless flame is tinted violet by pure potassium salts.

4. Potassium salts are soluble in water, and not volatile at a red heat.

Official Potassium Salts and Preparations.

Official Name.	Preparation.
With Inorganic Radicals.	
Potassa	From the ashes of plants, etc., by lixiviating, concentrating the solutions, evaporating to dryness, purifying by treating a dilute solution with lime, evaporating, fusing, and casting into moulds.
Potassa cum Calce	By mixing equal parts of well-dried potassa and lime together.
Liquor Potassæ	About 5 per cent. solution of potassium hydrate made by dissolving the hydrate in water.
Potassa Sulphurata	By melting potassa and sulphur together in a crucible, pouring the liquid on a slab, and cooling.
Potassii Bicarbonas	By passing carbon dioxide into a solution of carbonate, evaporating and crystallizing.
Potassii Bichromas	By treating potassium chromate with sulphuric acid, evaporating and crystallizing.
Potassii Bromidum	By treating solution of potassa with bromine and charcoal.
Potassii Carbonas	By purifying pearl-ash by dissolving it in water, filtering, evaporating, and granulating.
Potassii Chloras	By reacting on potassium chloride with calcium hypochlorite.
Potassii Cyanidum	By fusing potassium ferrocyanide with potassium carbonate, separating the insoluble precipitate of metallic iron, and pouring the fused mass on a slab.
Potassii Ferrocyanidum	By heating nitrogenized substances with iron and potassa.
Potassii Hypophosphis	By precipitating calcium hypophosphite with potassium carbonate.
Potassii Iodidum	By treating solution of potassa with iodine, evaporating to dryness, and heating with charcoal.
Potassii Nitras	By decomposition of sodium nitrate with potassium chloride.
Potassii Permanganas	By heating together manganese dioxide, potassium chlorate, and potassa.
Potassii Sulphas	By purifying the residue from nitric acid manufacture, and from other sources.
Liquor Potassii Arsenitis	By boiling potassium bicarbonate with arsenous acid, and adding a small quantity of compound tincture of lavender.
Trochisci Potassii Chloratis	Each troche contains five grains of potassium chlorate, with spirit of lemon, sugar, tragacanth, and sufficient water to form a mass.
With Organic Radicals.	
Potassii Acetas	By decomposing potassium bicarbonate with acetic acid, and evaporating the filtered solution, carefully avoiding contact with iron.
Potassii Bitartras	By purifying argols, the sediment deposited in wine-casks during fermentation.
Potassii Citras	By decomposing potassium bicarbonate with citric acid, evaporating and granulating.
Potassii Citras Effervescens	By powdering citric acid, potassium bicarbonate, and sugar together, drying the paste rapidly, and finally powdering.
Potassii et Sodii Tartras	By treating solution of potassium bitartrate with sodium carbonate.
Liquor Potassii Citratis	8 parts of potassium bicarbonate with 6 parts of citric acid in 100 parts of water.

Unofficial Potassium Salts and Preparations.

Names.	Preparation.
Potassii Antimonias, KSbO_3 . Potassium Antimoniate.	Deflagrating 1 p. metallic antimony with 4 p. potassium nitrate, and lixiviating with water.
Potassii Bisulphas, KHSO_4 . Potassium Bisulphate.	Residue remaining in retort on preparing nitric acid from potassium nitrate and sulphuric acid.
Potassii Bisulphias, KHSO_3 . Potassium Bisulphite.	Passing an excess of sulphurous acid gas into a concentrated solution of potassium carbonate.
Potassii Borotartras. Potassium Borotartrate.	Dissolve by heat 4 p. potassium bitartrate, and 1 p. boric acid in 10 p. water, and evaporate to dryness.
Potassii Chloridum, KCl . Potassium Chloride.	Obtained as a by-product in many salts.
Potassii Chromas, K_2CrO_4 . Potassium Chromate.	Add potassium carbonate to a hot solution of bi-chromate until effervescence ceases.
Potassii et Ammonii Tartras, $\text{KNH}_4\text{C}_4\text{H}_4\text{O}_6$. Potassium and Ammonium Tartrate.	Diffuse 1 p. potassium bitartrate in 3 p. boiling water; then add ammonium carbonate until effervescence ceases; filter and crystallize.
Potassii et Sodii Borotartras. Potassium and Sodium Borotartrate.	Dissolve 2 p. sodium borate in 20 p. distilled water, and digest with 5 p. potassium bitartrate.
Potassii Ferricyanidum, $\text{K}_3\text{Fe}(\text{C}_6\text{H}_5)_6$. Potassium Ferricyanide.	Pass chlorine gas into a cold solution of potassium ferrocyanide until it ceases to produce a blue precipitate with ferric chloride.
Potassii Iodas, KIO_3 . Potassium Iodate.	Pass chlorine gas into cold water containing iodine in suspension until wholly dissolved; then add potassium chlorate and warm. Dose, 4 to 8 grains (0.3 to 0.5 Gm.).
Potassii Iodohydrargyras, $(2\text{KI.HgI}_2)_3\text{H}_2\text{O}$. Potassium Iodohydrargyrate (Potassio-Mercurio Iodide).	Dissolve 3 p. mercuric iodide in a concentrated solution of potassium iodide containing 2 p. of the salt; when cool, yellow prisms will deposit from the mother-liquid. Dose, one-twelfth of a grain (0.005 Gm.).
Potassii Nitris, KNO_2 . Potassium Nitrite.	Made by heating the nitrate to redness and separating undecomposed nitrate; by dissolving the fused mass in water the nitrate will crystallize out; the mother-liquor is treated with diluted acetic acid and twice its volume of alcohol, to separate more nitrate. The nitrite may be obtained by evaporating the solution over sulphuric acid. Dose, 5 grains (0.194 Gm.).
Potassii Perchloras, KClO_4 . Potassium Perchlorate.	Heat potassium chlorate until it melts; keep at this temperature until gas ceases to be evolved, and a portion tested with strong HCl acquires only a faint yellow color. Purify.
Potassii Platincyanidum, $2\text{KCN.Pt}(\text{CN})_2$. 3H ₂ O. Potassium Platincyanide.	Mix concentrated solutions of 1 p. exsiccated platonic chloride and 2 p. potassium cyanide; heat until the precipitate is redissolved.
Potassii Pyrosulphias, $\text{K}_2(\text{SO}_3)_2$. Potassium Pyrosulphite.	Pass sulphurous acid gas into a warm, saturated solution of potassium carbonate; on cooling, it deposits crystals.
Potassii Salicylas, $(\text{KC}_7\text{H}_5\text{O}_2)_2.\text{H}_2\text{O}$. Potassium Salicylate.	Dissolve 7 p. potassium bicarbonate in water; then add gradually 10 p. salicylic acid, and evaporate.
Potassii Silicas, K_2SiO_3 . Soluble glass.	Fuse 10 p. potassium carbonate, 15 p. fine sand, and 1 p. charcoal.
Potassii Sulphidum, K_2S . Potassium Sulphide.	Pass hydrogen sulphide gas into a solution of potassa as long as it is absorbed, and add an equal bulk of potassa solution; evaporate.
Potassii Sulphis. Potassium Sulphite.	Pass sulphurous acid gas through a solution of potassium carbonate.
Potassii Sulphocarbonas, K_2CS_3 . Potassium Sulphocarbonate.	Mix a solution of potassium sulphide with carbon disulphide; on evaporation, orange-yellow crystals are deposited.
Potassii Sulphocyanas, KSCN . Potassium Sulphocyanate.	Melt together 17 p. potassium carbonate, 32 p. sulphur, and 46 p. anhydrous potassium ferrocyanide, and heat to low redness. When cool, treat with boiling alcohol.
Potassii Tartras. Potassium Tartrate.	By treating solution of potassium bitartrate with potassium carbonate.
Mistura Potassii Citratia, U.S. P. 1880. Neutral Mixture.	By neutralizing 100 parts of lemon juice with 10 parts of potassium bicarbonate.

POTASSA. U. S. Potassa.

KOH; 55.99.

[POTASSIUM HYDRATE. POTASSIUM HYDROXIDE. CAUSTIC POTASH.]

Preparation.—Potassa, called commercially caustic potash, is made by evaporating a solution of potassium hydrate rapidly in a silver or clean iron vessel until a fluid of oily consistence remains, a drop of which, when removed on a warm glass rod, solidifies on cooling. The hot caustic potassa is poured into cylindrical moulds, and while the sticks are still warm they are bottled quickly, to prevent deliquescence.

Pure caustic potassa is sometimes prepared in the form of powder by stirring the fused mass rapidly with a silver spatula until a granulated powder is formed. This must be placed in warm dry bottles and quickly sealed hermetically.

Potassa by Alcohol and *Potassa by Barytes* are terms used to designate pure caustic potassa made by purifying with alcohol and barium hydroxide, alcohol dissolving only the caustic potassa, whilst the sulphate is separated by treatment with baryta-water, forming the insoluble barium sulphate.

Potassa. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Dry, white, translucent pencils, or fused masses, hard and brittle, showing a crystalline fracture. Great caution is necessary in tasting and handling it, as it rapidly destroys organic tissues. Exposed to the air, it rapidly absorbs carbon dioxide and moisture, and deliquesces. When heated to about 530° C. (986° F.), Potassa melts to a clear, oily liquid, and at a bright red heat it is volatilized unchanged. When introduced into a non-luminous flame, it imparts to it a violet color.	Odorless, or having a faint odor of lye; very acrid and caustic taste; strongly alkaline reaction.	At 15° C. (59° F.), in about 0.5 part. Boiling, Very soluble.	At 15° C. (59° F.), 2 parts. Boiling, Very soluble.	Slightly soluble in ether.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
After acidulation with hydrochloric acid it yields bright yellow precipitates with platinum chloride T.S. and with sodium cobaltic nitrite T.S. A concentrated aqueous solution, when dropped into solution of tartaric acid, produces a white, crystalline precipitate, which is redissolved by an excess of solution of Potassa.	Organic Matter. Arsenic, Lead, etc. Iron, Aluminium, etc. Calcium. Chloride Limit.	An aqueous solution of Potassa should be colorless. If 1 Gm. of Potassa be dissolved in 10 C.c. of water, and slightly supersaturated with acetic acid, 10 C.c. of the solution should not be colored or rendered turbid by the addition of an equal volume of hydrogen sulphide T.S., Nor by the subsequent addition of ammonia water in slight excess. The remainder of the acidulated solution should not be rendered turbid by ammonium oxalate T.S. If a solution of 1.5 Gm. of Potassa in 10 C.c. of water be slightly supersaturated with nitric acid, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the addition of more silver nitrate V.S.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IDENTITY.
To neutralize 0.56 Gm. of Potassa should require not less than 9 C.c. of normal sulphuric acid (each C.c. corresponding to 10 per cent. of pure potassium hydrate), phenolphthalein being used as indicator.	Sulphate.	<p>If to a solution of 3.5 Gm. of Potassa in 10 C.c. of water, strongly supersaturated with hydrochloric acid, 0.1 C.c. of barium chloride T.S. be added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.</p> <p>If 1 Gm. of Potassa be dissolved in 2 C.c. of water, and added to 10 C.c. of alcohol, not more than a slight, colorless precipitate should occur within ten minutes.</p> <p>After boiling this alcoholic solution with 5 C.c. of calcium hydrate T.S. and filtering, not the slightest effervescence should take place on adding the filtrate to an excess of diluted hydrochloric acid.</p> <p>If 0.2 Gm. of Potassa be dissolved in 2 C.c. of water, and carefully mixed with 4 C.c. of pure sulphuric acid and 2 drops of indigo T.S., the blue color should not be discharged.</p> <p>To test for <i>soda</i>, dissolve 0.56 Gm. of Potassa in 5 C.c. of water, add a few drops of phenolphthalein T.S., and then, from a burette, enough tartaric acid T.S. (3 Gm. in 20 C.c.) to accurately neutralize the solution. Next add another volume of the tartaric acid T.S. equal to that first used, and then enough absolute alcohol to completely precipitate the potassium bitartrate formed. Separate the precipitate by filtration, and wash it with a little alcohol. The filtrate should not require more than 0.2 C.c. of normal potassium hydrate V.S. to restore the red color.</p>
	Silicate.	
	Carbonate.	
	Nitrate.	
	More than 1.5 per cent. of Soda.	

Uses.—Potassa is used as a caustic, principally, however, in veterinary practice: the end of the stick may be wrapped several times with tin-foil, to avoid cauterizing the finger of the operator. When this form of potassium hydrate is used for making official solution of potassa, care should be taken to allow for the moisture contained in it: commercial caustic potassa rarely contains less than 30 per cent. of water.

POTASSA CUM CALCE. U.S. Potassa with Lime.

	Metric.	Old form.
Potassa	500 Gm.	1 oz. av.
Lime	500 Gm.	1 oz. av.
To make	1000 Gm.	2 oz. av.

Rub them together, in a warm iron mortar, so as to form a powder, and keep it in a well-stoppered bottle.

This preparation is a grayish-white powder, deliquescent, having a strongly alkaline reaction, and responding to the tests for calcium and potassa. It should be soluble in hydrochloric acid without leaving more than a small residue. It should not effervesce on the addition of an acid. It is found in commerce moulded into sticks, which are often more convenient than the powdered form, because less deliquescent.

Uses.—Potassa with lime is used medicinally for the same purposes as caustic potassa: it is slower in its operation and more manageable than the latter.

LIQUOR POTASSÆ. U. S. Solution of Potassa.

[SOLUTION OF POTASSIUM HYDRATE.]

An aqueous solution of Potassium Hydrate [$\text{KOH} = 55.99$], containing about 5 per cent. of the hydrate.

	Metric.	Old form.
Potassium Bicarbonate	85 Gm.	2 oz. av. 410 gr.
Lime	40 Gm.	1 oz. av. 166 gr.
Distilled Water, a sufficient quantity.		

Dissolve the Potassium Bicarbonate in 400 C.c. [old form 12½ fl. oz.] of Distilled Water, heat the solution until effervescence ceases, and then increase the heat to the boiling point of the liquid. Slake the Lime with about 20 C.c. [old form 5 fl. dr.] of Distilled Water, then mix it well with 400 C.c. [old form 12½ fl. oz.] of Distilled Water, pour the mixture into a tared flask, and, having heated it to boiling, gradually add to it the solution of Potassium Bicarbonate, and boil during ten minutes. Then add enough Distilled Water to the flask to make the contents weigh 1000 Gm. [old form 2 pints], and set the flask aside, well stoppered, until the contents are cold. Lastly, strain the liquid through linen, set it aside in a well-stoppered bottle until it has become clear by subsidence, and separate the clear solution by decantation, or by means of a siphon.

Solution of Potassa may also be prepared in the following manner :

Alternative Process.

	Metric.	Old form.
Potassa	56 Gm.	1 oz. av.
Distilled Water	944 Gm.	1 pint.
To make	1000 Gm.	about 1 pint.

Dissolve the Potassa in the Distilled Water.

The Potassa used in this process should be of the full strength directed by the Pharmacopœia (90 per cent.). Potassa of any other strength, however, may be used, if a proportionately larger or smaller quantity be taken; the proper amount for the above formula being ascertained by dividing 5000 by the percentage of absolute Potassa (potassium hydrate) contained therein.

Solution of potassa should be kept in bottles made of green glass and provided with glass stoppers coated with paraffin or petrolatum.

The potassium hydrate is obtained in the first formula by decomposing potassium bicarbonate through the action of calcium hydrate and heat. The direction to heat the solution of potassium bicarbonate until effervescence ceases is for the purpose of driving off as much of the carbonic acid as possible by the simplest method: the remainder is disposed of through double decomposition, as shown by the equation

Preference is given to the bicarbonate as the source of the potassium, because the cheaper carbonates nearly always contain silicates and other impurities in sufficient quantities to render the product inferior.

The proportion of water is not a matter of indifference. The quantity used should be at least five times as great as that of the bicarbonate, and the lime must greatly exceed the amount indicated by theory. The sparing solubility of the lime sufficiently accounts for this.

It is advisable to strain the solution as rapidly as possible, merely to separate the bulk of the lime, and set it aside in tightly-covered jars until all sediment has deposited, and then decant the clear solution. This plan avoids the injurious contact of the air, by which carbonic acid is absorbed.

In the alternative formula ready-made potassa is used by simply dissolving it in water, the only advantages being those of greater convenience and the saving of labor and time.

Liquor Potassæ. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A clear, colorless liquid. Sp. gr. about 1.036 at 15° C. (59° F.).	Odorless; very acrid and caustic taste; strongly alkaline reaction.	Miscible in all proportions with water and alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

It should conform to the same reactions and tests as an aqueous solution of Potassa. (See Potassa.)

To neutralize 28 Gm. of Solution of Potassa should require about 25 C.c. of normal sulphuric acid V.S. (each C.c. of the volumetric solution indicating 0.2 per cent. of absolute potassium hydrate), phenolphthalein being used as indicator.

Uses.—Solution of potassa is a valuable antacid when given in doses of twenty minims (1.2 C.c.), diluted with milk. If a large quantity should be swallowed accidentally, the proper antidotes would be mild acid liquids, like vinegar or lemon-juice, accompanied with bland oils.

POTASSA SULPHURATA. U.S. Sulphurated Potassa.

[LIVER OF SULPHUR.]

	Metric.	Old form.
Sublimed Sulphur	100 Gm.	1 oz. av.
Potassium Carbonate, dried	200 Gm.	2 oz. av.
		8 oz. av.

Mix the powdered and dried Potassium Carbonate thoroughly with the Sublimed Sulphur, and gradually heat the mixture, in a covered crucible, which should be only about half filled with it, until the mass ceases to foam and is in a state of perfect fusion. Then pour the fused mass on a cold marble slab, and, after it has cooled, break it into pieces, and keep it in a well-stoppered bottle.

This preparation is not a definite chemical compound, as shown by its vague official name and the absence of a chemical formula. It is sometimes called *liver of sulphur*, and is a mixture of potassium hyposulphite and potassium sulphide, with probably some potassium pentasulphide

and traces of undecomposed potassium carbonate. The effervescence is caused by the escape of carbonic acid gas.

This preparation should be *made by the pharmacist* in small quantities and dispensed in a fresh condition, as it is impossible to prevent deterioration. Potassium sulphide, which is its principal medicinal constituent, is converted, through oxidation, into inert potassium sulphate.

Potass Sulphurata. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Irregular pieces of a liver-brown color when freshly prepared, turning gradually to greenish-yellow or brownish-yellow. The aqueous solution has an orange-yellow color and exhales the odor of hydrogen sulphide. The latter is abundantly evolved on the addition of acetic acid, while at the same time sulphur is deposited.	Faint, disagreeable odor; bitter, alkaline, repulsive taste; alkaline reaction.	2 parts, with the exception of a small residue.	Partly soluble in alcohol, leaving undissolved the accompanying impurities.
TEST.	QUANTITATIVE TEST.		
If a solution of the salt be boiled with an excess of hydrochloric acid, until no more hydrogen sulphide is given off, the cold filtrate, after being neutralized with soda, yields a white crystalline precipitate with a saturated solution of sodium bitartrate.	On triturating together 1 Gm. of Sulphurated Potassa and 1 Gm. of crystallized copper sulphate with 10 C.c. of water, and filtering, the filtrate should remain unaffected by hydrogen sulphide T.S., corresponding to at least 12.85 p.c. of sulphur combined with potassium to form sulphide.		

The addition of the solution of sodium bitartrate identifies the potassium salt by forming a white, crystalline precipitate of potassium bitartrate. The quantitative test depends for its action upon the decomposition of a certain amount of cupric sulphate. If the official percentage of potassium sulphide is present, the quantity of copper in the cupric sulphate taken will be entirely converted into sulphide, so that no discoloration will be caused by the addition of hydrogen sulphide.

Uses.—Sulphurated potassa is sometimes given internally, in five-grain doses (0.3 Gm.). It is generally used externally, in skin diseases.

POTASSII ACETAS. U.S. Potassium Acetate.

Preparation.—This salt may be made by adding crystals of potassium bicarbonate to pure acetic acid until effervescence ceases, and, after acidulating slightly with a few drops of the acid, cautiously evaporating to dryness in a porcelain capsule by means of a sand-bath.

Great care is necessary to avoid contamination with iron, and it is not safe to use an enamelled iron dish.

The manufacturer nearly always uses the carbonate in making potassium acetate, instead of the bicarbonate, because it is much cheaper. The product from the carbonate is not apt to be pure, however, because of the silica, sulphate, chlorides, etc., always present in the ordinary carbonate.

Potassi Acetas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white powder, or crystalline masses of a satiny lustre, very deliquescent on exposure to the air. When heated to 292° C. (557.6° F.), the salt fuses. At a higher temperature it decomposes, blackens, and evolves vapors having an empyreumatic odor (an alliaceous odor would indicate the presence of <i>arsenic</i>), and finally leaves a white residue of potassium carbonate, which should be completely soluble in water.	Odorless; warming, saline taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 0.36 part. Boiling, Very soluble.	At 15° C. (59° F.), 1.9 parts. Boiling, Very soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
On the addition of sodium cobaltic nitrite T.S., a copious yellow precipitate is formed.	Arsenic, Lead, etc.	Having prepared a solution of 2.5 Gm. of the salt in 50 C.c. of water, use 10 C.c. of it for each of the following tests:
The addition of sodium bitartrate T.S. to the aqueous solution causes a white crystalline precipitate. When the salt is heated with a small amount of sulphuric acid, vapors of acetic acid are evolved.		After a portion has been acidulated with a few drops of hydrochloric acid, the addition of an equal volume of hydrogen sulphide T.S. should produce no precipitate.
The addition of a little ferric chloride T.S. to a solution of the salt produces a deep red color, and, upon the application of heat, a pale brown, flocculent precipitate of basic ferric acetate separates.		In another portion, acidulated with hydrochloric acid, 1 C.c. of barium chloride T.S. should produce no visible change.
If 1 Gm. of Potassium Acetate be, by thorough ignition, converted into carbonate, the residue should require, for complete neutralization, not less than 10 C.c. of normal sulphuric acid (corresponding to at least 98 per cent. of pure Potassium Acetate), methyl-orange being used as indicator.		If to a portion of the solution, acidulated with nitric acid, 0.1 C.c. of decinormal silver nitrate V.S. be added, the liquid should, after filtration, show no further change on the addition of more silver nitrate V.S.
		Addition of 0.3 C.c. of potassium ferrocyanide T.S. should effect no change in the solution within fifteen minutes.
	Iron.	No coloration or precipitate should be produced by adding 1 C.c. of ammonium sulphide T.S.
	Iron, Aluminum, etc.	Fragments of the salt, sprinkled upon sulphuric acid, should produce no effervescence,
	Carbonate.	Nor impart any color.
	Readily Carbonizable Organic Impurities.	

Uses.—Potassium acetate is a reliable diuretic when given in doses of twenty grains to one drachm (1.2 to 3.7 Gm.). In larger doses it acts as a cathartic.

POTASSII BICARBONAS. U.S. Potassium Bicarbonate.

Preparation.—This salt is made by passing carbon dioxide through a solution of potassium carbonate until it is fully saturated, then filtering the liquid, and evaporating at a temperature below 71° C. (160° F.) to prevent decomposition. The crystals formed should be well washed and dried.

The cheapest way to make this salt is to suspend a dish containing a concentrated solution of potassium carbonate within the fermenting tuns of a brewery: the carbon dioxide produced during fermentation is thus utilized. The crude salt obtained on evaporation is called *Salaratus*. When purified by crystallization, it constitutes the official bicarbonate.

Potassii Bicarbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, permanent in dry air. The dry salt begins to lose carbon dioxide at 100° C. (212° F.), and this loss increases at a higher temperature, until, at a red heat, the salt has lost 30.97 per cent. of its original weight, leaving a residue of carbonate.	Odorless; saline and slightly alkaline taste. The pure salt when dissolved in water is at first neutral to litmus paper and to phenolphthalein T.S., but the solution soon becomes feebly alkaline by partial conversion of the salt into carbonate.	At 15° C. (59° F.), 3.2 parts, and in 1.9 parts at 50° C. (122° F.). At a higher temperature the solution rapidly loses carbon dioxide, and, after being boiled, contains only potassium carbonate. Decomposed by boiling water.	Almost insoluble.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.	
Sodium cobaltic nitrite T.S. produces in the aqueous solution a copious yellow precipitate. Tartaric acid T.S., added to the aqueous solution in excess, causes a white crystalline precipitate. To neutralize 1 Gm. of Potassium Bicarbonate should require 10 C.c. of normal sulphuric acid (corresponding to 100 per cent. of the pure salt), methyl-orange being used as indicator.	Limit of Carbonate. Metallic Impurities. Limit of Iron. Limit of Chloride.	<p>A solution of 0.5 Gm. of Potassium Bicarbonate in 10 C.c. of water should not at once be colored red by one drop of phenolphthalein T.S. Dissolve 2.5 Gm. of the salt in 30 C.c. of diluted acetic acid, and, having made up the volume to 50 C.c. with water, use 10 C.c. for each of the following tests:</p> <p>No visible change should occur in a portion of this solution upon the addition of an equal volume of hydrogen sulphide T.S.</p> <p>The addition of 0.3 C.c. of potassium ferrocyanide T.S. to another portion should not produce a blue color within fifteen minutes.</p> <p>After adding a few drops of nitric acid and 0.1 C.c. of decinormal silver nitrate V.S. to another portion, and filtering, the further addition of silver nitrate V.S. should not affect the filtrate.</p>	

Uses.—This salt is largely used as affording the purest available source of the potassium salts. The large quantity of carbonic acid which it yields on decomposition renders it useful in beverages and

laxative draughts, such as solution of magnesium citrate. It is milder than the carbonate, and when administered internally it is more acceptable to the stomach. The dose is from fifteen to thirty grains (0.9 to 1.8 Gm.).

POTASSII BICHROMAS. U.S. Potassium Bichromate.

[POTASSIUM DICHROMATE.]

Preparation.—The source of this salt is *chrome iron ore*, which is found in several localities, notably in the neighborhood of Baltimore, Md. The ore is first roasted, then powdered, mixed with potassium carbonate and chalk, and the mixture heated strongly with access of air. The iron and chromium are both oxidized to ferric oxide and chromic acid; the latter attacks the potassium carbonate, and causes an evolution of carbon dioxide by combining with the potassium and forming neutral potassium chromate.

The solution of the latter is treated with an acid, usually sulphuric, but nitric acid would be preferable on some accounts, potassium nitrate being more readily separated from potassium bichromate than potassium sulphate. Sulphuric acid, however, is cheaper.

then

This salt is sometimes called potassium dichromate, and is considered to be a compound of potassium chromate with chromic anhydride, $\text{K}_2\text{CrO}_4\text{CrO}_3$.

Potassii Bichromas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Large, orange-red, transparent, four-sided triclinic prisms, permanent in the air. The salt fuses below a red heat, forming a dark brown liquid, without loss of weight.	Odorless; bitter, metallic taste; acid reaction.	At 15° C. (59° F.), 10 parts. Boiling, 1.5 parts.	Insoluble.

TESTS FOR IDENTITY.

At a white heat it evolves oxygen and leaves a residue of neutral potassium chromate and green chromic oxide.

On mixing 4 C.c. of the aqueous solution with 0.5 C.c. of alcohol, and then with 1 C.c. of sulphuric acid, the liquid will assume a green color and emit the odor of aldehyde.

Sodium cobaltic nitrite T.S. produces in the aqueous solution a copious yellow precipitate.

Uses.—This salt is used in the preparation of chromic and valerianic acids, and for forming an official test-liquid, the value of which as an indicator depends upon its yielding its oxygen to acid liquids (see Test-

Liquids). When given internally, in large doses, it is an irritant poison: the proper dose is one-fifth of a grain (0.013 Gm.): soap, magnesia, or chalk would be a suitable antidote.

POTASSII BITARTRAS. U.S. Potassium Bitartrate.

[CREAM OF TARTAR.]

Preparation.—This well-known salt is made by purifying *argols*, or *tartar*, a substance deposited in wine-casks during the fermentation of the grape-juice. (See Acid Saccharine Fruits, Part IV.)

Potassii Bitartras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless or slightly opaque, rhombic crystals, or a white, somewhat gritty powder, permanent in the air. When heated on platinum foil, the salt chars and evolves inflammable vapors having the odor of burnt sugar.	Odorless; pleasant acidulous taste; acid reaction.	At 15° C. (59° F.), 201 parts. Boiling, 16.7 parts.	Very slightly soluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The odor of ammonia should not be evolved on heating the salt with a slight excess of potassium or sodium hydrate T.S.</p> <p>If 1.88 Gm. of Potassium Bitartrate be thoroughly ignited at a red heat, it should require for complete neutralization not less than 9.9 C.c. of normal sulphuric acid V.S. (each C.c. corresponding to 10 per cent. of the purer salt), phenolphthalein being used as indicator. When heated strongly, with free access of air, the carbon of the black residue is oxidized, and a white fused mass of potassium carbonate remains, which has an alkaline reaction, and effervesces strongly with acids.</p> <p>With sodium cobaltic nitrite T.S. it yields a copious yellow precipitate.</p> <p>In the aqueous solution of the salt, rendered neutral by potassium or sodium hydrate T.S., silver nitrate T.S. produces a white precipitate which, on boiling, becomes black by the separation of metallic silver. If, before applying heat, enough ammonia water be added to dissolve the white precipitate, upon boiling the solution a mirror will be deposited on the sides of the test-tube.</p>	<p>Chloride.</p> <p>Sulphate.</p> <p>Insoluble Matter.</p> <p>Copper, Lead, Iron, etc.</p> <p>Limit of Calcium Salt.</p>	<p>If 1.5 Gm. of the salt be shaken with 30 C.c. of water and the mixture filtered, 10 C.c. of the filtrate, after being acidulated with nitric acid, should not be rendered turbid by 0.5 C.c. of silver nitrate T.S.,</p> <p>Nor by 0.5 C.c. of barium chloride T.S.</p> <p>A solution of 0.5 Gm. of the salt in 3 C.c. of ammonia water should leave no insoluble residue,</p> <p>Nor be affected by ammonium sulphide.</p> <p>If 1.2 Gm. of Potassium Bitartrate be repeatedly agitated, during half an hour, with a mixture of 5 C.c. of acetic acid and 1 C.c. of water, and the mixture be then diluted with 30 C.c. of water, and filtered, the clear filtrate should not be rendered turbid, within one minute, by the addition of 0.5 C.c. of ammonium oxalate T.S.</p>

Calcium tartrate is always present in grape-juice, and it is permitted by the official test in potassium bitartrate if not in greater proportion than 1 per cent.

Uses.—This salt is the source of tartaric acid and some of the tartrates. It is one of the ingredients in compound powder of jalap, and

is frequently used as a refrigerant and purgative in doses of one to four drachms (3.8 to 15.5 Gm.)

POTASSII BROMIDUM. U. S. Potassium Bromide.

KBr; 118.79.

Preparation.—Two methods are used in making this salt. In the one which was formerly official, ferrous bromide, made by acting on iron with bromine, is treated with potassium carbonate; ferrous carbonate precipitates, and potassium bromine remains in solution. The latter is filtered and evaporated, that crystals may form.

In the other method, bromine is added to solution of potassa, producing potassium bromide and bromate. The solution is evaporated to dryness, mixed with charcoal, and heated to redness. The bromate is deoxidized and converted into bromide, carbon monoxide escaping.

Formerly this salt was imported. It is now made in the United States upon a large scale, and is exported.

Potassii Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless or white, cubical crystals, or granules, permanent in air. On heating the salt upon platinum foil, it decrepitates; near 700° C. (1290° F.) it fuses without decomposition, and at a bright-red heat it volatilizes, communicating a violet color to the flame.	Odorless; pungent, saline taste; neutral or slightly alkaline reaction.	At 15° C. (59° F.), 1.6 parts. Boiling, 1 part.	At 15° C. (59° F.), 200 parts. Boiling, 16 parts.	Soluble in 4 parts of glycerin.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
The addition of tartaric acid T.S., or of sodium bitartrate T.S., produces in it, after some time, a white crystalline precipitate.	Limit of Potassium Carbonate.	If 1 Gm. of the salt be dissolved in 10 C.c. of a mixture of 100 C.c. of water and 0.2 C.c. of normal sulphuric acid, no red tint should be imparted to the solution by the addition of a few drops of phenolphthalein T.S. If a little of the salt be held in a non-luminous flame, on a perfectly clean platinum wire, the flame should be colored violet at once, without any appearance of yellow. If diluted sulphuric acid be dropped upon crushed crystals of the salt, they should not at once assume a yellow color.
Sodium cobaltio nitrite T.S. produces in it at once a copious yellow precipitate.	Sodium.	
	Bromate.	

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
If to 10 C.c. of the aqueous solution of the salt a few drops of chloroform be added, then 1 C.c. of chlorine water, and the mixture be agitated, the liberated bromine will dissolve in the chloroform, imparting to it a yellow or brownish-yellow color without a violet tint.	Iodine.	If 10 C.c. of the aqueous solution (1 in 20) be mixed with a little starch T.S., the addition of a few drops of chlorine water should not produce a blue color.
	Iron, Aluminum, etc.	Ten C.c. of the aqueous solution (1 in 12) should not be rendered turbid by the addition of 0.5 C.c. of ammonia water and of 0.5 C.c. of ammonium sulphide T.S.
	Arsenic, Lead, Copper, etc.	Nor should 10 C.c., after being slightly acidulated with acetic acid, be rendered turbid by an equal volume of hydrogen sulphide T.S.,
	Calcium.	Nor by 0.5 C.c. of ammonium oxalate T.S.,
	Barium.	Nor by 0.5 C.c. of potassium sulphate T.S.,
	Sulphate.	Nor by 0.5 C.c. of barium chloride T.S.,
	Iron.	Nor be colored blue by 0.5 C.c. of potassium ferrocyanide T.S.
	More than 2 per cent. of Chloride.	If 0.5 Gm. of the well-dried salt be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should not require more than 42.85 C.c. of decinormal silver nitrate V.S. to produce a permanent red color of silver chromate.

The official test to indicate the presence of more than 2 per cent. of chloride depends upon the formation of red argentic chromate, which does not take place until after all the chlorine has entered into combination with the silver.

Uses.—Potassium bromide is largely used as a nervine, in doses of twenty grains (1.2 Gm.), frequently repeated.

POTASSII CARBONAS. U.S. Potassium Carbonate.

K_2CO_3 ; 137.91.

Preparation.—This salt, known commercially as *Sal Tartar*, is made by dissolving *pearlash*, or impure potassium carbonate, in an equal weight of *cold water*, allowing the mixture to stand a day or two, filtering the solution, pouring it into a bright iron dish, and evaporating over a gentle fire until it thickens, then removing it from the fire and stirring constantly with an iron spatula, so as to form a granular salt (see page 249).

A purer carbonate is produced by decomposing potassium bicarbonate by heating to redness, thus driving off water of crystallization and a portion of the carbon dioxide.

Potassii Carbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, granular powder, very deliquescent. When heated to 130° C. (266° F.), the salt loses all its water. At a bright red heat it melts, and at a white heat it volatilizes, communicating to the flame a pure violet color. The aqueous solution strongly effervesces on the addition of acids, and with an excess of tartaric acid produces a white, crystalline precipitate, and with sodium cobaltic nitrite T.S. a copious yellow precipitate is formed at once.	Odorless; strongly alkaline taste; alkaline reaction.	At 15° C. (59° F.), 1.1 parts. Boiling, 0.65 part.	Insoluble.

QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
To neutralize 0.69 Gm. of Potassium Carbonate should require not less than 9.5 C.c. of normal sulphuric acid (each C.c. corresponding to 10 per cent. of the pure salt), methyl - orange being used as indicator.	Sodium.	When a small portion of the salt, treated with a drop of hydrochloric acid, is introduced into a non-luminous flame on a perfectly clean platinum wire, the flame should be colored violet at once, without any appearance of yellow.
	Earthy Impurities.	No residue should be left on dissolving 1 Gm. of the salt in 20 C.c. of water.
	Metallic Impurities.	No precipitate or coloration should be produced in the aqueous solution (1 in 20) by an equal volume of hydrogen sulphide T.S.
	Hyposulphite.	On neutralising the solution with hydrochloric acid, no odor of burning sulphur, nor any white precipitate, should appear.
	Nitrate.	If 2 C.c. of the aqueous solution (1 in 20) be carefully mixed with an equal volume of concentrated sulphuric acid, and, after cooling, 1 C.c. of ferrous sulphate T.S. be poured upon it so as to form a separate layer, no brown color should appear at the line of contact.
	Sulphate.	If 0.5 Gm. of Potassium Carbonate be dissolved in 5 C.c. of diluted hydrochloric acid and 5 C.c. of water, the addition of 1 C.c. of barium chloride T.S. should not produce any turbidity.
	Iron.	A solution of 0.5 Gm. of the salt in 5 C.c. of diluted hydrochloric acid mixed with 5 C.c. of water should not be colored blue within fifteen minutes by 0.3 C.c. of potassium ferrocyanide T.S.
	Chloride.	If 0.5 Gm. of the salt be dissolved in 6 C.c. of diluted nitric acid and 4 C.c. of water, then 0.1 C.c. of decinormal silver nitrate V.S. be added, and the mixture filtered, no change should be produced in the filtrate by the further addition of silver nitrate V.S.
	Cyanide.	If 10 C.c. of the aqueous solution (1 in 20) be mixed with 2 drops, each, of ferrous sulphate T.S. and ferric chloride T.S., the mixture heated, and slightly supersaturated with hydrochloric acid, no blue color should appear.
	Sulphide.	The addition of a few drops of lead acetate T.S. to the aqueous solution should produce a pure white precipitate.

Uses.—Potassium carbonate is an antacid, but it is less agreeable than the bicarbonate. The dose is fifteen grains (0.9 Gm.), largely diluted. In large doses it is an irritant caustic, the proper antidotes to administer being diluted vinegar, lemon-juice, or weak acids.

POTASSII CHLORAS. U. S. Potassium Chlorate.

KClO_3 ; 122.28.

Preparation.—Chlorate of potash, as it is always termed commercially, was formerly made by passing chlorine gas into a solution of potassa. This is a very wasteful process, as only one-fifth of the potassa is obtained as chlorate, the rest passing into potassium chloride. It is now more economically prepared by boiling together solutions of potassium chloride and calcium hypochlorite, whereby potassium chlorate and calcium chloride are produced.

When a solution of calcium hypochlorite is boiled, it is decomposed, and calcium chlorate and calcium chloride are formed :

When solution of calcium chlorate is heated in contact with potassium chloride, double decomposition takes place, as shown by the following equation :

The potassium chlorate is easily separated from the calcium chloride, because it is much less soluble than the latter.

Potassii Chloras. U. S.		ODOR, TASTE, AND REACTION.		SOLUBILITY.	
				Water.	Alcohol.
Colorless, lustrous, monoclinic prisms or plates, or a white powder, permanent in the air. At 234° C. (453.2° F.) the salt fuses, and above 352° C. (665.6° F.) it is decomposed into oxygen and potassium perchlorate; above 400° C. (752° F.) all its oxygen is liberated, and a white residue of potassium chloride remains, amounting to 60.8 per cent. of the chlorate employed. This residue is readily soluble in water, and the solution yields a white, curdy precipitate with silver nitrate T.S.		Odorless; cooling saline taste; neutral reaction.		At 15° C. (59° F.), 16.7 parts. Boiling, 1.7 parts.	Insoluble in absolute alcohol. Slightly soluble in mixtures of alcohol and water.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.			
With excess of tartaric acid T.S. the solution slowly yields a scant, white, crystalline precipitate; with sodium cobaltic nitrite T.S., or with platinum chloride T.S., a copious yellow precipitate is produced at once.	Sodium.	{ When introduced into a non-luminous flame on a clean platinum wire, Potassium Chlorate communicates to the flame a pure violet color, without admixture of yellow. Separate portions, each of 5 C.c., of the aqueous solution (1 in 20) should not be rendered turbid by 0.5 C.c. of barium chloride T.S., Nor by 0.5 C.c. of ammonium oxalate T.S., Nor by 0.5 C.c. of silver nitrate T.S.			
	Sulphate.				
	Calcium Chloride.	{ Nor should an equal volume of hydrogen sulphide T.S. produce either a precipitate or a coloration. If a mixture of 1 Gm. of the salt with 0.5 Gm., each, of iron and of zinc, in coarse powder or filings, be heated with 5 C.c. of potassium hydrate T.S., no evolution of ammonia should be perceptible either by moistened red litmus paper or by odor.			
	Metals.				
When heated with hydrochloric acid, the aqueous solution assumes a greenish-yellow color, and evolves chlorine.	Nitrate or Nitrite.				

Potassium chlorate should not be triturated with readily oxidizable or combustible substances, if explosions are to be avoided.

Uses.—Potassium chlorate is used chemically as a source for obtaining oxygen, and medicinally is largely employed in diphtheria, sore throat, scarlet fever, etc., in doses of ten to twenty grains (0.6 to 1.2 Gm.).

POTASSII CITRAS. U. S. Potassium Citrate.

Preparation.—This salt is made by adding potassium bicarbonate to a solution of citric acid until effervescence ceases, filtering the solution, evaporating to dryness, and granulating (see page 249).

Manufacturers generally use the carbonate as the source of the potassium, as it is much cheaper than the bicarbonate. When carelessly made from the carbonate, silica may be present, which is to be suspected if the potassium citrate is not entirely soluble in water.

Potassii Citras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Transparent, prismatic crystals, or a white, granular powder, deliquescent on exposure to air. When heated above 100° C. (212° F.), the salt begins to lose water; at 200° C. (392° F.) the water of crystallization (5.55 per cent.) is completely lost; at 230° C. (446° F.) the salt begins to decompose, turns brown, and at a higher temperature carbonizes, and emits inflammable gases which have a very pungent, acid odor. At a red heat a blackened mass of potassium carbonate and carbon is left, which has an alkaline reaction, and strongly effervesces with acids.	Odorless; slightly cooling, saline taste; neutral reaction.	At 15° C. (59° F.), 0.6 part. Boiling, Very soluble.	Very slightly soluble.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.	
The salt yields a white, crystalline precipitate with sodium bitartrate T.S. On mixing 10 C.c. of the aqueous solution (1 in 20) with 2.5 C.c. of calcium chloride T.S., the liquid remains clear until it is boiled, when a white, granular precipitate is produced. If 1.08 (1.079) Gm. of Potassium Citrate be thoroughly ignited at a red heat, it should require for complete neutralization not less than 10 C.c. of normal sulphuric acid (corresponding to 100 per cent. of the pure salt), methyl-orange being used as indicator.	Carbonate. Sulphate and Chloride. Tartrate.	{ The aqueous solution (1 in 20) should not be colored red by a drop of phenolphthalein T.S., nor effervesce on the addition of an acid. Separate portions of this solution acidulated with nitric acid should not be affected by barium chloride T.S., nor by silver nitrate T.S. A solution of 1 Gm. of Potassium Citrate in 1 C.c. of water should not deposit any precipitate on the addition of 1 C.c. of acetic acid.	

Uses.—Potassium citrate is principally employed in medicine as a diaphoretic, in doses of twenty grains (1.2 Gm.). It is found in the official solution of potassium citrate.

POTASSII CITRAS EFFERVESCENS. U. S. Effervescent Potassium Citrate.

	Metric.	Old form.
Citric Acid	63 Gm.	126 grains.
Potassium Bicarbonate	90 Gm.	180 grains.
Sugar	47 Gm.	94 grains.

Powder the ingredients separately, and mix them thoroughly in a warm mortar. Dry the resulting, uniform paste rapidly at a temperature not exceeding 120° C. (248° F.), and, when it is perfectly dry, reduce it to a powder of the desired degree of fineness. Keep the product in well-stoppered bottles.

Uses.—This forms an agreeable diaphoretic given in cold water in doses of thirty to sixty grains (1.9 to 3.8 Gm.).

LIQUOR POTASSII CITRATIS. U.S. Solution of Potassium Citrate.**[MISTURA POTASSII CITRATIS.]**

An aqueous liquid, containing in solution about 9 per cent. of anhydrous Potassium Citrate [$K_2C_6H_5O_7 = 305.63$], together with small amounts of citric and carbonic acids.

	Metric.	Old form.
Potassium Bicarbonate	8 Gm.	480 grains.
Citric Acid	6 Gm.	360 grains.
Water, a sufficient quantity.		

Dissolve the Potassium Bicarbonate and the Citric Acid, each, in 40 C.c. [old form 5½ fl. oz.] of Water. Filter the solutions separately, and wash the filters with enough Water to obtain, in each case, 50 C.c. [old form 6½ fl. oz.]. Finally, mix the two solutions, and, when effervescence has nearly ceased, transfer the liquid to a bottle.

For this preparation it will be found convenient in dispensing practice to keep the separate solutions of Citric Acid and Potassium Bicarbonate on hand ready to be mixed when the solution of potassium citrate is needed. The solutions keep moderately well. It is officially described as a clear, colorless liquid, odorless, having a mildly saline taste and a slightly acid reaction. The solution contains about 9 per cent. of potassium citrate, with some free Citric Acid and carbonic acid gas. It responds to the reactions and tests of potassium citrate (see *Potassii Citras*).

Neutral Mixture is a more agreeable preparation than this solution. It is made by nearly saturating lemon-juice with Potassium Bicarbonate. It was official in the U.S.P. 1880 under the name of *Mistura Potassii Citratia*.

Uses.—Solution of potassium citrate is refrigerant and diaphoretic, in doses of 1 fluidrachm (3.7 C.c.).

POTASSII CYANIDUM. U.S. Potassium Cyanide.

KCN; 65.01.

Preparation.—A process for making this salt was formerly official. It is as follows: Take of Ferrocyanide of Potassium, dried, 8 troy-ounces; Pure Carbonate of Potassium, dried, 3 troyounces. Mix the salts intimately, and throw the mixture into a deep iron crucible previously heated to redness. Maintain the temperature until effervescence ceases, and the fused mass concretes, of a pure white color, upon a warm glass rod dipped into it. Then pour out the liquid carefully into a shallow dish to solidify, ceasing to pour before the salt becomes contaminated with the precipitated iron. Break up the mass while yet warm, and keep the pieces in a well-stopped bottle.

The reaction between the potassium ferrocyanide and the potassium carbonate results in the production of potassium cyanide, potassium cyanate, iron, and carbon dioxide. The iron is precipitated out in the form of a fine powder, carbon dioxide escapes, and potassium cyanide, with a small proportion of cyanate, is produced.

Potassium cyanide is found in commerce of several qualities. The cheapest grade is used for mining and metallurgical processes and in the arts. A granulated salt is used medicinally. It is sometimes cast into sticks, and in this form, of German manufacture, is of good quality. Chemically pure crystallized potassium cyanide is also in the market.

Potassi Cyanidum, U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
White, opaque, amorphous pieces, or a white, granular powder, deliquescent in damp air. When heated to a low red heat, the salt fuses.	Odorless when perfectly dry, but in moist air exhaling the odor of hydrocyanic acid; taste sharp, somewhat alkaline, but should be ascertained with great care, as the salt is very poisonous; strongly alkaline reaction, emitting odor of hydrocyanic acid.	At 15° C. (59° F.), 2 parts. Boiling, 1 part, with decomposition.	Sparingly soluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>Its aqueous solution yields a white, crystalline precipitate on the addition of an equal volume of sodium bitartrate. With sodium cobaltic nitrite T.S. a copious yellow precipitate is produced.</p> <p>A few drops of the solution give with silver nitrate T.S. a white precipitate, which is soluble in an excess of the solution of potassium cyanide, also in ammonia water, and in concentrated nitric acid (distinction from silver chloride).</p> <p>If 5 C.c. of the solution be shaken with a few drops of ferrous sulphate T.S., and a slight excess of hydrochloric acid then added, a blue precipitate (Prussian blue) will be produced.</p> <p>A solution of 0.65 Gm. of Potassium Cyanide in 12 C.c. of water should require the addition of at least 45 C.c. of decinormal silver nitrate V.S. before the precipitate, which at first redissolves on agitation, becomes permanent (each C.c. of the volumetric solution indicating 2 per cent. of the pure salt).</p>	<p>Limit of Carbonate.</p> <p>Ferrocyanide.</p> <p>Sulphocyanate.</p>	<p>The aqueous solution (1 in 20) should not produce more than a slight effervescence on the addition of diluted hydrochloric acid.</p> <p>After the acid has been added in slight excess, a drop of ferric chloride T.S. should not produce a blue color,</p> <p>Nor a red color.</p>

Uses.—The action of this salt upon animals as a *poison* is the same as that of hydrocyanic acid. The dose is *one-eighth of a grain* (0.008 Gm.). It is more stable than the acid, and is frequently used as a substitute for it.

POTASSII ET SODII TARTRAS. U. S. Potassium and Sodium Tartrate.

[ROCHELLE SALT.]

Preparation.—This salt is made by adding potassium bitartrate to a solution of sodium carbonate: the proportions are shown by the former official process, which is as follows:

Take of Carbonate of Sodium, 12 *troyounces*; Bitartrate of Potassium, in fine powder, 16 *troyounces*; Boiling Water, 5 *pints*. Dissolve the Carbonate of Sodium in the Water, and gradually add the Bitartrate of Potassium. Filter the solution, and evaporate until a pellicle begins to form; then set it aside to crystallize. Pour off the mother-water,

and dry the crystals on bibulous paper. Lastly, evaporate the mother-water, that it may furnish more crystals.

It is advantageous to filter the solution after one-half of its volume has been evaporated and it has cooled and settled, in order to free it from the calcium tartrate which separates, otherwise the crystals will be contaminated.

The following equation shows the reaction :

The chemical constitution of the tartrates will be fully explained under Acidum Tartaricum, but this opportunity will be embraced to note that tartaric acid is a dibasic acid ; in its acid salts the hydrogen can be replaced by a base, which in this case is sodium.

Potassii et Sodii Tartras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, rhombic prisms, or a white powder, slightly efflorescent in dry air. When heated to 74° C. (163.2° F.), the salt fuses to a colorless liquid, which, at a higher temperature, froths, becomes brown, and gradually carbonizes, while inflammable vapors are emitted, having the odor of burning sugar. Finally a black residue is left, consisting of alkaline carbonate mixed with carbon.	Odorless; cooling, saline taste; neutral reaction.	At 15° C. (59° F.), 1.4 parts. Boiling, Less than 1 part.	Almost insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 10-per-cent. aqueous solution of the salt yields a white, crystalline precipitate on the addition of an equal volume of acetic acid. With silver nitrate T.S. it yields a white precipitate, which becomes black on boiling.</p> <p>With sodium cobaltic nitrite T.S. the solution yields a copious yellow precipitate.</p> <p>To a non-luminous flame it communicates a yellow color (<i>sodium</i>), which, when viewed through a blue glass, appears violet-red (<i>potassium</i>).</p> <p>When heated with potassium hydrate T.S., the solution should not give off the odor of ammonia.</p> <p>If 1.41 Gm. of Potassium and Sodium Tartrate be completely decomposed by ignition, the alkaline residue should require for complete neutralization not less than 10 C.c. of normal sulphuric acid (corresponding to 100 per cent. of the pure salt), methyl-orange being used as indicator.</p>	<p>Calcium.</p> <p>Arsenic, Lead, Copper, etc.</p> <p>Sulphate.</p> <p>Limit of Chloride.</p>	<p>The aqueous solution (1 in 20) should not be rendered turbid by the addition of a small amount of ammonium oxalate T.S.,</p> <p>Nor by an equal volume of hydrogen sulphide T.S. either before or after acidulation with diluted hydrochloric acid.</p> <p>If 10 C.c. of the solution (1 in 20) be mixed with 1 C.c. of hydrochloric acid, the addition of 1 C.c. of barium chloride T.S. should produce no turbidity.</p> <p>If 0.36 Gm. of the salt be dissolved in 9 C.c. of water, then 1 C.c. of nitric acid and 0.2 C.c. of decinormal silver nitrate V.S. be added, and the mixture filtered, the filtrate should remain clear upon the further addition of silver nitrate V.S.</p>

Uses.—Rochelle salt, as it is habitually termed, is an efficient purgative in the dose of half an ounce to an ounce (15.5 to 31.1 Gm.). It is an important ingredient in the well-known Seidlitz powders.

POTASSII FERROCYANIDUM. U. S. Potassium Ferrocyanide.

[YELLOW PRUSSIATE OF POTASH.]

Preparation.—When refuse animal substances which contain nitrogen are heated in an iron pot with crude pearlash, impure potassium cyanide is formed. If the fused mass is lixiviated and treated with freshly-precipitated ferrous carbonate, potassium ferrocyanide is produced, according to the following reaction :

This salt is important, because it is the source of all the cyanogen compounds used in medicine.

Potassii Ferrocyanidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Large, soft, transparent, yellow, four-sided monoclinic tables, slightly efflorescent in dry air. When heated to 60° C. (140° F.), the salt becomes white from loss of water, and when 100° C. (212° F.) is reached, it becomes anhydrous.	Odorless; mild, saline taste; neutral reaction.	At 15° C. (59° F.), 4 parts.	Insoluble.
		Boiling, 2 parts.	

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution yields a white, crystalline precipitate on the addition of sodium bitartrate T.S., a dark blue precipitate with ferric chloride T.S., a reddish-brown precipitate with copper sulphate T.S., and a white one with lead acetate T.S., or silver nitrate T.S. Sodium cobaltic nitrite T.S. produces a copious yellow precipitate.	Carbonate.	No effervescence should be caused by the addition of diluted sulphuric acid to a concentrated solution of the salt. The aqueous solution (1 in 20), acidulated with hydrochloric acid, should, upon the addition of barium chloride T.S., remain clear, or, at most, show but a trifling turbidity. If a mixture of 0.5 Gm. of the salt with 1.5 Gm. of pure potassium nitrate and 0.5 Gm. of pure, anhydrous sodium carbonate be heated to redness in a porcelain crucible, the residue dissolved in water, the filtered solution supersaturated with nitric acid, mixed with 0.1 C.c. of decinormal silver nitrate V.S., and again filtered, no turbidity should be produced in the filtrate by the further addition of silver nitrate V.S. The precipitate produced in the aqueous solution, acidulated with nitric acid by silver nitrate T.S., should be of a pure white color, without a tinge of red.
	Limit of Sulphate.	
	Limit of Chloride.	
	Absence of Ferrocyanide.	

Uses.—This salt is rarely employed medicinally: it is *not poisonous* if pure. Chemically, it is important as furnishing a reliable test for ferric salts.

POTASSII HYPOPHOSPHIS. U. S. Potassium Hypophosphite.

Preparation.—When solutions of calcium hypophosphite and potassium carbonate are mixed, potassium hypophosphite and calcium carbonate are produced by double decomposition, thus :

The calcium carbonate is removed by filtration, and the clear solution is evaporated till a pellicle forms, after which it is constantly stirred, with continuance of the heat, until the salt granulates. The heat employed in the evaporation should be kept considerably below 100° C. (212° F.), for fear of explosion. If the salt is required quite pure, it should be dissolved in the granulated state, in official alcohol, and the solution evaporated to a syrupy consistence, and then set aside to crystallize.

Potassii Hypophosphis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
White, opaque, hexagonal plates, or crystalline masses, or a granular powder, very deliquescent. When heated in a dry test-tube, the salt first loses moisture, and then evolves spontaneously inflammable hydrogen phosphide gas, which burns with a bright yellow flame. On triturating or heating the salt with nitrates, chlorates, or other oxidizing agents, it detonates violently.	Odorless; pungent, saline taste; neutral reaction.	At 15° C. (59° F.), 0.6 part. Boiling, 0.3 part.	At 15° C. (59° F.), 7.3 parts. Boiling, 3.6 parts.	Insoluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution (1 in 20) yields a white, crystalline precipitate with sodium bitartrate T.S. With silver nitrate T.S. it yields a white precipitate which rapidly turns brown and black, separating metallic silver. Acidulated with hydrochloric acid and added to excess of mercuric chloride T.S., it first produces a white precipitate of mercurous chloride, and, on further addition, causes the separation of metallic mercury.</p> <p>If 0.1 Gm. of dry potassium hypophosphite be dissolved in 10 C.c. of water, then mixed with 7.5 C.c. of sulphuric acid and 40 C.c. of decinormal potassium permanganate V.S., and the mixture be boiled for fifteen minutes, it should not require more than 2 C.c. of decinormal oxalic acid V.S. to discharge the red color (corresponding to at least 98.7 per cent. of the pure salt).</p>	Carbonate.	<p>The aqueous solution of the salt should not effervesce on the addition of an acid.</p> <p>The aqueous solution of the salt should not be precipitated or rendered cloudy by ammonium oxalate T.S.</p> <p>Separate portions of 5 C.c. of the aqueous solution (1 in 20), heated with 1 C.c. of nitric acid, should remain clear upon the addition of silver nitrate T.S.</p> <p>Or of barium chloride T.S.</p> <p>On mixing the aqueous solution of the salt with a magnesia mixture, not more than a slight cloudiness should make its appearance.</p>
	Calcium.	
	Chloride.	
	Sulphate.	
	Limit of Phosphate.	

Uses.—The only official use made of potassium hypophosphite is to form one of the ingredients of the largely-used syrup of the hypophosphites. It may be given internally in the dose of fifteen grains (0.9 Gm.).

POTASSII IODIDUM. U.S. Potassium Iodide.

KI; 165.56.

Preparation.—An aqueous solution of potassa is treated with iodine in slight excess. The result is the formation of two salts, iodide and iodate of potassium.

By evaporating the solution to dryness the mixed salts are obtained; and if the dry mass be exposed to a red heat, the iodate will be converted into potassium iodide, thus removing this impurity from the iodide.

The mixed salts, towards the close of their evaporation to dryness, should be mixed with powdered charcoal, which facilitates the deoxidation of the iodate. This being accomplished by a dull red heat, the iodide of potassium is dissolved out of the mass, and the solution is set aside to crystallize.

Potassium iodide is always crystallized from an alkaline solution if the manufacturer expects to avoid loss through the discoloration of the product from the separation of free iodine. The official test permits the presence of a small excess of alkali.

Potassii Iodidum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent or translucent, cubical crystals, permanent in dry air, but slightly deliquescent in moist air (the white, opaque, commercial variety being crystallized from an alkaline solution, and less pure), or a whiter granular powder. When heated, the salt decrepitates. At a low red heat it fuses, and at a bright red heat it is slowly volatilized without decomposition.	Peculiar, faint, iodine - like odor; pungent, saline, afterwards bitter taste; neutral or scarcely perceptible alkaline reaction.	At 15° C. (59° F.), 0.75 part. Boiling, 0.5 part.	At 15° C. (59° F.), 18 parts. Boiling, 6 parts.	Soluble in 2.5 parts of glycerin.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.		TESTS FOR IMPURITIES.
<p>The salt yields a white, crystalline precipitate on the addition of sodium bitartrate T.S.</p> <p>If to 5 C.c. of the aqueous solution (1 in 20) of the salt 1 C.c. of chlorine water be added, iodine will be liberated, and impart to the solution a yellow color. On agitating the mixture with a few drops of chloroform, this will acquire a violet color.</p> <p>If 0.5 Gm. of the well-dried salt be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should require not more than 30.25 C.c. nor less than 30 C.c. of decinormal silver nitrate V.S. to produce a permanent red color of silver chromate (corresponding to at least 99.5 per cent. of the pure salt).</p>	Less Soluble Salts.		No residue should be left when 1 Gm. of the salt is dissolved in 2 C.c. of diluted alcohol of specific gravity 0.928.
	Limit of Alkali.		If 1 Gm. of the salt be dissolved in water and 0.05 C.c. (one drop) of decinormal oxalic acid V.S. be added, no color should be produced by the subsequent addition of a drop of phenolphthalein T.S., even after heating.
	Sodium.		When a fragment of the salt is brought into a non-luminous flame on a clean platinum wire, a violet color should appear at once.
	Iodate.		If to a solution of the salt (1 in 20) in distilled water, from which all gases have been expelled by boiling, a little starch T.S. be added, and then a few drops of pure diluted sulphuric acid T.S., no blue color should appear at once.
	Arsenic, Lead, Copper, etc.		The aqueous solution (1 in 20) should not be colored or precipitated by the addition of an equal volume of hydrogen sulphide T.S., either before or after acidulation with hydrochloric acid.
	Sulphate.		The aqueous solution should remain clear after the addition of barium chloride T. S.
	Nitrate or Nitrite.		If 1 Gm. of the salt be mixed with 0.5 Gm. each of iron and of zinc, in coarse powder or filings, and heated in a test-tube with 5 C.c. of sodium hydrate T.S., no ammoniacal vapor should be evolved.
	Iron.		No blue color should be communicated to 5 C.c. of the aqueous solution (1 in 20) by 0.1 C.c. (2 drops) of potassium ferrocyanide T.S.
	Cyanide.		If 5 C.c. of the aqueous solution be gently heated with 1 drop of ferrous sulphate T.S. and 0.5 C.c. of potassium hydrate T.S., no blue color should appear after acidulating the mixture with hydrochloric acid.

Uses.—This is the most valuable medicinal compound of iodine, if the extent to which it is employed is a criterion. It is used as an alternative in five-grain doses (0.3 Gm.); as an antisymphilitic, four drachms (15.5 Gm.), largely diluted, may be given.

POTASSII NITRAS. U.S. Potassium Nitrate.

$\text{KNO}_3 = 100.92.$

[SALTPETRE.]

Preparation.—*Nitre*, or *Saltpetre*, is sometimes a natural product; usually, however, it is produced artificially in what are known as nitre-beds, which are made up of earth and wood-ashes, with animal and vegetable refuse: these are protected from rain by sheds. In time the ammonia, produced by the decomposition of the organic matter in the mixture, is oxidized, nitric acid is formed, which unites with the potassa in the wood-ashes, and potassium nitrate is gradually formed: this is separated by lixiviation, filtration, evaporation, and crystallization. It is generally imported from Europe or India in a crude state and refined in this country.

Potassii Nitræs. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, six-sided, rhombic prisms, or a crystalline powder, permanent in the air. When heated to 353° C. (667.4° F.), the salt melts; at a higher temperature it is decomposed, giving off oxygen at first, and then some of its nitrogen, and leaving a residue of potassium nitrate, nitrite, and oxide. Thrown upon red-hot coals, the salt deflagrates.	Odorless; cooling, saline, and pungent taste; neutral reaction.	At 15° C. (59° F.), 3.8 parts. Boiling, 0.4 part.	Sparingly soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution (1 in 20) yields a white, crystalline precipitate on the addition of sodium bitartrate T.S.; with sodium cobaltic nitrite T.S. a yellow precipitate.	Iron.	{ The aqueous solution (1 in 20) should remain unaffected by the addition of a few drops of potassium ferrocyanide T.S., Or of barium chloride T.S., Or of silver nitrate T.S.,
If a small crystal of ferrous sulphate be dissolved in the aqueous solution (1 in 20), and then concentrated sulphuric acid be poured in so as to form a separate layer, a dark brown color will appear at the line of contact.	Sulphate. Chloride.	
If a drop of diphenylamine T.S. be mixed with the aqueous solution and concentrated sulphuric acid be poured in, as in the preceding test, a deep blue color will appear at the line of contact.	Calcium, Zinc, etc.	{ Or of ammonium carbonate T.S., ammonium oxalate T.S., or ammonium sulphide T.S., Or by the addition of an equal volume of hydrogen sulphide T.S., either before or after acidulation with hydrochloric acid.
	Arsenic, Lead, Copper, etc.	
	Iodine.	{ If to 5 C.c. of the aqueous solution of the salt 1 C.c. of chlorine water and a few drops of starch T.S. be added, no blue color should appear. No yellow color should appear when 1 C.c. of pure concentrated sulphuric acid is added to 0.1 Gm. of the dry salt.
	Chlorate.	

Uses.—Potassium nitrate is diuretic and diaphoretic in doses of ten to twenty grains (0.6 to 1.2 Gm.). In concentrated solution it is antiseptic. It is most largely used in making gunpowder.

POTASSII PERMANGANAS. U.S. Potassium Permanganate.

Preparation.—This salt may be prepared by the British process, which is as follows:

Take of Caustic Potash 5 oz. av.; Black Oxide of Manganese, in fine powder, 4 oz. av.; Chlorate of Potash $3\frac{1}{2}$ oz. av.; Diluted Sulphuric Acid a sufficiency; Distilled Water $2\frac{1}{2}$ pints (Imp. measure). Reduce the Chlorate of Potash to fine powder, and mix it with the Oxide of Manganese; put the mixture into a porcelain basin, and add to it the Caustic Potash, previously dissolved in 4 fl. oz. of the Water. Evaporate to dryness on a sand-bath, stirring diligently to prevent spurting. Pulverize the mass, put it into a covered Hessian or Cornish crucible, and expose it to a dull red heat for an hour, or till it has assumed the condition of a semi-fused mass. Let it cool, pulverize it, and boil with $1\frac{1}{2}$ pints of the Water. Let the insoluble matter subside, decant the fluid, boil again with $\frac{1}{2}$ pint of the Water, again decant, neutralize the united liquors accurately with the Diluted Sulphuric Acid, and evaporate till a pellicle forms. Set aside to cool and crystallize. Drain the crystalline mass, boil it in 6 fl. oz. of the Water and strain through a funnel, the throat of which is lightly obstructed by a little asbestos. Let the fluid cool and crystallize, drain the crystals, and dry them by placing them under a bell-jar over a vessel containing sulphuric acid.

By this process potassium chlorate yields oxygen to manganese dioxide, converting it into manganic acid, which unites with the potassa to form the manganate, potassium chloride being formed at the same time.

When this solution is boiled with water, the potassium manganate is converted into potassium permanganate, according to the following reaction:

The potassium hydrate liberated by the reaction requires neutralization with an acid if all the permanganate is to be obtained, because the latter, in the presence of an excess of potassa, remains in the condition of manganate.

Potassii Permanganas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Slender, monoclinic prisms, of a dark purple color, almost opaque by transmitted and of a blue metallic lustre by reflected light. Permanent in the air. When heated, the salt decrepitates, and at 240° C. (464° F.) it decomposes, yielding oxygen, potassium manganate, and manganese dioxide.	Odorless; sweet, afterwards disagreeable, astringent taste; neutral reaction.	At 15° C. (59° F.), 16 parts.	Cold, Decomposed.
		Boiling, 3 parts.	Boiling, Decomposed.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution of the salt is of a deep violet-red color when concentrated, and of a rose color when much diluted, and this color is discharged by hydrogen sulphide, ferrous sulphate, oxalic acid, alcohol, and many other readily oxidizable substances, especially if the solution be first rendered acid by sulphuric acid.</p> <p>If 0.1 Gm. of the salt be dissolved in 10 C.c. of boiling distilled water, and 1 C.c. of sulphuric acid be cautiously added, the solution should require for complete decoloration not less than 31.3 C.c. of decinormal oxalic acid V.S. (corresponding to at least 98.7 per cent. of the pure salt).</p>	<p>Limit of Sulphate.</p> <p>Chloride.</p> <p>Nitrate or Chlorate.</p>	<p>If 0.5 Gm. of the salt be boiled with 10 C.c. of ammonia water and 10 C.c. of water (or with 20 C.c. of water and 4 C.c. of alcohol) until it is completely decomposed, and the liquid then filtered, the clear, colorless filtrate will serve for the following tests:</p> <p>If to 5 C.c. of the filtrate, acidulated with nitric acid, barium chloride T.S. be added, not more than very slight turbidity should be produced.</p> <p>If to another portion of 5 C.c., acidulated with nitric acid, silver nitrate T.S. be added, it should produce no precipitate or cloudiness.</p> <p>If to another portion of 5 C.c. of the filtrate 1 drop of diphenylamine T.S. be added, and then 1 C.c. of pure concentrated sulphuric acid be poured in, so as to form a layer beneath, no blue color should appear at the line of contact.</p>

Uses.—Potassium permanganate is one of the most powerful oxidizing agents known, and it is for this reason that the cautionary note is properly appended, "It should not be triturated nor combined in solution with organic or readily oxidizable substances." It is owing to the facility with which it parts with oxygen, when in contact with organic matter, that it is useful as a disinfectant: hence when used externally its application by means of lint, towels, etc., should be avoided, because its energy would be spent upon these instead of upon the part of the body intended to be affected by it. Chemically, it is used as a volumetric test and oxidizer, for which it is admirably adapted on account of the distinctness of its color reactions, although the difficulty of keeping the solution from partial decomposition through the action of light and air is a serious annoyance and interferes with the accuracy of the estimation.

POTASSII SULPHAS. U.S. Potassium Sulphate.

Preparation.—Potassium sulphate is obtained as a by-product in many chemical processes, although since the introduction of sodium nitrate as the source of the nitrates it is not produced very largely. It is also obtained from *kainite*, the mineral found in the Stassfurt salt-beds, which is a double potassium and magnesium sulphate. If it should be necessary to make it directly at any time, it can be made by decomposing potassium nitrate with sulphuric acid.

Potassii Sulphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, hard, transparent, six-sided, rhombic prisms terminated by pyramids, or a white powder, permanent in the air. When heated, the crystals decrepitate; at a bright red heat they fuse, and at a white heat the salt suffers partial decomposition.	Odorless; slightly bitter, saline taste; neutral reaction.	At 15° C. (59° F.), 9.5 parts. Boiling, 4 parts.	Insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution of the salt yields a copious yellow precipitate with sodium cobaltic nitrite T.S., and a white, crystalline precipitate with excess of tartaric acid T.S.	Sodium.	When held in a non-luminous flame on a clean platinum wire, the salt should at once impart to the flame a violet color.
	Arsenic, Lead, Copper, etc.	The aqueous solution (1 in 20) should remain unaffected by the addition of an equal volume of hydrogen sulphide T.S., either before or after acidulation with hydrochloric acid,
	Zinc, Iron, Aluminium, etc.	Or by the addition of a small amount of ammonium sulphide T.S.
	Calcium.	Other portions of the aqueous solution should not be rendered turbid by the addition of ammonium oxalate T.S.,
	Magnesium.	Or of sodium phosphate T.S. and ammonia water,
	Chloride.	Or of silver nitrate T.S.
	Iron.	The addition of potassium ferrocyanide T.S. should not produce a blue color,
	Copper.	Or a red color.

Uses.—The principal use for potassium sulphate in pharmacy has been to act as a diluent in powdering ipecac and opium in the so-called Dover's powder. It is well adapted for this purpose, for, on account of the hardness of the crystals, the ingredients are thoroughly blended during the time required to produce a fine powder. Sugar of milk is employed now as a substitute for it, although many still continue to use potassium sulphate.

QUESTIONS ON CHAPTERS XXXVII. AND XXXVIII.

THE ALKALIES AND THEIR COMPOUNDS AND THE POTASSIUM SALTS.

- What are alkalis, and what are their properties?
- What are the alkali-metals, and their properties?
- How many chlorides are obtained from the alkali-metals?
- Are their oxides acid or basic?
- Are the alkaline hydrates decomposable by heat?
- What is the process for obtaining the alkali-metals?
- What is ammonium, and why is it classed with the metals?
- What was formerly the source of the potassium salts?
- What is the present source, and how are they obtained?

- How may potassium in its combinations be recognized?
 Potassa—Give formula in symbols and molecular weight.
 What is caustic potash, and how is it made?
 What is meant by "potassa by alcohol"?
 What is meant by "potassa by barytes"?
 What are the physical properties of potassa?
 How may the following impurities be detected?—viz.: Organic matter; chloride; sulphate; carbonate; silica
 For what is potassa used?
 How much water does commercial caustic potassa usually contain?
 What is potassa with lime, and how is it prepared?
 What is its medicinal use?
 What is solution of potassa, and how is it made?
 What is its Latin official name?
 How much potassium hydrate does it contain?
 By what other process may it be made?
 How strong should the potassa be? and if the potassa is not of the proper strength, how may it be used?
 Explain the chemical reaction which takes place between the lime and the potassium bicarbonate in making this solution.
 Why is potassium bicarbonate used in preference to the carbonates (which are cheaper) in preparing this solution?
 Is the proportion of water used in making the solution of the bicarbonate a matter of indifference? How much should be used?
 Should more than the theoretical quantity of lime be used? Why?
 How is this solution injured by exposure to air?
 What are the advantages of the alternative formula?
 How may this solution be distinguished from solution of soda?
 How may the following impurities be detected?—viz.: Carbonate; alkaline earths; sulphate; chloride; foreign impurities.
 What is its medicinal use? Give the dose.
 If a large quantity should be swallowed, what would be the proper antidotes?
 What is sulphurated potassa, and how is it made?
 Is this a definite chemical compound?
 Explain the chemical reaction which probably takes place between the carbonate and the sulphur.
 What is the common or popular name of this preparation?
 Does it deteriorate by keeping? What change takes place?
 How may it be identified as a potassium salt?
 What percentage of potassium sulphide should be present?
 How may it be shown whether it contains this amount?
 Explain the reaction which takes place when cupric sulphate and potassium sulphate are mixed in the presence of water.
 What is its medicinal use? Give its dose.
 Potassii acetat—Give formula in symbols and molecular weight.
 How may this salt be made?
 Explain the chemical reaction which takes place between potassium bicarbonate and acetic acid.
 What are its solubilities?
 How may it be identified?
 What are the tests for the following impurities?—viz.: Chloride; sulphate; silica; metals; alkaline earths; carbonate; organic impurities.
 What are its uses in medicine? Give its dose.
 Potassii bicarbonas—Give formula in symbols and molecular weight.
 How is it made?
 What is saleratus, and how is it prepared?
 What are the physical properties of potassium bicarbonate?
 What are its solubilities?
 How much of its weight does it lose at a red heat?
 How may it be identified?
 How may the following impurities be detected?—viz.: Sulphate; chloride; carbonate.
 What are the uses of this salt, and what is the dose?
 Potassium bichromate—Give formula in symbols and molecular weight.
 What is the source of this salt, and where is it found?

How is the salt prepared?

Explain the chemical reactions which take place.

What is supposed to be the chemical composition of this salt?

What are its physical properties?

What are its solubilities?

How may it be identified?

How may the presence of a sulphate be detected?

For what is this salt used?

What is its proper dose? What is the effect of large doses?

In case of poisoning by it, what would be proper antidotes?

Cream of tartar—Give formula in symbols and molecular weight.

How is it made?

What are argols?

Give the physical properties of cream of tartar.

What are its solubilities?

How may it be identified?

How may the following impurities be detected?—viz.: Sulphate; chloride; metals; more than 6 per cent. of calcium tartrate.

What chemical substance besides potassium bitartrate is always present in grape juice?

How much of this impurity is permitted by the official test?

For what purposes in pharmacy is it used?

What are its medicinal uses? Give the dose.

Potassium bromide—Give formula in symbols and molecular weight.

What process was formerly official for making this salt?

Explain the chemical reaction which takes place.

In what other way may it be made?

Explain the reaction which takes place.

Where does this salt come from?

Describe its physical properties and solubilities.

How may it be identified?

How may the following impurities be detected?—viz.: Bromate; iodide; sulphate; more than 3 per cent. of chloride; more than 0.1 per cent. of alkali.

Upon what does the official test to indicate the presence of more than 3 per cent. of chloride depend?

What is its medicinal use? Give the dose.

Potassium carbonate—Give formula in symbols and molecular weight.

What is the commercial name of this salt?

How is it made?

How may a purer carbonate be produced?

What reaction takes place when potassium bicarbonate is heated to redness?

Describe the physical properties of potassium carbonate.

What are its solubilities?

How much pure anhydrous potassium carbonate should it contain?

How may this be tested?

How may the following impurities be detected?—viz.: Silica; alkaline earths; chloride; sulphate.

What is its medicinal use, and what is the dose?

What are its effects in an overdose?

What are the proper antidotes to administer?

Potassium chlorate—Give formula in symbols and molecular weight.

How was this formerly made?

What is the objection to this process?

How is it now prepared?

Explain the reactions which take place in its preparation.

Describe its physical properties and solubilities.

How may it be identified?

How may the following impurities be detected?—viz.: Sulphate; calcium; chloride.

What follows when potassium chlorate is triturated with readily oxidizable or combustible substances?

For what is potassium chlorate used chemically?

What is its medicinal use? Give the dose.

Potassium citrate—Give formula in symbols and molecular weight.

How is this salt made?

When made from carbonate instead of potassium bicarbonate, what impurity is apt to be present?

What are its physical properties and solubilities?

How may it be identified?

How may the following impurities be detected?—viz.: Carbonate; sulphate; chloride; tartrate.

What are its medicinal uses? Give the dose.

Into what official preparation does it enter?

Give the Latin name, formula, and mode of preparation of efflorescent potassium citrate.

Potassium cyanide—Give formula in symbols and molecular weight.

What is the process for making this salt, which was formerly official?

Explain the reaction which takes place between potassium ferrocyanide and potassium carbonate.

In what form does it occur in commerce?

Describe the physical properties of the official salt.

What are its solubilities?

How may it be identified?

What per cent. of pure potassium cyanide should it contain, and how may this be tested?

How may the impurity of carbonate be detected?

What is the medicinal use of it, and what is the dose?

What advantage has it over hydrocyanic acid?

Rochelle salt—Give formula in symbols and molecular weight.

How is this salt made?

Explain the reaction which takes place.

What is meant by saying that tartaric acid is a dibasic acid?

Describe its physical properties and solubilities.

How may its identity and purity be tested?

What are the tests for the following impurities?—viz.: Calcium; sulphate; chloride; ammonium salts.

What is its medicinal use, and what is the dose?

Potassium ferrocyanide—Give formula in symbols and molecular weight.

How is this salt made?

What reaction takes place when potassium cyanide is mixed with ferrous carbonate in the presence of water?

What renders this salt important?

Describe its physical properties and solubilities.

What are the tests for the following impurities?—viz.: Carbonate; sulphate; chloride.

Is this salt poisonous?

Of what importance is it chemically?

Potassium hypophosphite—Give formula in symbols and molecular weight.

How may this salt be prepared?

Explain the reaction which takes place.

Should the evaporation of the solution be conducted at a high heat or a low one?

Why?

How may the salt be rendered pure?

Describe its physical properties and solubilities.

How may it be identified?

What are the tests for the following impurities?—viz.: Carbonate; calcium; sulphate; phosphate.

Into what official preparation does it enter?

What is the dose of it?

Potassium iodide—Give formula in symbols and molecular weight.

How is it prepared, and what reaction takes place?

Should it be crystallized from an acid or an alkaline solution? Why?

The presence of how much alkali is permitted by the official test?

How may it be identified?

What are the tests for the following impurities?—viz.: Iodate; more than about 0.5 per cent. of chloride or bromide; sulphate.

What are its uses, and what is the dose?

Potassium nitrate—Give formula in symbols and molecular weight.

Where does it come from?

How is it made?

Describe its physical properties and solubilities.

How may it be identified?

What are the tests for the following impurities?—viz. : Metals; alkaline earths; sulphate; chloride.

What are its uses? What is the dose?

Potassium permanganate—Give formula in symbols and molecular weight.

What is the British process for making this salt?

Explain the reactions which take place in its formation.

Describe its physical properties and solubilities.

How may its identity and purity be tested?

How may the following impurities be detected?—viz. : Nitrate; chloride; sulphate.

Why is the cautionary official note appended, as follows?—viz. : "It should not be brought in contact with organic or readily oxidizable substances."

What renders it useful as a disinfectant, and what special care should be used in its application?

How and why is it used chemically?

Potassium sulphate—Give formula in symbols and molecular weight.

How is this salt obtained?

Describe its physical properties and solubilities.

How may its identity and purity be tested?

What are the tests for the following impurities?—viz. : Alkaline earths; metals; chloride.

For what was it formerly used in pharmacy?

What is now used as a substitute for it?

Solution of potassium citrate—What is its official Latin name?

How is it made?

How much potassium citrate does it contain?

What is the dose?

CHAPTER XXXIX.

THE SODIUM SALTS.

THE sodium salts are generally more frequently used than those having potassium for their base, because they are relatively cheaper, and are often more soluble. The metal *Sodium* is a soft, malleable, ductile solid, which must be protected from the oxygen of the air by being constantly immersed in petroleum or naphtha.

Tests for Sodium Salts.

Sodium may be recognized in its salts by the following reactions :

1. The intensely yellow color produced when even a trace of a sodium compound is introduced into a colorless flame.
2. A reliable and practical precipitant is yet to be discovered for the sodium salts, because the compounds are generally very soluble. Neutral solutions may be precipitated by potassium metantimoniate: this reaction, however, has but a limited application.
3. Sodium salts are generally colorless, and not volatile below a red heat.

Official Sodium Salts and Preparations.

Official Name.	Preparation.
With Inorganic Radicals.	
Soda	By boiling solution of sodium carbonate with calcium hydrate and evaporating.
Sodii Arsenas	By heating together arsenous acid, sodium nitrate, and sodium carbonate.
Sodii Bicarbonas	By exposing sodium carbonate to the action of carbon dioxide.
Sodii Bisulphis	By saturating a solution of sodium carbonate with sulphurous acid.
Sodii Boras	By purifying the native salt.
Sodii Bromidum	By treating ferrous bromide with sodium carbonate.
Sodii Carbonas	By heating sodium sulphate with chalk and coal.
Sodii Carbonas Exsiccatus	By heating the carbonate.
Sodii Chloras	By double decomposition between sodium bitartrate and potassium chlorate.
Sodii Chloridum	By evaporating sea-water.
Sodii Hypophosphis	By double decomposition between calcium hypophosphite and sodium carbonate.
Sodii Hyposulphis	By decomposing calcium thiosulphate with sodium sulphate.
Sodii Iodidum	By treating ferrous iodide with sodium carbonate.
Sodii Nitras	By purifying the native salt.
Sodii Nitris	By decomposing sodium nitrate by heating in contact with starch, lead, or other reducing substances.

Official Sodium Salts and Preparations.—Continued.

Official Name.	Preparation.
With Inorganic Radicals.	
Sodii Phosphas	By treating acid calcium phosphate with sodium carbonate.
Sodii Pyrophosphas	By heating sodium phosphate to redness, dissolving and crystallizing.
Sodii Sulphas	By treating common salt with sulphuric acid.
Sodii Sulphis	By decomposing sodium carbonate with sulphurous acid.
Liquor Sodæ	By dissolving sodium hydrate in water.
Liquor Sodæ Chloratæ	Double decomposition between chlorinated lime and sodium carbonate.
Liquor Sodii Arsenatis	1 per cent. solution of exsiccated sodium arsenate.
Liquor Sodii Silicatis	Solution of sodium silicate.
Trochisci Sodii Bicarbonatis	Each contains three grains of sodium bicarbonate.
With Organic Radicals.	
Sodii Acetas	By decomposing sodium carbonate with acetic acid.
Sodii Benzoas	By decomposing sodium carbonate with benzoic acid.
Sodii Salicylas	By decomposing sodium carbonate with salicylic acid.
Sodii Sulphocarbolas	By double decomposition between barium sulphocarbonate and sodium carbonate.
Mistura Rhei et Sodæ	Contains sodium bicarbonate.

Unofficial Preparations of Sodium.

Sodii Carbolas, $\text{NaC}_6\text{H}_5\text{O}$. Sodium Carbolate.	Add metallic sodium to carbolic acid, and allow it to crystallize.
Sodii Citras, $2\text{C}_6\text{H}_5\text{NaO}_7 \cdot 11\text{H}_2\text{O}$. Sodium Citrate.	Saturate a solution of citric acid with sodium bicarbonate, evaporate, and allow it to crystallize.
Sodii-Citro-Tartras Effervescens. Effervescent Sodium Citro-tartrate.	17 p. sodium bicarbonate; 8 p. tartaric acid; 6 p. citric acid. Mix, and place in a dish heated to about 200°F . Stir constantly until a granular salt is obtained. Lastly, sift it.
Sodii et Ammonii Phosphas, $\text{NH}_4\text{NaHPO}_4 \cdot 4\text{H}_2\text{O}$. Sodium and Ammonium Phosphate.	Dissolve 5 p. crystallized sodium phosphate and 2 p. ammonium phosphate in 20 p. hot water; then add ammonia water until the liquid is alkaline, and crystallize.
Sodii et Argenti Hyposulphis, $2\text{Na}_2\text{S}_2\text{O}_3 + \text{Ag}_2\text{S}_2\text{O}_3$. Sodium and Silver Hyposulphite.	Dissolve freshly precipitated silver oxide in a solution of sodium hyposulphite, and evaporate to crystallize.
Sodii Ethylas, $\text{C}_2\text{H}_5\text{NaO}$. Sodium Ethylate.	Caustic. Used in alcoholic solution; also applied externally mixed with olive oil.
Sodii Nitro-Prussidum, $\text{Na}_3\text{Fe}(\text{CN})_6\text{NO} \cdot 2\text{H}_2\text{O}$. Sodium Nitro-Prusside.	Digest 1 p. potassium ferrocyanide with 2 p. nitric acid and 2 p. water until it ceases to produce a blue precipitate with iron salts. When cool, neutralize the mother-liquid with sodium carbonate, then collect the red crystals.
Sodii et Platini Chloridum, $2\text{NaCl} \cdot \text{PtCl}_4 \cdot 6\text{H}_2\text{O}$. Sodium and Platinum Chloride.	Dissolve 3 p. platinic chloride and 5 p. sodium chloride in water, and evaporate to dryness, stirring continually.
Sodii Silicas, Na_2SiO_3 . Sodium Silicate.	Mix 1 p. silica and 2 p. dried sodium carbonate; fuse in an earthen-ware crucible, and pour the mass on a slab. Dissolve in water, filter, and concentrate to crystallize.
Sodium Silico-Fluoride, Na_2SiF_6 .	Antiseptic. A mild caustic.
Sodii Stannas, Na_2SnO_3 . Sodium Stannate.	Fuse tin-ore with soda and sodium nitrate.
Sodii Sulphobenzozas, $\text{C}_6\text{H}_4(\text{NaSO}_3)\text{COONa}$. Sodium Sulphobenzozoate.	Non-poisonous antiseptic.
Sodii Ethylsulphas, $\text{C}_2\text{H}_5\text{NaSO}_4 \cdot \text{H}_2\text{O}$. Sodium Sulphovinate, Sodium Ethylsulphate.	Cathartic. The dose for children is from 2 to 3 drachms.
Sodii Tartras, $\text{Na}_2\text{C}_4\text{H}_4\text{O}_6 \cdot 2\text{H}_2\text{O}$. Sodium Tartrate.	Dissolve 6 p. tartaric acid and $7\frac{1}{2}$ p. sodium bicarbonate, each separately, in water. Mix the solutions, filter, and concentrate to crystallize.
Sodii Valerianas, $\text{NaC}_5\text{H}_9\text{O}_2$. Sodium Valerianate.	Saturate valerianic acid with sodium carbonate.

SODA. U.S. Soda.

NaOH; 89.96.

[SODIUM HYDRATE. SODIUM HYDROXIDE. CAUSTIC SODA.]

Preparation.—Owing to the improvements in the manufacture of metallic sodium and the cheapening of the product, soda can be found in commerce which has been made by oxidizing the metal by bringing it in contact with water and evaporating the pure solution of soda. When the pure hydrate is not needed, the white caustic soda, in sticks, made by evaporating a solution of soda (see Liquor Sodæ) and casting the fused residue into moulds, is used. (See Potassa, page 524.)

Soda. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Dry, white, translucent pencils, or fused masses, showing a crystalline fracture. Great caution is necessary in tasting and handling it, as it rapidly destroys organic tissues. Exposed to the air, it rapidly deliquesces, absorbs carbon dioxide, and becomes covered with a dry coating of carbonate.	Odorless; acid and caustic taste; strongly alkaline reaction.	At 15° C. (59° F.), 1.7 parts. Boiling, 0.8 part.	Very soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated to about 525° C. (977° F.), Soda melts to a clear, oily liquid, and at a bright red heat it is slowly volatilized unchanged. When introduced into a non-luminous flame, it imparts to it an intensely yellow color.	Organic Matter.	The aqueous solution of Soda should be colorless.
To neutralize 0.4 Gm. of Soda should require not less than 9 C.c. of normal sulphuric acid (each C.c. corresponding to 10 per cent. of pure sodium hydrate), phenolphthalein being used as indicator.	Potassium.	After being acidulated with acetic acid separate portions of it should yield no precipitate on the addition of platinic chloride T.S., or sodium cobaltic nitrite T.S., or excess of tartaric acid T.S.
	Arsenic, Copper, Lead, etc.	If 1 Gm. of Soda be dissolved in 10 C.c. of water and the solution slightly supersaturated with acetic acid, 10 C.c. of the solution should not be colored or rendered turbid by the addition of an equal volume of hydrogen sulphide T.S.,
	Iron, Aluminum, etc.	Nor by the subsequent addition of ammonia water in slight excess.
	Calcium.	The remainder of the acidulated solution should not be rendered turbid by ammonium oxalate T.S.
	Chloride.	If a solution of 1.2 Gm. of Soda in 10 C.c. of water be slightly supersaturated with nitric acid, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of silver nitrate V.S.
	Sulphate.	If to a solution of 2.5 Gm. of Soda in 10 C.c. of water, strongly supersaturated with hydrochloric acid, 0.1 C.c. of barium chloride T.S. be added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.
	Silicate, etc.	If 0.7 Gm. of Soda be dissolved in 1.5 C.c. of water, and the solution added to 10 C.c. of alcohol, not more than a slight, white precipitate should occur within 10 minutes.
	Carbonate.	After boiling this alcoholic solution with 5 C.c. of calcium hydrate T.S. and filtering, not the slightest effervescence should take place on adding the filtrate to an excess of diluted hydrochloric acid.
	Nitrate.	If 0.2 Gm. of Soda be dissolved in 2 C.c. of water, and carefully mixed with 5 C.c. of pure sulphuric acid and 3 drops of indigo T.S., the blue color should not be entirely discharged.

Uses.—*Caustic Soda*, as it is termed commercially, is sometimes preferred to the analogous potassium salt, in the belief that it is milder and less deliquescent. It is used pharmaceutically in making solution of soda by the *alternative* process.

LIQUOR SODÆ. U. S. Solution of Soda.

[SOLUTION OF SODIUM HYDRATE.]

An aqueous solution of Sodium Hydrate [$\text{NaOH} = 39.96$], containing about 5 per cent. of the hydrate.

	Metric.	Old form.
Sodium Carbonate	170 Gm.	6 oz. av.
Lime	50 Gm.	1 oz. av. 384 grains.
Distilled Water, a sufficient quantity.		

Dissolve the Sodium Carbonate in 400 C.c. [old form 13 fl. oz.] of boiling Distilled Water. Slake the Lime with about 30 C.c. [old form 1 fl. oz.] of Distilled Water, then mix it well with 400 C.c. [old form 13 fl. oz.] of Distilled Water, pour the mixture into a tared flask, and, having heated it to boiling, gradually add to it the solution of Sodium Carbonate, and boil during ten minutes. Then add enough Distilled Water to the flask to make the contents weigh 1000 Gm. [old form 2 pints], and set the flask aside, well stoppered, until the contents are cold. Lastly, strain the liquid through linen, set it aside in a well-stoppered bottle until it has become clear by subsidence, and separate the clear solution by decantation, or by means of a siphon.

Solution of Soda may also be prepared in the following manner:

	Metric.	Old form.
Soda	56 Gm.	1 oz. av.
Distilled Water	944 Gm.	1 pint.
To make	1000 Gm.	about 1 pint.

Dissolve the Soda in the Distilled Water.

The Soda used in this process should be of the full strength directed by the Pharmacopœia (90 per cent.). Soda of any other strength, however, may be used, if a proportionately larger or smaller quantity be taken; the proper amount for the above formula being ascertained by dividing 5000 by the percentage of absolute Soda (sodium hydrate) contained therein.

Solution of soda should be kept in bottles made of green glass, and provided with glass stoppers coated with paraffin or petrolatum.

The sodium hydrate is obtained in this process by decomposing the carbonate by heating it in contact with an aqueous mixture of calcium hydrate: calcium carbonate is formed, and sodium hydrate remains in solution.

Liquor Soda. U. S.	ODOR, TASTE, AND REACTION.
A clear, colorless liquid. When dropped into a concentrated solution of tartaric acid, no precipitate is produced (difference from solution of potassa). Sp. gr. about 1.059 at 15° C. (59° F.).	Odorless; very acrid and caustic taste; strongly alkaline reaction.

QUANTITATIVE TEST.

To neutralize 20 Gm. of Solution of Soda should require 25 C.c. of normal sulphuric acid V.S. (each C.c. of the volumetric solution indicating 0.2 per cent. of absolute sodium hydrate), phenolphthalein being used as indicator.

It should conform to the same reactions and tests as an aqueous solution of Soda. (See Soda.)

Uses.—Solution of soda is an antacid, and is used for the same purposes and in the same dose as solution of potassa (see p. 527).

SODII ACETAS. *U.S.* Sodium Acetate.

Preparation.—This salt is obtained on the large scale in the process for making acetic acid. For medicinal purposes it may be made conveniently by saturating acetic acid with sodium carbonate, filtering the solution, concentrating it, and obtaining the salt in crystals.

It is sometimes granulated, and in this form it is more convenient for dispensing purposes than the usual large crystals.

Sodii Acetas. <i>U.S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, or a granular, crystalline powder, efflorescent in warm, dry air. When heated to 60° C. (140° F.), the salt begins to liquefy. At 123° C. (253.4° F.), it becomes dry and anhydrous; at 315° C. (599° F.), it is decomposed with evolution of inflammable, empyreumatic vapors, leaving a black residue of sodium carbonate and carbon, which imparts to a non-luminous flame an intensely yellow color, gives an alkaline reaction with litmus paper, and effervesces with acids.	Odorless; cooling, saline taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 1.4 parts. Boiling, 0.5 part.	At 15° C. (59° F.), 30 parts. Boiling, 2 parts.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

IMPURITIES.

TESTS FOR IMPURITIES.

The aqueous solution (1 in 20) of the salt colors litmus paper or T.S. blue, but does not redden phenolphthalein T.S. unless carbonate be present.

If 5 C.c. of the aqueous solution be heated with 1 C.c. of sulphuric acid and 0.5 C.c. of alcohol, acetic ether will be formed, recognizable by its odor.

Potassium.

Arsenic, Lead,
Zinc, etc.

Iron, etc.

If a non-luminous flame be colored by the introduction of the salt, and viewed through a blue glass, the yellow color should entirely disappear, no red color taking its place.

If to 5 C.c. of the aqueous solution (1 in 20), slightly acidulated with acetic acid, an equal volume of hydrogen sulphide T.S. be added, no color or turbidity should appear either at once

Or after adding ammonia water in slight excess.

TESTS.—(Continued.)

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
On the addition of a few drops of ferric chloride T.S., the solution assumes a deep red color, and, when boiled, yields a brown precipitate.	Calcium.	The aqueous solution, acidulated with acetic acid, should not be rendered turbid by ammonium oxalate T.S.
If 1.36 Gm. of Sodium Acetate be completely decomposed at a red heat, and the residue dissolved in water, it should require for complete neutralization 10 C.c. of normal sulphuric acid (corresponding to 100 per cent. of the pure salt), methyl-orange being used as indicator.	Limit of Chloride.	If a solution of 1 Gm. of the salt in 50 C.c. of water be slightly acidulated with nitric acid, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of silver nitrate V.S.
	Limit of Sulphate.	If to a solution of 2 Gm. of the salt in 10 C.c. of water, acidulated with hydrochloric acid, 0.1 C.c. of barium chloride T.S. be added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.

Uses.—Sodium acetate is often preferred to potassium acetate as a diuretic. It is not deliquescent like the latter, and is said to be as efficient, although milder in its action. The dose is from twenty to sixty grains (1.3 to 3.8 Gm.).

SODII ARSENAS. U.S. Sodium Arsenate.

[SODII ARSENIAS, PHARM. 1880.]

Preparation.—A process for this salt was formerly official: it is as follows:

Take of Arsenious Acid, in fine powder, 960 *grains*; Nitrate of Sodium, in fine powder, 816 *grains*; Dried Carbonate of Sodium, in fine powder, 528 *grains*; Distilled Water, boiling hot, *half a pint*. Having mixed the powders thoroughly, put the mixture into a large clay crucible, and cover it with the lid. Expose it to a full red heat until effervescence has ceased and complete fusion has taken place. Pour the fused salt on a porcelain slab, and, as soon as it has solidified, and while it is still warm, put it into the hot water, and stir until it is dissolved. Filter the solution, and set it aside to crystallize. Drain the crystals, and, having dried them rapidly on filtering paper, keep them in a well-stopped bottle.

The rationale of this process is that when arsenous acid, sodium nitrate, and sodium carbonate are fused together, sodium pyroarsenate is formed, whilst nitrous anhydride and carbon dioxide escape as gases.

Sodium pyroarsenate is converted into the orthoarsenate (the official salt) by dissolving the former in water, filtering the solution, and crystallizing.

Sodii Arsenas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, efflorescent in dry air, and somewhat deliquescent in moist air. When gently heated, the salt loses 5 molecules of water (28.8 per cent.), and is converted into a white powder. At 148° C. (298.4° F.) the rest of the water of crystallization is lost, the salt fuses, and at a red heat is converted into pyroarsenate. It imparts an intensely yellow color to a non-luminous flame.	Odorless; mild, alkaline taste (the salt is very poisonous); faintly alkaline reaction.	At 15° C. (59° F.), 4 parts. Boiling, Very soluble.	At 15° C. (59° F.), Very slightly soluble. Boiling, 60 parts.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
The aqueous solution (1 in 20) of the salt yields a white precipitate with barium chloride T.S., or with calcium chloride T.S., and a dark red precipitate with silver nitrate T.S., all of which precipitates are soluble in nitric acid. If 0.5 C.c. of the aqueous solution (1 in 20) be mixed with 2 C.c. of hydrochloric acid, a drop of this mixture be placed upon a bright piece of copper-foil, and a gentle heat applied, a dark steel-gray film will be deposited from the drop upon the copper.	Arsenite. Lead, Copper, Iron, etc.	If to 2 C.c. of the aqueous solution (1 in 20) 5 C.c. of decinormal silver nitrate V.S. be added, and the precipitate redissolved by excess of ammonia water, no black precipitate of reduced silver should appear on boiling. If to 5 C.c. of the aqueous solution 1 C.c. of ammonium sulphide T.S. be added, no turbidity or coloration should appear.	

Uses.—The only advantage in using this salt in preference to arsenous acid is that the practitioner is more apt to get it of uniform quality: their properties are identical. The dose is from one-twelfth to one-third of a grain (0.005 to 0.02 Gm.).

SODII BENZOAS. U. S. Sodium Benzoate.

Preparation.—Benzoic acid is added to a hot concentrated solution of pure sodium carbonate until effervescence ceases. The solution is evaporated, cooled, and allowed to crystallize, or, preferably, evaporated to dryness and granulated.

The yield of granulated salt is about one and one-third times the quantity of benzoic acid used.

Sodii Benzoas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, amorphous powder, efflorescent on exposure to air. When heated, the salt melts, emits vapors having the odor of benzoic acid, then chars, and finally leaves a residue of sodium carbonate and carbon. To a non-luminous flame it imparts an intensely yellow color.	Odorless, or having a faint odor of benzoïn; sweetish, astringent taste; neutral reaction.	At 15° C. (59° F.), 1.8 parts. Boiling, 1.3 parts.	At 15° C. (59° F.), 45 parts. Boiling, 20 parts.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If a few drops of ferric chloride T.S. be added to an aqueous solution of the salt, a flesh-colored precipitate will be deposited.</p> <p>If 5 C.c. of diluted nitric acid be added to a solution of 1 Gm. of the salt in 10 C.c. of water, a white precipitate of benzoic acid will be produced, which, after being thoroughly washed, should conform to the tests of purity given under Acidum Benzoicum.</p> <p>If 2 Gm. of Sodium Benzoate be ignited in a porcelain capsule until most of the carbonaceous matter is destroyed, and the residue be then dissolved in 20 C.c. of water, it should require for complete neutralization not less than 13.9 C.c. of normal sulphuric acid (corresponding to at least 99.8 per cent. of the pure salt), methyl-orange being used as indicator.</p>	<p>Chloride.</p> <p>Sulphate.</p> <p>Potassium.</p> <p>Lead, Iron, etc.</p>	<p>The filtrate from the precipitated benzoic acid should not be rendered turbid by silver nitrate T.S.,</p> <p>Nor by barium chloride T.S.</p> <p>Five C.c. of the aqueous solution (1 in 20) should not give a precipitate with 0.5 C.c. of sodium cobaltic nitrite T.S.</p> <p>If to 5 C.c. of the aqueous solution (1 in 20) an equal volume of hydrogen sulphide T.S. be added, no coloration or turbidity should be perceptible either before or after the addition of 1 C.c. of ammonia water.</p>

Uses.—Sodium benzoate has been prescribed as a remedy in phthisis, diphtheria, and similar complaints, in sixty-grain doses (3.8 Gm.). It is employed also in rheumatism.

SODII BICARBONAS. U.S. Sodium Bicarbonate.

All the processes for making this important salt of sodium, with one exception, consist in the addition of carbon dioxide to sodium carbonate. This operation cannot be carried on profitably upon the small scale: hence it is most advantageous for the pharmacist to buy commercial sodium bicarbonate and purify it for dispensing purposes (see page 560). Sodium carbonate contains ten molecules of water of crystallization; sodium bicarbonate contains none: hence provision must be made for the escape of this water, which is thrown out of combination during the process of carbonating. The crystallized sodium carbonate is placed upon false bottoms in chambers arranged so that the water can escape as it is liberated.

Sodium bicarbonate is also prepared by the ammonia-soda process, or *Solvay's*, as it is usually called. In this, carbon dioxide is passed into a solution of common salt in ammonia water, double decomposition ensues, sodium bicarbonate is precipitated, and ammonium chloride, being very soluble, remains in solution.

In the U. S. P. 1880 two sodium bicarbonates were official, "commercial" and "purified:" the former has been dropped, and Sodii

Bicarbonas is alone admitted to the U.S.P. 1890. This is not the ordinary "Bicarbonate of Soda:" the official requirement being that it shall contain 98.6 per cent. of sodium bicarbonate. In order to attain this high grade, it is necessary to purify the commercial salt. This may be done by the process formerly official:

Take of Commercial Bicarbonate of Sodium, in powder, 64 oz. av.; Distilled Water, 6 pints. Introduce the powder into a suitable conical glass percolator, cover it with a piece of wet muslin, and pour the Water gradually upon it. When the liquid has ceased to drop, or when the washings cease to precipitate a solution of Sulphate of Magnesium, remove the Bicarbonate of Sodium from the percolator, and dry it on bibulous paper, in a warm place.

This purification amounts to nothing more than washing the salt with distilled water. The common impurities, sodium carbonate, chloride, and sulphate, and ammonium salts, are much more soluble than the bicarbonate, and they are easily dissolved out, without any serious loss of the bicarbonate. Alcohol is sometimes substituted for water for dissolving the carbonate.

Sodii Bicarbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A white, opaque powder, permanent in dry air, but slowly decomposed in moist air. When heated, the salt is decomposed into normal carbonate, water, and carbon dioxide, and finally, at 100° C. (212° F.), loses about 36.3 per cent. of its weight. At a bright red heat it melts. To a non-luminous flame it imparts an intensely yellow color.	Odorless; cooling, mildly alkaline taste; slightly alkaline reaction.	At 15° C. (59° F.), 11.3 parts. Boiling, Decomposed.	Insoluble.	Insoluble in ether.

TESTS FOR PURITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If Sodium Bicarbonate be heated in a test-tube, no ammoniacal vapor should be emitted.</p> <p>To neutralize 0.85 Gm. of Sodium Bicarbonate should require not less than 10 C.c. of normal sulphuric acid (corresponding to at least 98.6 per cent. of the pure salt), methyl-orange being used as indicator.</p> <p>The solution, when freshly prepared with cold, distilled water, without shaking, gives a very faint alkaline reaction upon litmus paper. The alkalinity increases by standing, agitation, or increase of temperature. With acids the solution effervesces strongly.</p>	Sulphocyanate.	<p>If 5 C.c. of the aqueous solution (1 in 20) be slightly supersaturated with hydrochloric acid, the liquid should not be colored red by a drop of ferric chloride T.S.</p> <p>If 1 Gm. of the salt be dissolved in 3 C.c. of acetic acid, it should yield no precipitate within an hour after being mixed with 0.5 C.c. of sodium cobaltic nitrite T.S.</p> <p>If 0.6 Gm. of the salt be dissolved, without agitation, in 10 C.c. of cold water, and 0.1 C.c. of normal sulphuric acid added, no red color should appear upon the addition of 2 drops of phenolphthalein T.S.</p> <p>If 5 C.c. of the aqueous solution (1 in 20) be slightly supersaturated with hydrochloric acid, the solution should not be rendered turbid by the addition of an equal volume of hydrogen sulphide T.S., either at once, Or after the addition of ammonia water in slight excess.</p> <p>Five C.c. of the aqueous solution, acidulated with acetic acid, should not be rendered turbid by 0.5 C.c. of ammonium oxalate T.S.</p>
	Limit of Potassium.	
	Limit of Normal Carbonate.	
	Arsenic.	
	Iron, Aluminum, etc.	
	Calcium.	

TESTS.—(Continued.)

TESTS FOR PURITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 1 Gm. of the salt be dissolved in 19 C.c. of water, it should yield a perfectly clear and colorless solution, leaving no residue.	Limit of Chloride.	If 1.2 Gm. of Sodium Bicarbonate be dissolved in 10 C.c. of diluted nitric acid, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of silver nitrate V.S.
	Limit of Sulphate, Sulphite, and Hyposulphite.	If 2.5 Gm. of the salt be dissolved in 11 C.c. of diluted hydrochloric acid, then 0.1 C.c. of nitric acid and 0.1 C.c. of barium chloride T.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.

Uses.—If *official* sodium bicarbonate were universally used, the preparations into which the commercial article now enters would be largely deprived of the disagreeable, bitter taste which is caused by the presence of carbonate. Sodium bicarbonate is largely used as a safe antacid, in doses of ten to fifteen grains (0.6 to 0.9 Gm.). It is preferably administered in carbonic acid water, and the draught is popularly known as “extra soda.” The misnomer is caused by the erroneous use of the term “soda water.”

SODII BISULPHIS. U. S. Sodium Bisulphite.

Preparation.—The acid sodium sulphite is used in solution in the arts, but, owing to its unstable character, it is inferior to the normal sulphite. It is prepared by passing sulphurous acid gas into a solution of sodium carbonate until saturation takes place and all the carbon dioxide is expelled: the liquid is then evaporated, and the crystals which form on cooling are washed and dried.

It is converted by exposure to the air into sulphate and carbonate. It is largely manufactured for use in the arts as an *antichlor*, to neutralize the effects of the chlorine used in bleaching fabrics.

Sodii Bisulphis. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Opaque, prismatic crystals, or a granular powder, slowly oxidizing to sulphate and losing sulphur dioxide on exposure to air. When strongly heated, the salt decrepitates, emits vapors of sulphur and of sulphur dioxide, and leaves a residue of sodium sulphate. A small fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Sulphur dioxide odor; disagreeable, sulphurous taste; acid reaction.	At 15° C. (59° F.), 4 parts. Boiling, 2 parts.	At 15° C. (59° F.), 72 parts. Boiling, 49 parts.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
On the addition of hydrochloric or sulphuric acid, the aqueous solution of the salt evolves sulphur dioxide, which is recognized by its odor, and by its blackening a strip of paper dipped into mercurous nitrate T.S. and held over the escaping gas.	Limit of Chloride.	If 1.2 Gm. of Sodium Bisulphite be dissolved in 10 C.c. of diluted nitric acid, and the solution heated sufficiently to expel the gases, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of silver nitrate V.S.
If 0.26 Gm. of Sodium Bisulphite be dissolved in 20 C.c. of water, recently boiled to expel air, and a little starch T.S. be added, at least 45 C.c. of decinormal iodine V.S. should be required to produce a permanent blue tint after agitation (corresponding to at least 90 per cent. of pure Sodium Bisulphite).	Hyposulphite.	If 2.5 Gm. of Sodium Bisulphite be dissolved in 11 C.c. of diluted hydrochloric acid with the aid of sufficient heat to expel the sulphur dioxide, the solution should not be turbid.
	Limit of Sulphate.	After adding to it 0.15 C.c. of barium chloride T.S. and removing the precipitate, if any, by filtration, a portion of the clear filtrate should remain unaffected by the addition of more barium chloride T.S.
	Arsenic.	If to 5 C.c. of the preceding filtrate an equal volume of hydrogen sulphide T.S. be added, no turbidity or coloration should occur.

Uses.—Sodium bisulphite is used as an antiseptic and antiferment, in doses of five to ten grains (0.3 to 0.6 Gm.). The sulphite, however, is usually preferred.

SODII BORAS. U.S. Sodium Borate.

[BORAX.]

Preparation.—This salt is found in immense quantities in California as a crystalline deposit in the blue mud of an offset of Clear Lake. It is probable that this will continue to be the principal source of borax for many years to come. The process of purification consists simply in picking the large and perfect crystals out, washing them, and lixiviating the earth, which is strongly impregnated with borax, evaporating the solution, and crystallizing. It is sometimes called *biborate of sodium*.

Borax is found native in Thibet, Persia, and other localities. It is sometimes called *tincal*. Crude boric acid, obtained from Tuscany, is fused with dried sodium carbonate, and a hot solution of the residue is crystallized in order to produce borax.

Sodii Boras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent, monoclinic prisms, or a white powder, slightly efflorescent in dry air. When heated, the powdered salt begins to lose water, then melts, on further heating swells up and forms a white, porous mass, which, at a red heat, fuses to a colorless glass, with complete loss of water of crystallization (47.14 per cent.).	Odorless; sweetish, alkaline taste; alkaline reaction.	At 15° C. (59° F.), 16 parts. Boiling, 0.5 part.	Insoluble.	At 80° C. (176° F.) it is soluble in 1 part of glycerin.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A fragment of the salt imparts an intensely yellow color to a non-luminous flame. The aqueous solution (1 in 20) colors red litmus paper blue, and yellow turmeric paper reddish-brown. After being acidulated with hydrochloric acid, the solution colors blue litmus paper red; yellow turmeric paper remains unchanged at first, but, on drying, becomes brownish-red, and this color is temporarily changed to bluish-black by moistening with ammonia water.</p> <p>If a drop of the solution of the salt in glycerin be held in the flame, a transient bright green color will appear.</p> <p>If a slight excess of sulphuric acid be added to a hot, saturated aqueous solution of the salt, shining, scaly crystals of boric acid will separate on cooling, which impart a green color to the flame of alcohol.</p> <p>With 19 C.c. of water, 1 Gm. of the salt should yield a perfectly clear and colorless solution, leaving no residue.</p>	<p>Carbonate.</p> <p>Iron, Aluminium, etc.</p> <p>Arsenic, Lead, etc.</p> <p>Calcium.</p> <p>Phosphate.</p> <p>Limit of Chloride.</p> <p>Limit of Sulphate.</p> <p>Nitrate.</p>	<p>The aqueous solution (1 in 20) should not effervesce with acids.</p> <p>It should not be rendered turbid by ammonium sulphide T.S.,</p> <p>Nor, after being acidulated with hydrochloric acid, by an equal volume of hydrogen sulphide T.S.</p> <p>When acidulated with acetic acid, the solution should not be rendered turbid by ammonium oxalate T.S.</p> <p>The aqueous solution (1 in 20) should not be rendered turbid by magnesia mixture.</p> <p>If 0.48 Gm. of the salt be dissolved in 15 C.c. of water, then 1 C.c. of diluted nitric acid and 0.2 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of silver nitrate V.S.</p> <p>If 2.5 Gm. of the salt be dissolved in 50 C.c. of water, then 10 C.c. of diluted hydrochloric acid and 0.1 C.c. of barium chloride T.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.</p> <p>If 1 Gm. of the salt be dissolved in 20 C.c. of diluted sulphuric acid by the aid of heat, and three drops of indigo T.S. be added, the blue color should not be discharged.</p>

Uses.—Borax, as it is almost universally called, is antacid and diuretic. It enters into many mouth-washes, and is frequently applied in the form of powder to ulcers in the mouth, for which purpose it is admirably adapted, being mildly alkaline and not very soluble. Pharmaceutically, it is frequently used in small quantity to whiten ointments, particularly the ointment of rose-water. It is used for this purpose by dissolving it in water, and incorporating the solution.

SODII BROMIDUM. U. S. Sodium Bromide.

NaBr; 102.76.

Preparation.—The process most used in making this salt is by decomposing ferrous bromide by treating it with sodium carbonate. The ferrous bromide is made by acting on iron wire with bromine in the presence of water, and, after filtering the solution, adding solution of sodium carbonate. The reaction may be thus expressed :

Sodium bromide may also be made by first producing ammonium bromide by treating a solution of ammonia with bromine (see Ammonii Bromidum), and then by double decomposition with sodium carbonate,

forming sodium bromide and ammonium carbonate. The solution, by careful evaporation and granulation, may be made to yield sodium bromide, whilst ammonium carbonate, being composed of volatile compounds, is dissipated by the amount of heat used to granulate the sodium salt.

Sodii Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless or white, cubical crystals, or a white, granular powder. From the air the salt attracts water without deliquescing. When heated to a dull red heat, the salt melts without losing weight. At a full red heat it is slowly volatilized without decomposition. A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Odorless; saline, slightly bitter taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 1.2 parts. Boiling, 0.5 part.	At 15° C. (59° F.), 13 parts. Boiling, 11 parts.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If a few drops of chloroform be poured into 10 C.c. of the aqueous solution (1 in 20), then 1 C.c. of chlorine water added, and the mixture agitated, the liberated bromine will dissolve in the chloroform, imparting to it a yellow or brownish-yellow color, without a violet tint.	Limit of Potassium.	The aqueous solution (1 in 20) should be clear and colorless, and should not be rendered turbid by sodium bitartrate T.S., nor by sodium cobaltic nitrite T.S., Nor by ammonium oxalate T.S., Nor by barium chloride T.S.
	Calcium Sulphate.	
	Arsenic, Lead, etc.	If the aqueous solution be slightly acidulated with hydrochloric acid, it should not be rendered turbid by the addition of an equal volume of hydrogen sulphide T.S. either at once, Or after adding ammonia water in slight excess.
	Iron, Aluminium, etc.	
	Bromate.	If diluted sulphuric acid be dropped upon some of the powdered salt, no yellow color should appear at once.
	Iodine.	If 5 C.c. of the aqueous solution (1 in 20) be mixed with a few drops of starch T.S., and then 0.5 C.c. of chlorine water be added, no blue color should appear.
	Limit of Moisture.	If 1 Gm. of the powdered salt be kept for twenty minutes at the temperature of 100° C. (212° F.), or slightly above it, it should not lose more than 0.03 Gm. in weight.
	More than 2.71 per cent. of Chloride.	If 0.3 Gm. of the well-dried salt be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should not require more than 29.8 C.c. of decinormal silver nitrate V.S. to produce a permanent red color.

Uses.—Sodium bromide is used for the same purposes as potassium bromide. It is probably inferior to the latter as a nervous sedative, although frequently combined with it. The dose is thirty to sixty grains (1.9 to 3.8 Gm.).

SODII CARBONAS. U. S. Sodium Carbonate.

Preparation.—Impure sodium carbonate, or soda-ash, is consumed in enormous quantities in the arts, and cheap methods of production have been long sought for. The process elaborated by Leblanc in 1784,

a French apothecary, has been most largely used, and it possesses a historic interest because of the public endorsements which it received from the French government in 1794. It is remarkable that this process has been successfully worked, without material modifications, *for a century*, and has supplied the world with cheap soap and cheap glass. It also furnishes a striking illustration of the unrequited labors of inventors and benefactors, from the fact that Leblanc died a pauper in a French asylum. Sodium carbonate is made from common salt by two steps: first, by converting the salt by sulphuric acid into sodium sulphate, and, secondly, by decomposing the sulphate by calcium carbonate and charcoal at a high temperature, so as to yield sodium carbonate. The chemical reactions are as follows:

The sulphate, first dried, is mixed with its own weight of ground limestone, and half its weight of small coal, ground and sifted, and the whole is heated in a reverberatory furnace, where it fuses and forms a black mass. The coal, at the temperature employed, converts the sodium sulphate into sodium sulphide. This reacts with the limestone, so as to form calcium sulphide and sodium carbonate. The black mass is next digested in warm water, which takes up the alkali and other soluble matters, and leaves the insoluble impurities, called *soda waste*, largely utilized in the manufacture of sodium hyposulphite. The solution is evaporated to dryness, and the mass obtained is calcined with one-fourth of its weight of sawdust, to convert the alkali fully into carbonate, by means of the carbonic acid resulting from the combustion of the sawdust. The product is redissolved in water, and the solution evaporated to dryness. This soda-ash contains about 50 per cent. of sodium carbonate.

Solvay's process for making sodium bicarbonate is given on page 559; the bicarbonate is easily converted into carbonate by heating, and the carbon dioxide is utilized in another part of the process.

The cryolite process is used largely in the United States. Cryolite, $\text{Al}_2\text{F}_6 + 6\text{NaF}$, consists mainly of a double fluoride of aluminium and sodium, containing in 100 parts 13 of aluminium, 34 of sodium, and 53 of fluorine. Sodium carbonate is obtained by heating cryolite with chalk, whereby calcium fluoride is formed, while the sodium and aluminium combine to form sodium aluminate, a weak salt, which is dissolved out by lixiviation. The soda is converted into carbonate by passing carbon dioxide under pressure through the solution; and the alumina, separated from the soda, becomes insoluble, and is deposited.

Very excellent sodium bicarbonate is now obtained from England and Germany, there being much competition among the manufacturers to produce the salt cheaply and of good quality.

Sodii Carbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, monoclinic crystals, rapidly efflorescing in dry air, and, if exposed, soon loses about half of its water of crystallisation (31.46 per cent. of its weight), and becomes a white powder. When heated to 32.5° C. (90.5° F.), the crystals fuse in their water of crystallisation, and lose some water. At a higher temperature, the salt continues to lose water, until, at last, an anhydrous residue is left, corresponding to 37 per cent. of the weight of the crystals. At a bright red heat the anhydrous salt fuses. To a non-luminous flame it imparts an intensely yellow color.	Odorless; strongly alkaline taste; alkaline reaction, effervescing strongly with acids.	At 15° C. (59° F.), 1.6 parts. At 38° C. (100.4° F.), 0.09 part. Boiling, 0.2 part.	Insoluble.	Insoluble in ether. Soluble in 1.02 parts of glycerin.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 5-per-cent. aqueous solution of the salt should be perfectly clear and colorless, leaving no insoluble residue.</p> <p>If the crystallized salt be heated in a test-tube, the vapor of ammonia should not be evolved.</p> <p>To neutralise 1 Gm. of anhydrous Sodium Carbonate (deprived of its water of crystallisation by heat immediately before being weighed) should require not less than 18.7 C.c. of normal sulphuric acid (corresponding to not less than 98.9 per cent. of the pure salt), methyl-orange being used as indicator.</p>	Sulphocyanate.	If 5 C.c. of the aqueous solution (1 in 20) be slightly supersaturated with hydrochloric acid, the liquid should not be colored red by a drop of ferric chloride T.S.
	Arsenic, Lead, Iron, Aluminium, etc.	If to 5 C.c. of the aqueous solution, slightly supersaturated with hydrochloric acid, an equal volume of hydrogen sulphide T.S. be added, no turbidity should be produced either before or after the addition of ammonia water in slight excess.
	Calcium.	If 5 C.c. of the aqueous solution be slightly supersaturated with acetic acid, the addition of 0.5 C.c. of ammonium oxalate T.S. should produce no turbidity.
	Limit of Potassium.	If 5 C.c. of the aqueous solution be slightly supersaturated with acetic acid, the addition of 0.5 C.c. of sodium cobaltic nitrite T.S. should not render it turbid within one hour.
	Limit of Chloride.	If 1.2 Gm. of the salt be dissolved in 10 C.c. of diluted nitric acid, then 0.5 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by further addition of silver nitrate V.S.
	Limit of Sulphate, Sulphite, and Hyposulphite.	If 2.5 Gm. of the salt be dissolved in 10 C.c. of diluted hydrochloric acid, then 0.1 C.c. of nitric acid and 0.1 C.c. of barium chloride T.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S.

Uses.—Sodium carbonate is one of the most useful of the alkaline salts: it is the source of most of the sodium salts made by the pharmacist. It is important in this connection not to use the effloresced carbonate, as it is stronger in proportion to the amount of water that it has lost. It is rarely given internally, on account of its disagreeable taste. The dose is from ten to twenty grains (0.6 to 1.2 Gm.).

SODII CARBONAS EXSICCATUS. U. S. Dried Sodium Carbonate.

	Metric.	Old form.
Sodium Carbonate	200 Gm.	82 oz. av.
To make	100 Gm.	16 oz. av.

Break the crystals into small fragments, and allow them to effloresce for several days in warm air, at a temperature not exceeding 25° C. (77° F.), until they are completely disintegrated; then dry the white powder at a temperature of about 45° C. (113° F.), until its weight is reduced to 100 Gm. [old form 16 oz. av.]. Pass the powder through a sieve, and preserve it in well-stoppered bottles.

The theoretical proportion of water in official sodium carbonate is nearly 63 per cent., so that the exsiccated carbonate still retains some water of crystallization. It is a white, hygroscopic powder, corresponding to the tests of purity under Sodii Carbonas. It is, of course, of twice the strength of sodium carbonate. To neutralize 1 Gm. of Dried Sodium Carbonate should require not less than 13.8 C.c. of normal sulphuric acid (corresponding to about 73 per cent. of anhydrous sodium carbonate).

Uses.—The object of driving off water from sodium carbonate is to furnish a more uniform product, and to render the dose, when administered in pill or powder form, less bulky. The dose is from five to ten grains (0.3 to 0.6 Gm.).

SODII CHLORAS. U. S. Sodium Chlorate.

Preparation.—This salt is usually prepared by Wittstein's process, which consists in first preparing acid sodium tartrate by adding a strong solution containing nine and a half parts of tartaric acid to a hot aqueous solution of nine parts of sodium carbonate. The hot solution is mixed with one in which eight parts of potassium chlorate have been dissolved. Acid potassium tartrate separates, whilst sodium chlorate remains in solution. The filtered solution is evaporated and crystallized. If desired of absolute purity, it may be recrystallized from an alcoholic solution.

Owing to the facility with which this salt parts with its oxygen, the following official cautionary direction should be borne in mind: "Sodium Chlorate should be kept in glass-stoppered bottles, and *great caution* should be observed in handling the salt, as dangerous explosions are liable to occur when it is mixed with organic matters (cork, tannic acid, sugar, etc.), or with sulphur, antimony sulphide, phosphorus, or other easily oxidizable substances, and either heated directly, or subjected to trituration or concussion."

Sodii Chloras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent crystals (principally regular cubes with tetrahedral facets), or a crystalline powder, permanent in dry air. When heated, the salt melts and gives off oxygen (about 45 per cent. of its weight), finally leaving a residue of sodium chloride, readily soluble in water, and yielding, with silver nitrate T.S., a white, curdy precipitate, insoluble in nitric acid.	Odorless; cooling, saline taste; neutral reaction.	At 15° C. (59° F.), 1.1 parts. Boiling, 0.5 part.	At 15° C. (59° F.), 100 parts. Boiling, 40 parts.	Soluble in 5 parts of glycerin.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
It imparts to a non-luminous flame an intensely yellow color.	Limit of Potassium.	{ A saturated, aqueous solution should not be rendered turbid by sodium bitartrate T.S. An aqueous solution of the residue left after igniting a portion of the salt should not give an alkaline reaction upon litmus paper.
When a crystal of the salt is dropped into hydrochloric acid, the liquid assumes a deep greenish-yellow color, and emits the odor of chlorine.	Tartrate.	
	Arsenic, Lead, etc.	{ The aqueous solution (1 in 20), slightly acidulated with acetic acid, should not be rendered turbid by the addition of an equal volume of hydrogen sulphide T.S., either at once, Or after the addition of ammonia water in slight excess.
	Iron, Aluminium, etc.	
	Magnesium, etc.	{ The aqueous solution (1 in 20) should not be rendered turbid by adding to it a few drops of ammonia water and then sodium phosphate T.S. The solution (1 in 20), slightly acidulated with acetic acid, should not be rendered turbid by ammonium oxalate T.S.
	Calcium.	
	Sulphate.	{ Nor by barium chloride T.S. Nor should silver nitrate T.S. produce in it more than a slight opalescence.
	Limit of Chloride.	

Uses.—This salt has an advantage over potassium chlorate in point of solubility, thus permitting the use of stronger solutions. The dose is from ten to twenty grains (0.6 to 1.2 Gm.).

SODII CHLORIDUM. U.S. Sodium Chloride.

NaCl; 58.87.

Preparation.—Common salt is universally distributed over the world, and may be mined, as rock salt, or obtained by evaporating sea-water.

Sodii Chloridum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent, cubical crystals, or a white, crystalline powder, permanent in dry air. When heated, the salt decrepitates; at a red heat it fuses, and at a still higher temperature it is slowly volatilized, with partial decomposition. A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Odorless; purely saline taste; neutral reaction.	At 15° C. (59° F.), 2.8 parts. Boiling, 2.5 parts.	Almost insoluble.	Insoluble in ether or chloroform.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
With silver nitrate T.S. the solution yields a white, curdy precipitate insoluble in nitric acid.	Limit of Potassium.	No turbidity should be produced in 5 C.c. of the aqueous solution (1 in 20) by the addition of 0.5 C.c. of sodium cobaltic nitrite T.S.,
If 0.195 Gm. of well-dried Sodium Chloride be dissolved in 10 C.c. of water, and the solution mixed with a few drops of potassium chromate T.S., it should require not less than 33.4 C.c. of decinormal silver nitrate V.S. to produce a permanent red color (corresponding to at least 99.9 per cent. of the pure salt).	Magnesium, etc.	Nor by the addition of sodium phosphate T.S. and a few drops of ammonia water.
	Calcium.	The aqueous solution, slightly acidulated with acetic acid, should not be rendered turbid by ammonium oxalate T.S.,
	Sulphate.	Nor by barium chloride T.S.,
	Arsenic, Lead, Zinc, Iron, Aluminium, etc.	Nor by an equal volume of hydrogen sulphide T.S., either before or after addition of ammonia water in slight excess.
	Iodide or Bromide.	If 2 Gm. of the finely powdered salt be digested for some hours with 25 C.c. of warm alcohol, and, after cooling, the undissolved salt be removed by filtration, then the filtrate evaporated to dryness and the residue dissolved in 1 C.c. of water and mixed with a few drops of starch T.S., the addition of chlorine water, drop by drop, should produce neither a blue nor a yellow tint.

Uses.—Sodium chloride is largely used as a condiment and an antiseptic. It undoubtedly serves a useful purpose in the animal economy, as many animals possess an instinctive craving for it. Salt baths are tonic, and valuable aids in many diseases. Common salt is used as a styptic in hemorrhage.

SODII HYPOPHOSPHIS. U. S. Sodium Hypophosphite.

Preparation.—This salt is prepared by mixing a solution of six ounces of calcium hypophosphite in four pints of water with a solution of ten ounces of sodium carbonate in one and a half pints of water.

Double decomposition takes place, with the formation of calcium carbonate and sodium hypophosphite, of which the latter is held in solution, and the former precipitated. After filtration to separate the calcium carbonate, the solution is evaporated to a pellicle, and then stirred constantly till the salt granulates, the heat being continued. If required quite pure, the granulated salt is dissolved in official alcohol, and the liquid, having been evaporated to a syrupy consistence, is set aside to crystallize.

Sometimes the sodium hypophosphite explodes with violence during the evaporation of its solution. This was ascribed to the use of too high a heat; but the same accident has occurred when the heat was applied by means of a water-bath. Evaporation, therefore, should be performed below 100° C. (212° F.).

The gases evolved by heat are hydrogen and hydrogen phosphide. The latter is well known to be spontaneously inflammable.

The acid present in this salt is *hypophosphorous acid*. It consists of one atom of phosphorus, two atoms of oxygen, and three atoms of hydrogen, only one of the latter being replaceable by a metal.

This acid is a powerful deoxidizer: as it reduces mercury and silver from their combinations, it should not be prescribed with either. The solubility of sodium hypophosphite and of other hypophosphites is increased by the addition of hypophosphorous acid. (See p. 305.)

Sodii Hypophosphis. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Small, colorless, transparent, rectangular plates of a pearly lustre, or a white granular powder, very deliquescent on exposure to air. When heated in a test-tube, the salt at first loses its water of crystallization, and at about 200° C. (392° F.) it is decomposed, evolving hydrogen and hydrogen phosphide, which burn with a bright yellow flame, and leaving a residue of sodium pyrophosphate and metaphosphate, sometimes mingled with a little red phosphorus. To a non-luminous flame the salt communicates an intensely yellow color.	Odorless; bitterish, sweet, saline taste; neutral reaction.	At 15° C. (59° F.), 1 part. Boiling, 0.12 part.	At 15° C. (59° F.), 30 parts. Boiling, 1 part.	Slightly soluble in absolute alcohol. Insoluble in ether.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
On triturating or heating Sodium Hypophosphite with nitrates, chlorates, or other oxidizing agents, it detonates violently.	Limit of Potassium.	A solution of 0.5 Gm. of the salt in 1 C.c. of water should yield no precipitate upon the addition of 1 C.c. of sodium bitartrate T.S. The aqueous solution (1 in 20) should not be colored red by the addition of a drop of phenolphthalein T.S., nor effervesce on the addition of an acid. Nor should it be rendered turbid by ammonium oxalate T.S. In the aqueous solution (1 in 20), acidulated with hydrochloric acid, an equal volume of hydrogen sulphide T.S. should not produce any turbidity. After heating 10 C.c. of the aqueous solution (1 in 20) with 1 C.c. of nitric acid, separate portions of the solution should remain clear upon the addition of silver nitrate T.S. And of barium chloride T.S. Not more than a slight cloudiness should be produced in the aqueous solution of the salt by magnesia mixture. Potassium ferrocyanide T.S. should not produce in the acidulated solution any blue color.
A 5-per-cent aqueous solution of the salt yields, with silver nitrate T.S., a white precipitate, which rapidly turns brown or black, owing to the separation of metallic silver.	Caustic Alkali or Carbonate.	
When an aqueous solution of the salt (1 in 20), acidulated with hydrochloric acid, is added in small quantity to an excess of mercuric chloride T.S., a white precipitate of mercurous chloride is formed. On further addition of the solution, the precipitate is reduced to metallic mercury.	Calcium.	
If 0.1 Gm. of dry Sodium Hypophosphite be dissolved in 10 C.c. of water, mixed with 7.5 C.c. of sulphuric acid and 40 C.c. of decinormal potassium permanganate V.S., and the mixture boiled for fifteen minutes, it should require not more than 3 C.c. of decinormal oxalic acid V.S. to discharge the red color (corresponding to at least 97.96 per cent. of the pure salt).	Arsenic, Lead, etc.	
	Chloride.	
	Sulphate.	
	Limit of Phosphate.	
	Iron.	

Uses.—Sodium hypophosphite is used in exhausted conditions of the nervous system; in pharmacy, solely as an ingredient in syrup of the hypophosphites.

SODII HYPOSULPHIS. U. S. Sodium Hyposulphite.

Preparation.—Sodium hyposulphite, or, more correctly, *sodium thiosulphate*, is made by decomposing soluble calcium thiosulphate, obtained by the oxidation of alkali waste, with either sodium sulphate or sodium carbonate.

Other methods of making "hyposulphite of soda" have been used, but the above process has superseded them because of its economy. It is now made on a very large scale.

Sodii Hyposulphatis. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent, monoclinic prisms. Permanent in the air below 33° C. (91.4° F.), but efflorescent in dry air above that temperature. When rapidly heated to about 50° C. (122° F.), the salt melts; when slowly heated until it is effloresced, and afterwards to 100° C. (212° F.), it loses all its water (36.3 per cent.), and at a low red heat it is decomposed, sulphur being evolved, while a residue of sodium sulphide and sulphate remains. A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Odorless; cooling, somewhat bitter taste; neutral reaction.	At 15° C. (59° F.), 0.65 part. At 20° C. (68° F.), 0.5 part. Boiling, rapidly decomposed.	Insoluble.	Slightly soluble in oil of turpentine.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

An aqueous solution of the salt readily dissolves many salts of silver (chloride, bromide, iodide, oxide, etc.), and discharges the color of a solution of iodine or of starch iodide.

If ferrie chloride T.S. be dropped into the aqueous solution (1 in 20), a dark violet color will be produced, which disappears rapidly on agitation.

Addition of sulphuric or hydrochloric acid to the aqueous solution liberates from it sulphur dioxide (known by its odor, and by its blackening a strip of paper moistened with mercurous nitrate T.S. and held in the escaping gas), and causes a white precipitate of sulphur (distinction from *sulphite* or *bisulphite*).

If 0.25 Gm. of Sodium Hyposulphite be dissolved in 10 C.c. of water and a few drops of starch T.S. added, it should require at least 9.9 C.c. of decinormal iodine V.S. to produce a permanent blue color (corresponding to at least 98.1 per cent. of the pure salt).

IMPURITIES.

TESTS FOR IMPURITIES.

Lead, Iron, etc.

Calcium.

Caustic Alkali or Carbonate.

Sulphide.

Sulphate.

If to 5 C.c. of the aqueous solution (1 in 20) an equal volume of hydrogen sulphide T.S. be added, no coloration or turbidity should be perceptible either before or after the addition of 1 C.c. of ammonia water.

The aqueous solution should not be rendered turbid by the addition of ammonium oxalate T.S.

The aqueous solution of the salt (1 in 20) should not be colored red by a drop of phenolphthalein T.S.

Nor should a drop of silver nitrate T.S. produce a brown or a black precipitate in 5 C.c. of this solution.

In a dilute aqueous solution (1 in 80), barium chloride T.S. should produce no turbidity.

Uses.—This compound is used in the official volumetric test of sodium hyposulphite, and occasionally in medicine, as an alterative and resolvent, in doses of ten to thirty grains (0.6 to 1.9 Gm.). Externally, it is used in baths, and also as an ointment. Its principal use is in the arts, as an *antichlor* in paper manufacture; whilst in photography, under the abbreviated name of “hypo,” it is invaluable as a solvent for the unaltered silver chloride or bromide in the film.

SODII IODIDUM. U. S. Sodium Iodide.

NaI; 149.53.

Preparation.—This iodide may be prepared by double decomposition between solutions of ferrous iodide and sodium carbonate, or by treating a solution of sodium hydrate with iodine, exactly as in the preparation of potassium iodide. The former process is preferable if working on a small scale.

By boiling the solution containing the ferrous carbonate the latter is rendered less bulky, and it can be easily separated by filtration.

Sodii Iodidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, cubical crystals, or a white, crystalline powder. In moist air it deliquesces and becomes partially decomposed into sodium carbonate and free iodine, assuming, thereby, a reddish color. At a dull red heat the salt melts. At a full red heat it is slowly volatilized, with partial decomposition. A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Odorless; saline and slightly bitter taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 0.6 part. Boiling, 0.33 part.	At 15° C. (59° F.), 3 parts. Boiling, 1.4 parts.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If to 5 C.c. of the aqueous solution (1 in 20) 1 C.c. of chlorine water be added, iodine will be liberated and impart to the solution a yellow color. On agitating this mixture with a few drops of chloroform, the latter will acquire a violet color.	More than 5 per cent. of Water.	If the salt be in distinct crystals, only a few monoclinic prisms (containing 2 molecules of water) should be found among the regular cubes of the anhydrous salt. On drying 1 Gm. of the salt at 100° C. (212° F.), it should not lose more than 0.05 Gm. in weight.
	Limit of Potassium.	
	Calcium.	The aqueous solution (1 in 20), slightly acidulated with acetic acid, should remain clear after the addition of ammonium oxalate T.S.
	Arsenic, etc.	Or of an equal volume of hydrogen sulphide T.S.
	Zinc, Iron, Aluminum, etc.	The addition of ammonium sulphide T.S. should not produce either a coloration or a turbidity in the aqueous solution.
	Limit of Alkali.	If 1 Gm. of the salt be dissolved in water, and 0.05 C.c. (1 drop) of decinormal oxalic acid V.S. be added, no red color should be produced by the addition of a drop of phenolphthalein T.S.
	Iron.	The aqueous solution, slightly acidulated with hydrochloric acid, should not be colored blue upon the addition of potassium ferrocyanide T.S.

TESTS.—Continued.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 0.5 Gm. of the well-dried salt be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should not require more than 34.5 C.c. nor less than 33.4 C.c. of decinormal silver nitrate V.S. to produce a permanent red color, corresponding to at least 98 per cent. of the pure salt.	Free Iodine.	If 0.5 Gm. of the salt be dissolved in 10 C.c. of freshly boiled distilled water, and the solution mixed with a few drops of starch T.S., no blue color should appear either at once Or after the addition of a drop of diluted hydrochloric acid.
	Iodate.	
	Sulphate.	If 5 C.c. of the aqueous solution (1 in 20) be acidulated with hydrochloric acid, and 0.5 C.c. of barium chloride T.S. be added, no immediate turbidity should appear.
	Cyanide.	If 5 C.c. of the aqueous solution be gently heated with 1 drop of ferrous sulphate T.S. and 0.5 C.c. of potassium hydrate T.S., no blue color should appear after acidulating the mixture with hydrochloric acid.
	Nitrate or Nitrite.	If 1 Gm. of the salt be mixed with 0.5 Gm. of iron filings and 0.5 Gm. of powdered zinc, and heated in a test-tube with 5 C.c. of sodium hydrate T.S., no ammoniacal vapors should be evolved.

Uses.—Medicinally, this salt is preferred to potassium iodide by some practitioners, although apparently without good reasons. The dose is from five to fifteen grains (0.3 to 0.9 Gm.).

SODII NITRAS. U. S. Sodium Nitrate.

NaNO_3 ; 84.89.

Preparation.—Sodium nitrate, called also *cubic nitre*, and *Chili saltpetre*, is a native salt found in Chili and Peru, purified by crystallization from its aqueous solution. It is the cheapest source for obtaining nitrates, as explained elsewhere (see Acidum Nitricum).

Sodii Ntras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, rhombohedral crystals. Deliquescent in damp air. When heated to about 312° C. (593.6° F.), the salt melts without decomposition. At a higher temperature it evolves oxygen and is reduced to nitrite.	Odorless; cooling, saline, and slightly bitter taste; neutral reaction.	At 15° C. (59° F.), 1.3 parts. Boiling, 0.6 part.	At 15° C. (59° F.), 100 parts. Boiling, 40 parts.

Thrown upon red-hot coals, the salt deflagrates. A fragment of the salt imparts to a non-luminous flame an intensely yellow color. If the aqueous solution be mixed in a test-tube with a drop of diphenylamine T.S., and sulphuric acid be carefully poured in, so as to form a separate layer, a deep blue color will appear at the line of contact.	Limit of Potassium.	A solution of 0.5 Gm. of the salt in 1 C.c. of water should not be precipitated or rendered turbid by 1 C.c. of sodium bitartrate T.S.
	Arsenic and Metallic Impurities.	
	Calcium, Magnesium, etc.	The aqueous solution (1 in 20) should not be colored or rendered turbid by the addition of hydrogen sulphide T.S. or ammonium sulphide T.S. Nor by the addition of equal parts of ammonia water and sodium phosphate T.S.
	Iodate and Iodide.	If the aqueous solution be mixed with a few drops, each, of hydrogen sulphide T.S. and starch T.S., and then some chlorine water poured carefully upon the mixture, no blue color should appear at the line of contact.
	Sulphate.	No turbidity should be produced within five minutes in the aqueous solution, acidulated with nitric acid, on the addition of barium chloride T.S.
	Chloride.	Or silver nitrate T.S.

Uses.—Sodium nitrate is used in a number of diseases, such as epilepsy, angina pectoris, dysentery, etc., but without marked effects. The dose is fifteen to twenty grains (0.9 to 1.2 Gm.).

SODII NITRIS. U. S. Sodium Nitrite.

Preparation.—Sodium nitrite has been made official solely on account of its use in preparing spirit of nitrous ether. It is made by heating sodium nitrate in contact with starch, or preferably by adding strips of sheet-lead to sodium nitrate heated to the fusing point for several hours, lead oxide being formed at the same time. After cooling, the fused sodium nitrite is lixiviated with water, purified, and recrystallized.

Sodii Nitr. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
White, opaque, fused masses, usually in the form of pencils, or colorless, transparent, hexagonal crystals. When exposed to the air, the salt deliquesces and is gradually oxidized to sodium nitrate. When heated, the salt melts, and at a red heat it is decomposed, yielding oxygen, nitrogen, nitrogen dioxide, and sodium oxide. To a non-luminous flame it imparts an intensely yellow color.	Odorless; mild, saline taste; alkaline reaction.	At 15° C. (59° F.), 1.5 parts. Boiling, Very soluble.	Slightly soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If the aqueous solution of the salt be mixed with some potassium iodide T.S., and a few drops of acid added, iodine will be liberated, and nitrogen dioxide gas will escape with effervescence.</p> <p>If 0.15 Gm. of Sodium Nitrite be dissolved in 5 C.c. of water, and introduced into a nitrometer, then followed by a solution of 1 Gm. of potassium iodide in 6 C.c. of water and 15 C.c. of normal sulphuric acid, the liberated nitrogen dioxide gas should measure not less than 50 C.c. at 15° C. 	Iodide.	
	Lead, Arsenic, Copper, etc.	

SODII PHOSPHAS. U. S. Sodium Phosphate.

[SODIUM ORTHOPHOSPHATE.]

Preparation.—Sodium phosphate may be prepared by the process formerly official, as follows:

Take of Bone, calcined to whiteness and in fine powder, 120 oz. troy; Sulphuric Acid 72 oz. troy; Carbonate of Sodium, Water, each, a sufficient quantity. Mix the powder with the Sulphuric Acid in

an earthen vessel ; then add 8 pints of Water, and, having stirred the mixture thoroughly, digest for three days, occasionally adding a little Water to replace that which is lost by evaporation, and frequently stirring the mixture. At the expiration of that time, pour in 8 pints of boiling Water, and strain through muslin, gradually adding more boiling Water until the liquid passes nearly tasteless. Set by the strained liquor that the dregs may subside, and, having poured off the clear solution, boil it down to 8 pints. To the concentrated liquid, poured off from the newly formed dregs and heated in an iron vessel, add by degrees Carbonate of Sodium, previously dissolved in hot Water, until effervescence ceases, and the phosphoric acid is completely saturated ; then filter the liquid, and set it aside to crystallize. Having removed the crystals, add, if necessary, a small quantity of Carbonate of Sodium to the liquid, so as to render it slightly alkaline ; then alternately evaporate and crystallize, so long as crystals are produced. Lastly, keep the crystals in a well-stopped bottle.

The part of bones which is incombustible is obtained by burning them to whiteness, and consists of neutral calcium phosphate, called *bone-phosphate*, or *bone-ash*, associated with some calcium carbonate. When this is mixed with sulphuric acid, the calcium carbonate is entirely decomposed, giving rise to effervescence. The calcium phosphate undergoes partial decomposition ; the greater part of the lime, being liberated, precipitates as calcium sulphate, while the phosphoric acid combines with the undecomposed portion of the phosphate, and remains in solution as an acid calcium phosphate, holding dissolved a small portion of calcium sulphate.

In order to separate the acid phosphate from the precipitated mass of calcium sulphate, boiling water is added to the mixture, the whole is strained, and the sulphate washed as long as acid phosphate is removed, which is known by the water passing through in an acid state. The different liquids which have passed the strainer, consisting of the solution of acid calcium phosphate, are mixed and allowed to stand ; and by cooling a portion of calcium sulphate is deposited, which is got rid of by decantation. The bulk of the liquid is now reduced by evaporation, and, in consequence of the diminution of the water, a fresh portion of calcium sulphate is deposited, which is separated by subsidence and decantation as before. The acid calcium phosphate solution, being heated, is now saturated by means of a hot solution of sodium carbonate. The carbonic acid is liberated with effervescence, and the alkali, combining with the excess of acid of the acid phosphate, produces sodium phosphate ; while the acid calcium phosphate, by the loss of its excess of acid, becomes the neutral phosphate and precipitates.

The calcium phosphate is separated by filtration; and the filtered liquor, which is a solution of sodium phosphate, is evaporated so as to crystallize.

Sodii Phosphas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Large, colorless, monoclinic prisms. The crystals effloresce in the air, and gradually lose 5 molecules of their water of crystallization (25.1 per cent.). When heated to about 40° C. (104° F.), the salt fuses, yielding a clear liquid, and, on continued heating to near 100° C. (212° F.), it loses all its water of crystallization (60.3 per cent.). At a red heat, it is converted into sodium pyrophosphate.	Odorless; cooling, saline taste; slightly alkaline reaction.	At 15° C. (59° F.), 5.8 parts. Boiling, 1.5 parts.	Insoluble.

A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Calcium.	{ No residue should be left on dissolving the salt in water. No turbidity or coloration should be produced in the aqueous solution by the addition of a small quantity of ammonium sulphide T.S., or of an equal volume of hydrogen sulphide T.S. after the addition of a few drops of hydrochloric acid.
A 5-per-cent. aqueous solution of the salt yields a white precipitate with magnesia mixture.	Metals.	
With silver nitrate T.S. it yields a yellow precipitate, soluble in ammonia water and in nitric acid.	Limit of Arsenic.	{ If 1 Gm. of the powdered salt be shaken with 3 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), then a small piece of pure tin-foil added, and a gentle heat applied, no brown coloration should appear within fifteen minutes. If 0.5 Gm. of the salt be dissolved in 4 C.c. of water, and 1 C.c. of sodium bitartrate then added, the solution should remain perfectly clear.
If 0.5 C.c. of the aqueous solution be mixed with 1 C.c. of ammonium molybdate T.S., the mixture will at once assume a yellow color, and, after a few minutes, yield a yellow precipitate, the appearance of which is hastened by a gentle heat.	Limit of Potassium.	
	Carbonate.	{ No effervescence should occur on the addition of hydrochloric or nitric acid to a solution of the salt. On adding to 5 C.c. of the aqueous solution (1 in 20) 0.5 C.c. of silver nitrate T.S., a pure yellow precipitate will be formed, which should not become dark-colored by heating.
	Hypophosphite, etc.	
	Limit of Chloride.	{ And which, upon the addition of nitric acid, should yield a perfectly clear or, at most, only a slightly opalescent liquid. If to 5 C.c. of the aqueous solution, acidulated with hydrochloric acid, 0.5 C.c. of barium chloride T.S. be added, the solution should not be rendered more than very slightly opalescent.
	Limit of Sulphate.	

Uses.—Sodium phosphate is principally used as a cathartic, in doses of half an ounce to one ounce (15.5 to 31.1 Gm.).

SODII PYROPHOSPHAS. U.S. Sodium Pyrophosphate.

Preparation.—Sodium pyrophosphate, as its name indicates, is prepared by heating sodium phosphate in a suitable vessel to redness. When sodium phosphate is subjected to a temperature of 44° C. (111.2° F.), it melts in its water of crystallization; if the heat be increased to 100° C. (212° F.), all the water is dispelled, and but 40 per

cent. of the original weight remains; at 300° C. (572° F.) it is converted into the tetrabasic phosphate or pyrophosphate. By dissolving this residue in water, filtering, and crystallizing, the salt may be obtained.

Sodii Pyrophosphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, or a crystalline powder, permanent in cool air, slightly efflorescent in warm air. When heated to 100° C. (212° F.), the salt loses its water of crystallization (40.34 per cent.) without previous fusion. At a higher temperature it fuses, forming a transparent liquid, which, on cooling, solidifies to a crystalline mass.	Odorless; cooling, saline, and feebly alkaline taste; slightly alkaline reaction.	At 15° C. (59° F.), 12 parts. Boiling, 1.1 parts.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A fragment of the salt imparts to a non-luminous flame an intensely yellow color.</p> <p>A 5-per-cent. aqueous solution of the salt yields with magnesia mixture a white precipitate; with silver nitrate T.S. it yields a precipitate of a pure white color (distinction from <i>orthophosphate</i>). Uses.—This salt was made official solely because of its use in preparing ferric pyrophosphate.

SODII SALICYLAS. U. S. Sodium Salicylate.

Preparation.—Sodium salicylate is prepared by mixing one hundred parts of pure salicylic acid with sufficient distilled water to form a paste, and then with one hundred and four parts of pure crystallized carbonate of sodium (uneffloresced) in a glass or porcelain vessel; carbon dioxide will be evolved, and sodium salicylate will remain in solution.

The liquid may be strained through thoroughly-washed muslin if found necessary, and heated in a capsule until the carbon dioxide is expelled.

It should not be filtered through ordinary paper, on account of the impurities generally present; the slightest contact with iron will discolor

the product, and for this reason the commercial sodium carbonate is unfitted for use in making this salt.

If alkaline to litmus paper, enough salicylic acid must be added to be slightly in excess, and the solution should be evaporated at a low heat to dryness. If the acid is not in excess, the salt will not be white, but gray or lead-colored; and if heated too much, the odor of carbolic acid will be noticed.

Sodii Salicylas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A white, amorphous powder, permanent in cool air. When heated, the salt is decomposed, giving off inflammable vapors and an odor of phenol, and finally leaves a residue of sodium carbonate. To a non-luminous flame it imparts an intensely yellow color.	Odorless; sweetish, saline taste; feebly acid reaction.	At 15° C. (59° F.), 0.9 part.	At 15° C. (59° F.), 6 parts.	Soluble in glycerin.
		Boiling, Very soluble.	Boiling, Very soluble.	
TESTS FOR IDENTITY.		IMPURITIES. TESTS FOR IMPURITIES.		
Ferric chloride T.S., added to an excess of a concentrated solution of the salt, produces a red precipitate; but when added to a very dilute solution (1 in 100), it produces a deep violet-blue color. If copper sulphate T.S. be added to the aqueous solution (1 in 20), a green color will be produced. On adding to a small portion of the salt, in a test-tube, about 1 C.c. of concentrated sulphuric acid, and then, cautiously, about 1 C.c. of methylic alcohol in drops, on heating the mixture to boiling, the odor of methyl salicylate will be evolved. Hydrochloric or sulphuric acid produces in a concentrated aqueous solution of the salt a voluminous, white precipitate, which, after being separated by filtration and washed, should conform to the reaction and tests given under Acidum Salicylicum.	Carbonate.	{ The aqueous solution should be colorless, even when concentrated, and should not effervesce on the addition of acids. When the solution (1 in 20) is mixed with a small quantity of ammonium sulphide T.S., or with an equal volume of hydrogen sulphide T.S., no coloration or turbidity should appear. If 1 Gm. of the salt be dissolved in a mixture of 50 C.c. of alcohol and 25 C.c. of water, then acidulated with nitric acid and filtered, a portion of the filtrate should not be rendered turbid by the addition of a few drops of barium chloride T.S. Another portion of the filtrate should remain clear on the addition of a few drops of silver nitrate T.S. If 1 part of the salt be agitated with 15 parts of cold, concentrated sulphuric acid, no brown color should be produced within fifteen minutes.		
	Metallic substances.			
	Sulphate.			
	Chloride.			
	Readily Carbonizable Organic Impurities.			

Uses.—This salt is administered in rheumatic and neuralgic affections, in doses of twenty to thirty grains (1.3 to 1.9 Gm.).

SODII SULPHAS. U. S. Sodium Sulphate.

[GLAUBER'S SALT.]

Preparation.—This salt is largely obtained as a by-product in the manufacture of soda-ash, hydrochloric and nitric acids, ammonium chloride, etc.

Sodii Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Large, colorless, transparent, monoclinic prisms, or granular crystals, rapidly efflorescing on exposure to air, and ultimately falling into a white powder. When heated to 33° C. (91.4° F.), the salt melts, and, on further heating, gradually loses all its water (55.9 per cent.). At a red heat the anhydrous salt melts without decomposition.	Odorless; saline and somewhat bitter taste; neutral reaction.	At 15° C. (59° F.), 2.8 parts. The solubility in water increases up to 34° C. (93.2° F.), when its maximum is attained, 1 part of the salt then dissolving in somewhat less than 0.25 part of water; from thence it gradually decreases with rising temperature, until 1 part requires 0.47 part of boiling water for solution.	Insoluble.	Soluble in glycerin.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
A fragment of the salt imparts to a non-luminous flame an intensely yellow color. The aqueous solution yields, with barium chloride T.S., a white precipitate insoluble in nitric acid.	Magnesium.	If to 5 C.c. of the aqueous solution (1 in 20) 1 C.c. of sodium phosphate T.S. and 0.5 C.c. of ammonia water be added, no turbidity or precipitate should be produced, even after agitation.		
	Carbonate.	The solution should not effervesce on the addition of an acid.		
	Arsenic and Metallic Impurities.	It should not be colored or rendered turbid by the addition of ammonium sulphide T.S.; or of an equal volume of hydrogen sulphide T.S., after being acidulated with hydrochloric acid.		
	Chloride.	After acidulation with nitric acid, the aqueous solution should remain clear, or at most be rendered only very slightly opalescent, on the addition of silver nitrate T.S.		

Care must be employed, in using the formulas requiring this salt, to see that it is not effloresced, as such a salt may have lost half of its water of crystallization, and be therefore one-third stronger than it should be.

Uses.—This well-known sulphate is largely used in veterinary practice. As a purgative it is not so well suited for administration to human beings, the magnesium sulphate being preferred. It may be given to adults in doses of half an ounce to one ounce (15.5 to 31.1 Gm.).

SODII SULPHIS. U. S. Sodium Sulphite.

Preparation.—A very satisfactory mode of making this sulphite is by dissolving a convenient weight of sodium carbonate in a small quantity of water, then passing sulphurous acid gas through the solution until it is completely saturated and acid sodium sulphite is formed. The addition of an equal weight of sodium carbonate forms a solution of the neutral sulphite, which is to be evaporated and crystallized.

The sodium sulphite which is most frequently used now is the *granulated sodium sulphite*: this is prepared by evaporating a solution of the sulphite to dryness in the usual manner. As thus prepared, it is much more stable than the crystallized salt: it should be remembered, however, that it is of nearly twice the strength of the latter, and the quantity used should be proportionally lessened. Theoretically, the quantity of water present in the crystals is exactly half their weight.

Sodii Sulphis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, efflorescent in dry air, and is slowly oxidized to sulphate. When gently heated, the salt softens somewhat, but does not fuse. Above 100° C. (212° F.), the crystals lose all their water (50 per cent.), without fusing or changing their shape. At a red heat the salt fuses to a reddish-yellow mass of sodium sulphate and sodium sulphide. A fragment of the salt imparts to a non-luminous flame an intensely yellow color.	Odorless; cooling, saline and sulphurous taste; neutral or feebly alkaline reaction.	At 15° C. (59° F.), 4 parts. Boiling, 0.9 part.	Sparingly soluble.

TEST FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
Upon the addition of hydrochloric acid to the salt or its solution, sulphur dioxide gas is liberated, which is recognized by its odor and by its blackening a strip of paper moistened with mercurous nitrate T.S. and held in the escaping gas; the solution remains clear, no sulphur being separated (distinction from <i>hyposulphite</i>). If 0.63 Gm. of the salt be dissolved in 25 C.c. of water recently boiled to expel air, and a little starch T.S. be added, at least 48 C.c. of decinormal iodine V.S. should be required to produce a permanent blue tint (each C.c. corresponding to 2 per cent. of the pure salt).	Metallic Impurities. Limit of Sulphate. Limit of Chloride.	The aqueous solution (1 in 20) should not be colored or rendered turbid by the addition of an equal volume of hydrogen sulphide T.S., either before or after the addition of ammonia water in slight excess. If a solution of 2.5 Gm. of the salt in 11 C.c. of diluted hydrochloric acid be heated sufficiently to expel the sulphur dioxide, then 0.15 C.c. of barium chloride T.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unaffected by the further addition of barium chloride T.S. If 1.2 Gm. of Sodium Sulphite be dissolved in 10 C.c. of diluted nitric acid, the solution heated to expel the gases, then 0.4 C.c. of decinormal silver nitrate V.S. added, and the precipitate, if any, removed by filtration, the clear filtrate should remain unchanged by the further addition of silver nitrate V.S.

Uses.—Sodium sulphite is one of the most useful antiferments. It is given in doses of ten to thirty grains (0.6 to 1.9 Gm.).

SODII SULPHOCARBOLAS. U.S. Sodium Sulphocarbolate.

[SODIUM PARAPHENOLSULPHONATE.]

Preparation.—Sodium sulphocarbolate may be made by mixing equal parts of pure carboic acid and strong sulphuric acid, whereby *sulphocarboic acid*, $\text{C}_6\text{H}_4\text{HSO}_3$, is produced. The mixed liquids must be subjected to a temperature of 55° C. (131° F.) for several days, and then twenty parts of water should be added. Two parts of barium

carbonate are mixed with the liquid, a little at a time, carefully graduating the quantity until effervescence ceases. The liquid is now allowed to stand, to permit the precipitation of the barium sulphate, and of any carbonate which may be present, and the liquor filtered. The solution of *barium sulphocarbonate* is decomposed by adding sodium carbonate until precipitation ceases, when the liquid is filtered from the barium carbonate, and the sodium sulphocarbonate may be obtained by evaporating the filtrate and crystallizing.

Sodii Sulphocarbonas. U.S.		Solubility.	
		Water.	Alcohol.
Colorless, transparent, rhombic prisms, slightly efflorescent in dry air. When heated a little above 100° C. (212° F.), the salt loses all its water (15.5 per cent.) and becomes white. At a higher temperature it chars, emits inflammable vapors having the odor of phenol, and finally leaves a residue of sodium sulphate amounting to 30.6 per cent. of the original weight.		At 15° C. (59° F.), 4.8 parts.	At 15° C. (59° F.), 132 parts.
		Boiling, 0.7 part.	Boiling, 10 parts.
Tests for Identity.		Impurities.	
A fragment of the salt imparts an intensely yellow color to a non-luminous flame. A dilute solution (1 in 100) of the salt is rendered pale violet by ferric chloride T.S., but remains clear; barium chloride T.S. leaves the solution clear; but if a portion of the salt be ignited, and the residue dissolved in water, the same reagent will produce in the solution a copious white precipitate.		Tests for Impurities.	
		Metallic Impurities.	In the aqueous solution (1 in 20) neither hydrogen sulphide T.S. nor ammonium sulphide T.S. should produce any turbidity or coloration.
		Sulphate.	Nor should more than a faint opalescence be produced by barium chloride T.S.
		Chloride.	Or by silver nitrate T.S.

Uses.—This salt is used as an antiferment, in doses of ten to twenty grains (0.6 to 1.3 Gm.). It is also used in injections.

QUESTIONS ON CHAPTER XXXIX.

THE SODIUM SALTS.

Why are sodium salts more frequently used than potassium salts?

Describe sodium.

How may sodium be recognized in its salts?

Table of preparations of sodium.

Soda—Give the formula in symbols and molecular weight.

How is it obtained?

Give rationale of process and chemical reaction; odor, taste, and tests for identity.

How may the following impurities be detected?—viz.: Organic matter; chloride; sulphate; carbonate; silica or carbonate.

- Why is caustic soda preferred to potassa?
 How is it used pharmaceutically?
 Solution of soda—Give the Latin official name. How is it made?
 How much hydrate of sodium does it contain?
 What is the alternative process for making it?
 Of what strength should the soda used in this process be; and if not of the proper strength, how can it be used?
 How is sodium hydrate obtained? Give rationale of process; chemical reaction; description and specific gravity; odor, taste, and tests for identity.
 How may the following impurities be detected?—viz.: Carbonate; alkaline earths; sulphate; chloride; foreign impurities.
 What is the dose?
 Sodium acetate—Give formula in symbols and molecular weight.
 How is it obtained? How much water does it contain?
 Give rationale of process and chemical reaction.
 Describe the odor and taste. Give the tests for identity.
 How may the following impurities be detected?—viz.: Chloride; sulphate; silica; metals; alkaline earths; carbonate; organic impurities.
 What is the dose?
 Sodium arsenate—Give formula in symbols and molecular weight.
 Give the process for making it which was formerly official. Give rationale of process.
 How much water does it contain? Give chemical reaction. How may impurity of arsenite be detected?
 What is the dose?
 Sodium benzoate—Give formula in symbols and molecular weight.
 How is it made? Give rationale of process and chemical reaction.
 Sodium bicarbonate—Give formula in symbols and molecular weight.
 How is this prepared?
 What is the object of washing the commercial bicarbonate?
 How much of its weight does it lose on being heated?
 What percentage of pure sodium bicarbonate is required in the official preparation? Give rationale of process.
 What chemical reaction takes place during the process?
 How may the following impurities be detected?—viz.: Chloride; sulphate; ammonium salts; more than about 8 per cent. of carbonate.
 What is the dose?
 How is commercial sodium bicarbonate prepared?
 How much water of crystallization does it contain?
 How much water of crystallization does sodium carbonate contain?
 Give rationale of process.
 What is Solvay's process, or the ammonia-soda process?
 Give rationale of process.
 What percentage of pure sodium bicarbonate is it required to contain?
 How may the following impurities be detected?—viz.: Chloride; sulphate; carbonate.
 What is the dose?
 Sodium bisulphite—Give formula in symbols and molecular weight.
 How is it prepared?
 Give rationale of process.
 What change takes place on exposure to the air?
 For what purpose is it used in the arts?
 Describe the chemical reaction which takes place during the process.
 How may an impurity of sulphate be detected?
 What is the dose?
 Sodium borate—Give formula in symbols and molecular weight.
 Where does the commercial article come from, and how is it obtained?
 What other names has it?
 Where is it found native?
 How is it made from boric acid?
 How much water of crystallization does it contain?
 Give odor, taste, and chemical reaction.
 What are the tests for identity?
 How may the following impurities be detected?—viz.: Carbonate; alkaline earths; metals; sulphate; chloride.

What are its medicinal uses ?

For what is it used in pharmacy ?

Sodium bromide—Give formula in symbols and molecular weight.

How is this generally made ? Give the rationale of the process. Describe the chemical reaction.

How else may it be made ?

How may the following impurities be detected ?—viz. : Bromate ; iodide ; sulphate ; more than 8 per cent. of chloride.

What is the dose ?

Sodium carbonate—Give the formula in symbols and molecular weight.

What is Leblanc's process for its manufacture ?

Give the rationale of the process.

What is soda-waste, and for what is it used ?

How much sodium carbonate does the soda-ash thus prepared contain ?

How may sodium carbonate be obtained from the bicarbonate, and in what process is it so obtained ?

What is the process known as the cryolite process ?

What is cryolite, and how much sodium is contained in 100 parts of it ? What is its formula in symbols ?

How is sodium carbonate obtained from cryolite ?

Give the rationale of the process.

What percentage of water does sodium carbonate contain ? Describe odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected ?—viz. : Chloride ; sulphate ; metals ; alumina.

What is its use in pharmacy ?

Why should the effloresced salt not be used ?

What is the dose of it ? Why is it rarely used internally ?

Dried sodium carbonate—Give the Latin official name.

How is it prepared ?

What is the object of driving off the water from the carbonate ?

What is the dose ?

Sodium chlorate—Give formula in symbols and molecular weight.

What is Wittstein's process for preparing this salt ?

Give the rationale of the process.

What special cautionary direction is given with this in the U. S. P., and for what reason ? Describe the odor, taste, and chemical reaction.

How may the following impurities be detected ?—viz. : Potassium ; sulphate ; calcium ; chloride.

What is the dose ?

What advantage has it over potassium chlorate ?

Sodium chloride—Give formula in symbols and molecular weight.

Where does it come from ?

Describe the odor, taste, and chemical reaction.

How may the following impurities be detected ?—viz. : Alkaline earths ; sulphate ; metals ; iodide or bromide.

What is the dose ?

Sodium hypophosphite—Give formula in symbols and molecular weight.

How is the salt prepared ?

What danger attends the use of too great heat ?

What gases are evolved by heat ?

What acid is present in this salt, and what is its composition ?

Why should it not be prescribed with combinations of mercury or of silver ? Describe the odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected ?—viz. : Carbonate ; calcium ; potassium ; sulphate ; phosphate.

What are its uses in medicine and in pharmacy ?

Sodium hyposulphite—Give formula in symbols and molecular weight.

What is this salt more correctly called ? Give the rationale of the process.

How is it made ? Describe the odor, taste, and chemical reaction.

How may the following impurities be detected ?—viz. : Sulphate ; carbonate.

What is the dose ?

Sodium iodide—Give formula in symbols and molecular weight.

How may it be prepared ? Give rationale of process. Describe the odor, taste, and chemical reaction. What are the tests for identity ?

How may the following impurities be detected?—viz.: Iodate; more than about 0.5 per cent. of chloride or bromide; sulphate.

What is the dose?

Sodium nitrate—Give formula in symbols and molecular weight.

What are the common names of this salt, and where is it found? Describe the odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected?—viz.: Metals; alkaline earths; potassium; sulphate; chloride; iodide.

Sodium nitrite—Give formula in symbols and molecular weight.

How is it prepared?

What are its uses?

Sodium phosphate—Give formula in symbols and molecular weight.

What is the process for making it which was formerly official? Describe rationale of process.

Describe the odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected?—viz.: Carbonate; metals; sulphate; chloride.

What is the dose?

What is bone-phosphate or bone-ash?

Sodium pyrophosphate—Give formula in symbols and molecular weight.

How is it prepared?

How much water of crystallization does sodium phosphate contain?

Describe the odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected?—viz.: Carbonate; metals; sulphate; chloride.

For what is it used?

Sodium salicylate—Give formula in symbols and molecular weight.

How is it made?

What precautions must be used in evaporating the solution in order to obtain the salt white and free from the odor of carbolic acid?

Describe the odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected?—viz.: Carbonate; foreign organic matter; sulphate; chloride.

What is the dose?

Sodium santoninate—Give formula in symbols and molecular weight.

What is its dose? What are its supposed advantages over santonin?

Sodium sulphate—Give formula in symbols and molecular weight.

How is this salt obtained?

What is the common or popular name? Describe odor, taste, and chemical reaction. Give the tests for identity.

How may the following impurities be detected?—viz.: Carbonate; metals; chloride; ammonia.

How much water of crystallization does it contain?

What is the dose?

Sodium sulphite—Give formula in symbols and molecular weight.

How may this salt be prepared? Describe rationale of process.

What difference is there between the crystallized salt and the granulated salt? Describe odor, taste, and chemical reaction. Give the tests for identity.

How may impurity of sulphate be detected?

What is the dose?

Sodium sulphocarbonate—Give formula in symbols and molecular weight.

How may this salt be made? Describe rationale of process. Describe odor, taste, and chemical reaction. Give the tests for identity.

How may impurity of sulphate be detected?

What is the dose?

CHAPTER XL.

THE LITHIUM SALTS.

THE lithium salts resemble those of potassium and sodium. The metal lithium is comparatively rare, for, although widely distributed in nature, it occurs in such small quantities that the necessary labor to extract it makes it expensive: it is found in *triphyline*, in *spodumene*, and in many mineral waters.

Lithium is a metal resembling potassium and sodium, although much less prone to oxidation: it is soft, *and is the lightest of all known metals*, having the specific gravity of 0.5891. Heated in the air, lithium ignites at a temperature above its fusing point, burning with a bright white light; when thrown on water, it oxidizes, but does not fuse like sodium. Chemically, lithium is a monad, like sodium and potassium.

Tests for Lithium Salts.

1. A colorless flame is colored a vivid red by volatile salts of lithium.
2. Concentrated solutions of lithium salts yield a white precipitate with ammonium carbonate; no precipitate is produced in dilute solution or if ammonia salts are present.
3. Sodium phosphate produces a white precipitate in alkaline or neutral solution, which is soluble in acids and in solutions of ammonia salts.

Official Preparations of Lithium.

Official Name.	Preparation.
Inorganic Radicals.	
Lithii Bromidum	By decomposing ferrous bromide with lithium carbonate.
Lithii Carbonas	By precipitating lithium sulphate with ammonium carbonate.
Organic Radicals.	
Lithii Benzoas	By treating lithium carbonate with benzoic acid.
Lithii Citras	By treating lithium carbonate with citric acid.
Lithii Citras Effervescens .	By incorporating lithium carbonate with sodium carbonate, citric acid, and sugar.
Lithii Salicylas	By treating lithium carbonate with salicylic acid.

Unofficial Preparations of Lithium.

Lithii Borocitras.	Dissolve 20 Gm. citric acid, 4 Gm. lithium carbonate, and 6 Gm. boric acid in sufficient boiling water, evaporate carefully to dryness, and reduce to a powder.
Lithium Borocitrate.	
Lithii Chloridum, LiCl.	Dissolve lithium carbonate in hydrochloric acid, and concentrate to crystallize.
Lithium Chloride.	
Lithii Diborocitras.	Dissolve 20 Gm. citric acid, 7 Gm. lithium carbonate, and 12 Gm. boric acid in sufficient boiling water, evaporate carefully to dryness, and reduce to a powder.
Lithium Diborocitrate.	
Lithii Iodidum, LiI.	Digest a solution of calcium iodide with lithium carbonate in slight excess, filter, and evaporate to dryness.
Lithium Iodide.	
Lithii Nitras, LiNO ₃ .	Dissolve lithium carbonate in nitric acid, filter, and concentrate to crystallize.
Lithium Nitrate.	
Lithii Phosphas, Li ₃ PO ₄ .	Add a solution of lithium carbonate to a solution of sodium phosphate with caustic soda; a crystalline powder will be precipitated.
Lithium Phosphate.	
Lithii Sulphas, Li ₂ SO ₄ .H ₂ O.	Dissolve lithium carbonate in sulphuric acid, filter, and concentrate to crystallize.
Lithium Sulphate.	

LITHII BENZOAS. U. S. Lithium Benzoate.

Preparation.—This may be made by Shuttleworth's process, which is as follows:

One ounce (av.) of lithium carbonate is put in a capsule with nine fluidounces of water, the mixture is heated, and three and a quarter ounces (av.) of benzoic acid in small portions added, until the carbonate is all decomposed and effervescence ceases: the solution is filtered and evaporated to dryness, or crystallized if desired. The yield is three and a half ounces. The advantage of this process is a saving in time and labor in evaporating.

Lithii Benzoas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A light, white powder, or small, shining, crystalline scales, permanent in the air. When heated, the salt fuses; at a higher temperature it chars, emits inflammable vapors having a benzoïn-like odor, and finally leaves a residue of lithium carbonate mixed with carbon, which imparts a crimson color to a non-luminous flame, and its aqueous solution has an alkaline reaction upon litmus paper.	Odorless, or having a faintly benzoïn-like odor; cooling and sweetish taste; faintly acid reaction.	At 15° C. (59° F.), 4 parts.	Cold, 12 parts.
		Boiling, 2.5 parts.	Boiling, 10 parts.
		The presence of sodium benzoate increases the solubility in water, and lessens that in alcohol.	

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If 2 C.c. of ferric chloride T.S. be mixed with a small drop of ammonia water, and added to 2 C.c. of an aqueous solution of the salt, a voluminous brownish-pink precipitate of basic ferric benzoate will result.</p> <p>The aqueous solution (1 in 20) of the salt should remain unaffected by sodium cobaltic nitrite T.S. (limit of potassium), nor should silver nitrate T.S. or barium nitrate T.S. produce in it more than a very slight turbidity (limit of <i>chloride</i> and <i>sulphate</i>).</p> <p>If a concentrated solution of the salt be mixed with hydrochloric acid, a white precipitate of benzoic acid will be formed, which, after being separated from the liquid, and thoroughly washed and dried, should respond to the tests of purity given under <i>Acidum Benzoicum</i>.</p> <p>If the filtrate from this precipitate be evaporated to dryness and ignited, 1 part of the residue should be soluble in 5 parts of absolute alcohol. If to this alcoholic solution an equal volume of ether be added, no precipitate or turbidity should appear (limit of <i>other alkalies</i>).</p> <p>If 1 Gm. of dry Lithium Benzoate be thoroughly ignited in a porcelain crucible, so as to burn off most of the carbonaceous matter, and the residue be mixed with 20 C.c. of water, it should require, for complete neutralization, not less than 7.3 C.c. of normal sulphuric acid (corresponding to not less than 99.6 per cent. of the pure salt), methyl-orange being used as indicator.</p>	<p>Chloride.</p> <p>Sulphate.</p> <p>Arsenic, Lead, Iron, Aluminium, etc.</p> <p>Calcium.</p> <p>Potassium.</p>	<p>If 1 C.c. of diluted nitric acid be added to 0.2 Gm. of Lithium Benzoate, dissolved in 2 C.c. of water, and the precipitated benzoic acid be removed by filtration, the clear filtrate should not be rendered turbid on the addition of silver nitrate T.S.,</p> <p>Or of barium nitrate T.S.</p> <p>The aqueous solution (1 in 20) of the salt should remain unaffected by hydrogen sulphide T.S. or ammonium sulphide T.S.,</p> <p>Or by ammonium oxalate T.S.,</p> <p>Or by sodium cobaltic nitrite T.S.</p>

Uses.—Lithium benzoate is used as a remedy in gout and rheumatism, in doses of fifteen to twenty grains (0.9 to 1.3 Gm.).

LITHII BROMIDUM. U. S. Lithium Bromide.

LiBr; 86.77.

Preparation.—There are several methods of making this salt: 1. By dissolving lithium carbonate in hydrobromic acid. 2. By mixing solutions of lithium sulphate and potassium bromide. 3. By mixing lithium, carbonate, bromine, and water together, and passing hydrogen sulphide gas through the mixture. 4. By placing 300 grains of iron and 2 fluidounces of water in a flask, and adding gradually 1 oz. av. of bromine, shaking with the application of moderate heat until the mixture has acquired a green color and lost the odor of bromine: the solution of ferrous bromide is then filtered, heated, and 200 grains of lithium carbonate are added. The solution is filtered, and evaporated until the salt granulates.

Lithii Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A white, granular salt, very deliquescent. At a low red heat the salt fuses, and at a higher heat it is slowly volatilized. A fragment of the salt imparts a crimson color to a non-luminous flame.	Odorless; sharp, somewhat bitter taste; neutral reaction.	At 15° C. (59° F.), 0.6 part. Boiling, 0.3 part.	Very soluble.	Soluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
If a few drops of chloroform be added to 5 C.c. of the solution (1 in 20), then 1 C.c. of chlorine water, and the mixture shaken, the liberated bromine will dissolve in the chloroform, communicating to it a yellow or yellowish-brown color.	Arsenic, Lead, Copper, etc. Iron, Aluminium. Sulphate. Iodide.	The aqueous solution (1 in 20) should not be affected by hydrogen sulphide T.S. either before or after acidulation with a drop of hydrochloric acid, Nor by ammonium sulphide T.S. In the aqueous solution no turbidity should be produced by the addition of barium chloride T.S. If a few drops of starch T.S. be added to 5 C.c. of the aqueous solution, and then a drop or two of chlorine water, no blue color should appear.
If 0.5 C.c. of sodium cobaltic nitrite T.S. be added to 5 C.c. of the aqueous solution, no precipitate or turbidity should occur within 10 minutes (limit of potassium).		
One part of the salt should dissolve, without residue, in 5 parts of absolute alcohol, and the addition of an equal volume of ether should produce no precipitate in this solution (limit of other alkalies).		
If 0.3 Gm. of dry Lithium Bromide be dissolved in 10 C.c. of water and 2 drops of potassium chromate T.S. be added, it should require 35.3 C.c. of decinormal silver nitrate V.S. to produce a permanent red color of silver chromate (corresponding to at least 98 per cent. of the pure salt).		

Uses.—Lithium bromide is probably the most efficient of all the bromides as a hypnotic. The dose is fifteen to thirty grains (0.9 to 1.9 Gm.).

LITHII CARBONAS. U.S. Lithium Carbonate.

Preparation.—Lithium carbonate may be prepared from lepidolite, one of the minerals in which it is found, in the following manner: 10 parts of finely powdered lepidolite, 10 parts of barium carbonate, 5 parts of barium sulphate, and 3 parts of potassium sulphate are fused at a very high temperature in a wind furnace. The heavy silicate and barium sulphate sink to the bottom, and a layer of potassium and lithium sulphates is found at the top of the fused mass. These can be extracted by simple lixiviation, and then the carbonate prepared by double decomposition with ammonium carbonate.

Lithii Carbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A light, white powder, permanent in the air. At a low red heat the salt fuses; at a higher temperature it loses some of its carbon dioxide, and is partially converted into lithium oxide. It imparts a crimson color to a non-luminous flame.	Odorless; alkaline taste; alkaline reaction.	At 15° C. (59° F.), 80 parts. Boiling, 140 parts. Much more soluble in water saturated with carbon dioxide.	Insoluble.	Soluble in diluted acids, with copious effervescence.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
If 1 Gm. of Lithium Carbonate be dissolved in 40 C.c. of diluted acetic acid, no insoluble residue should remain.	Limit of Potassium. Arsenic, Lead, etc. Iron, Aluminum, etc. Calcium. Chloride. Sulphate.	A portion of its solution in diluted acetic acid solution should not be affected by sodium cobaltic nitrite T.S., Nor by hydrogen sulphide T.S., Nor by ammonium sulphide T.S., Nor by ammonium oxalate T.S., Nor by silver nitrate T.S., Nor by barium chloride T.S.
If 0.5 Gm. of Lithium Carbonate be dissolved in 2 C.c. of hydrochloric acid, and the clear solution be evaporated to dryness, the dry residue should completely dissolve in 3 C.c. of absolute alcohol, and an addition of 3 C.c. of ether should not render the solution turbid (limit of other alkalis).		
If 0.5 Gm. of the dry salt be mixed with 20 C.c. of water, it should require, for complete neutralization, not less than 13.4 C.c. of normal sulphuric acid (corresponding to at least 98.98 per cent. of the pure salt), methyl-orange being used as indicator.		

Uses.—This salt is the source of the lithium salts, and it is prescribed in gout, in doses of five to fifteen grains (0.3 to 0.9 Gm.).

LITHII CITRAS. U.S. Lithium Citrate.

Preparation.—The process formerly official may be usefully employed in making this salt:

Take of Carbonate of Lithium 100 grains; Citric Acid, in crystals, 200 grains; Distilled Water 2 fl. oz. Dissolve the Citric Acid in the

water gently heated, and to the solution gradually add the Carbonate of Lithium until perfectly dissolved, heating the solution so long as effervescence is produced. Evaporate, by means of a steam- or sand-bath, to a viscid consistence, dry the residue in an oven, at a temperature of about 240° F., then rapidly pulverize it, and preserve the powder in a well-stopped bottle.

Lithium citrate should be kept in well-stopped bottles.

Lithii Citras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A white powder, deliquescent on exposure to air. When exposed to a red heat, the salt chars, emits inflammable vapors of a pungent odor, and finally leaves a black residue of lithium carbonate mixed with carbon, which imparts a crimson color to a non-luminous flame.	Odorless; cooling, faintly alkaline taste; neutral reaction.	At 15° C. (59° F.), 2 parts. Boiling, 0.5 part.	Slightly soluble.	Almost insoluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If the aqueous solution (1 in 20) of the salt be boiled with an equal volume of calcium chloride T.S., it deposits a white precipitate.	Arsenic, Lead, etc.	Separate portions of the solution, slightly acidulated with acetic acid, should not be affected by hydrogen sulphide T.S.,
If the residue obtained by calcining the salt at a red heat be dissolved in a slight excess of diluted hydrochloric acid, and the filtrate evaporated to dryness, a portion of the residue, treated with 5 parts of absolute alcohol, should completely dissolve; and the addition of an equal volume of ether should not render the solution turbid (limit of other alkalies).	Iron, Aluminium, etc.	Nor by ammonium sulphide T.S.,
If 1 Gm. of dry Lithium Citrate be thoroughly ignited in a porcelain crucible, so as to burn off most of the carbonaceous matter, and the residue be mixed with 20 C.c. of water, it should require for complete neutralization not less than 14.2 C.c. of normal sulphuric acid (corresponding to at least 99.2 per cent. of the pure salt), methyl-orange being used as indicator.	Calcium.	Nor by ammonium oxalate T.S.,
	Limit of Potassium.	Nor by sodium cobaltio nitrite T.S.
	Sulphate.	Not more than a slight turbidity should appear with barium nitrate T.S.,
	Chloride.	Nor with silver nitrate T.S.

Uses.—Lithium citrate is used for the same purpose as lithium carbonate: it is more soluble than the latter. The dose is from fifteen to twenty grains (0.9 to 1.3 Gm.).

LITHII CITRAS EFFERVESCENS. U.S. Effervescent Lithium Citrate.

	Metric.	Old form.
Lithium Carbonate	70 Gm.	490 grains.
Sodium Bicarbonate	280 Gm.	4 oz. av. 210 gr.
Citric Acid	370 Gm.	5 oz. av. 402 gr.
Sugar, in fine powder, a sufficient quantity,		
To make	1000 Gm.	16 oz. av.

Triturate the Citric Acid with about 200 Gm. [old form 3 oz. av. 87 gr.] of Sugar, and dry the mixture thoroughly. Then incorporate with it, by trituration, the Lithium Carbonate and Sodium Bicarbonate, and enough Sugar to make the product weigh 1000 Gm. [old form 16 oz. av.]. Keep the powder in well-stoppered bottles.

Uses.—This salt forms a pleasant mode of administering a lithium salt; the dose is one to two drachms (3.9 to 7.8 Gm.).

LITHII SALICYLAS. U. S. Lithium Salicylate.

Preparation.—This salt may be prepared by adding 60 grains of lithium carbonate to 1 fluidounce of distilled water and heating the mixture to boiling, then adding 220 grains of salicylic acid and continuing the heat until effervescence ceases, filtering, and evaporating.

This salt should be kept in well-stoppered bottles.

Lithii Salicylas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white or grayish-white powder, deliquescent on exposure to air. When heated, the salt is decomposed, emitting the odor of phenol, and finally leaving a black residue of lithium carbonate and carbon, and imparting a crimson color to a non-luminous flame.	Odorless; sweetish taste; faintly acid reaction.	Very soluble.	Very soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If copper sulphate T.S. be added to an aqueous solution (1 in 20) of the salt, the mixture should have a bright green color.</p> <p>If a small quantity of ferric chloride T.S. be added to an excess of a concentrated, aqueous solution (1 in 4) of Lithium Salicylate, a deep red color will be produced, which, after the liquid is largely diluted and mixed with more ferric chloride T.S., will change to a deep bluish-violet tint.</p> <p>Upon adding to 1 Gm. of the salt, in a test-tube, about 1 C.c. of concentrated sulphuric acid, then, cautiously, in drops, about 1 C.c. of methyl alcohol, and heating the mixture to boiling, the odor of oil of gaultheria will be evolved.</p> <p>Hydrochloric or sulphuric acid produces in the aqueous solution a voluminous precipitate of salicylic acid, which, when separated and washed, should conform to the reaction and tests given under <i>Acidum Salicylicum</i>.</p> <p>If another portion of the residue, left after ignition, be dissolved in diluted hydrochloric acid, and the filtrate evaporated to dryness, a portion of the residue, when treated with 5 parts of absolute alcohol, should completely dissolve, and the addition of an equal volume of ether should not render the solution turbid (limit of <i>other alkalies</i>).</p>	<p>Iron and Organic Coloring Matters.</p> <p>Carbonate.</p> <p>Readily Carbonizable Organic Impurities.</p> <p>Sulphate.</p> <p>Limit of Chloride.</p> <p>Arsenic, Lead, etc.</p> <p>Aluminum, etc.</p>	<p>The aqueous solution should be colorless,</p> <p>And should not effervesce on the addition of diluted acids.</p> <p>If 1 part of the salt be agitated with 15 parts of sulphuric acid, no color should be imparted to the acid within 15 minutes.</p> <p>If a portion of the residue, left after ignition, be dissolved in diluted acetic acid, separate portions of the filtrate should not be rendered turbid on addition of a few drops of barium chloride T.S.,</p> <p>Nor more than slightly turbid by silver nitrate T.S.</p> <p>Other portions of the same filtrate should not be affected by hydrogen sulphide T.S.,</p> <p>Nor by ammonium sulphide T.S.,</p>

TESTS.—Continued.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If 2 Gm. of dry Lithium Salicylate be thoroughly ignited in a porcelain crucible, so as to burn off most of the carbonaceous matter, and the residue be mixed with 20 C.c. of water, it should require, for complete neutralization, not less than 13.8 C.c. of normal sulphuric acid (corresponding to at least 99.13 per cent. of the pure salt), methyl-orange being used as indicator.</p>	<p>Calcium. Limit of Potassium.</p>	<p>{ Nor by ammonium oxalate T.S., Nor by sodium cobaltic nitrite T.S.</p>

Uses.—This salicylate is used, like sodium salicylate, for rheumatism and gout: it is given in doses of twenty to forty grains (1.3 to 2.6 Gm.).

QUESTIONS ON CHAPTER XL.

THE LITHIUM SALTS.

What salts do the lithium salts resemble? How is lithium obtained?

What is its specific gravity? What is its chemical valence?

What are the tests for lithium salts?

Benzoate of lithium—Give formula in symbols and molecular weight.

How may it be made? Describe rationale of process. Give tests for identity. Describe odor, taste, chemical reaction, and solubility.

How may the following impurities be detected?—viz.: Salts of alkalies; salts of alkaline earths; metals. What is the dose?

Bromide of lithium—Give formula in symbols and molecular weight.

In what various ways may this salt be made? Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Salts of alkalies; salts of alkaline earths; metals. What is the dose?

Carbonate of lithium—Give formula in symbols and molecular weight. How may it be prepared? Describe odor, taste, and chemical reaction. What is the dose?

Citrate of lithium—Give formula in symbols and molecular weight.

What is the process for making it which was formerly officinal?

Give rationale of process. Describe odor, taste, chemical reaction, and solubility.

What is the official Latin name of effervescent lithium citrate?

Give its formula and mode of preparation.

Salicylate of lithium—Give formula in symbols and molecular weight.

How may it be prepared? Describe rationale of process. Describe odor, taste, chemical reaction, and solubility. Give the tests for identity.

How may the following impurities be detected?—viz.: Carbonate; foreign organic matters; salts of alkalies. What is the dose?

CHAPTER XLI.

AMMONIUM.

THE ammonium salts resemble those of the alkali metals so closely in their physical and chemical properties that they are appropriately considered in this place.

The metal ammonium has not yet been isolated in the free state, so that its appearance cannot be described. An *ammonium amalgam* is known, however, made by dissolving potassium in mercury and adding a strong solution of ammonium chloride to it. It is a spongy, metallic substance, which easily decomposes into ammonia, mercury, and hydrogen.

Tests for Ammonium Salts.

1. At high temperatures ammonium compounds are volatilized.
2. When heated with sodium, potassium, or calcium hydrate, the odor of ammonia is evolved: the latter restores the color of reddened litmus paper, and darkens the blue color of paper moistened with solution of copper sulphate. Ammonia forms a white cloud with vapor of hydrochloric acid.
3. Solution of platinic chloride, with a few drops of hydrochloric acid, if added to a solution of an ammonium salt, produces a yellow precipitate.
4. Ammonium salts are mostly colorless, and generally very soluble in water.

Official Preparations of Ammonium.

Official Name.	Composition and Preparation.
Aqua Ammoniae	10 per cent. by weight aqueous solution of NH_3 .
Aqua Ammoniae Fortior	20 per cent. by weight aqueous solution of NH_3 .
Spiritus Ammoniae	10 per cent. by weight alcoholic solution of NH_3 .
Spiritus Ammoniae Aromaticus	An aromatic hydro-alcoholic solution of ammonium carbonate.
Linimentum Ammoniae	85 C.c. ammonia water; 5 C.c. alcohol; 60 C.c. cotton seed oil.
Liquor Ammonii Acetatis	Made by mixing solution of acetic acid and ammonium carbonate.
Ammonii Benzoas	By dissolving benzoic acid in ammonia water.
Ammonii Bromidum	By adding ammonia water gradually to bromine under water.
Ammonii Carbonas	By subliming a mixture of ammonium chloride and calcium carbonate.
Ammonii Chloridum	By subliming a mixture of ammonium sulphate and sodium chloride.
Ammonii Iodidum	By mixing solutions of potassium iodide and ammonium sulphate.
Ammonii Nitras	By treating ammonium carbonate with nitric acid.
Ammonii Valerianas	By passing ammonia gas into monohydrated valerianic acid.
Trochisci Ammonii Chloridi	1.5 gr. ammonium chloride in each lozenge.

Unofficial Preparations of Ammonium.

Ammonii Arsenas, $(\text{NH}_4)_2\text{H}_2\text{AsO}_4$. Ammonium Arsenate.	Saturate a concentrated solution of arsenous acid with ammonia water and allow it to evaporate spontaneously.
Ammonii Bicarbonas, NH_4HCO_3. Ammonium Bicarbonate.	Treat 1 Gm. powdered ammonium carbonate with 2 Gm. water, and decant the liquid, the residue being the bicarbonate.
Ammonii Bichromas, $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$. Ammonium Bichromate.	Add chromic acid to ammonia water, and concentrate to crystallize.
Ammonii Boras, $2(\text{NH}_4\text{HBO}_3) \cdot 3\text{H}_2\text{O}$. Ammonium Borate.	Dissolve 1 Gm. boric acid in 3 Gm. warm ammonia water, sp. gr. 960, and allow to cool slowly.
Ammonii Carbonas Pyro-oleosus. Pyro-oleous Ammonium Carbonate.	Incorporate thoroughly 32 Gm. ammonium carbonate with 1 Gm. ethereal animal oil.
Ammonii Citras, $(\text{NH}_4)_2\text{C}_6\text{H}_5\text{O}_7 + 3\text{H}_2\text{O}$. Ammonium Citrate.	Dissolve 1 Gm. citric acid in water, add sufficient ammonia water to neutralize, filter, and concentrate to crystallize.
Ammonii et Ferri Chloridum. Ammonium and Iron Chloride.	Mix 32 Gm. ammonium chloride with 9 Gm. solution of ferric chloride, and evaporate to dryness with constant stirring.
Ammonii et Potassii Tartras. Ammonium and Potassium Tartrate.	Add ammonium carbonate to a hot solution of acid potassium tartrate until neutralized, evaporate and crystallize.
Ammonii Formas, NH_4CHO_2. Ammonium Formate.	Neutralize formic acid with ammonia water, and evaporate to crystallize.
Ammonii Fluoridum, NH_4F. Ammonium Fluoride.	Saturate hydrofluoric acid with ammonia water.
Ammonii Nitris, NH_4NO_2. Ammonium Nitrite.	Add a solution of ammonium chloride to one of silver nitrate, and evaporate the clear solution over sulphuric acid to dryness.
Ammonii Phosphas, $(\text{NH}_4)_2\text{HPO}_4$. Ammonium Phosphate.	By mixing solutions of phosphoric acid and ammonia.
Ammonii Salicylas, $(\text{NH}_4)_2\text{C}_7\text{H}_5\text{O}_3$. Ammonium Salicylate.	Neutralize salicylic acid with ammonia water, and evaporate to crystallize.
Ammonii Sulphas, $(\text{NH}_4)_2\text{SO}_4$. Ammonium Sulphate.	By saturating gas liquor with sulphuric acid and crystallizing.
Ammonii Sulphis, NH_4HSO_3. Ammonium Sulphite.	Pass sulphurous acid into an alcoholic solution of ammonia, and collect the precipitate.
Ammonii Sulphocyanidum, NH_4CNS. Ammonium Sulphocyanide.	Dissolve carbon bisulphide in alcohol, and heat in the presence of ammonia water. Lastly, concentrate to crystallize.

AQUA AMMONIÆ. U. S. Ammonia Water.

An aqueous solution of ammonia [NH_3 ; 17.01], containing 10 per cent., by weight, of the gas. It should be kept in glass-stoppered bottles, in a cool place.

Preparation.—This useful liquid is rarely prepared by the pharmacist, for the reason that it can be made more economically by the manufacturer. The official process of 1870 (see U. S. Dispensatory, 17th edition, p. 119) directed that it should be made by mixing ammonium chloride, in small pieces, with milk of lime, and placing the mixture in a retort, connected with a cooled receiver by means of a glass tube, the end of which was dipped beneath the surface of distilled water contained in the receiver. The rationale of this process is that the lime is converted into calcium chloride, whilst the ammoniacal gas, liberated by the heat, is dissolved in the distilled water.

The manufacturer rarely uses ammonium chloride: the sulphate is cheaper, and it is frequently employed instead. But upon the large scale the ammoniacal liquor obtained from gas-works is used directly

as the source, being mixed with milk of lime and heated; the gaseous ammonia is then passed through a series of tubes filled with charcoal, which retain the empyreumatic products. If the tubes are long enough, and sufficient charcoal is employed, a pure product is assured; but much of the commercial ammonia water is empyreumatic through defective purification.

Aqua Ammoniae. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.
A colorless, transparent liquid. It is completely volatilized by the heat of a water-bath. Sp. gr. 0.960 at 15° C. (59° F.).	Very pungent odor; acid, alkaline taste; strongly alkaline reaction.	Miscible in all proportions with water and alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
On bringing a glass rod dipped into hydrochloric acid near the liquid, dense white fumes are evolved. To neutralize 3.4 Gm. (3.54 C.c.) of Ammonia Water should require 20 C.c. of normal sulphuric acid (each C.c. corresponding to 0.5 per cent. of ammonia), rosolic acid being used as indicator.	Empyreuma. Readily Oxidizable Matters. Traces of Carbonic Acid. Sulphate. Chloride. Metallic Impurities. Calcium. Coal-tar Bases and fixed Impurities.	On supersaturating Ammonia Water with diluted sulphuric acid, no empyreumatic odor or red color should be developed. If to this liquid 1 C.c. of centinormal potassium permanganate V.S. be added, the pink color should not be completely destroyed within ten minutes. Ammonia Water should remain clear or be at most only faintly clouded when mixed with 4 times its volume of calcium hydrate T.S. When Ammonia Water is supersaturated with nitric acid, the liquid should remain clear on the addition of barium chloride T.S. When Ammonia Water is supersaturated with nitric acid, the liquid should remain clear on the addition of silver nitrate T.S. Either before or after neutralising Ammonia Water with hydrochloric acid, it should not be affected by hydrogen sulphide T.S. Test-solution of ammonium oxalate should not affect ammonia water if diluted with twice its volume of water. If a third portion of the acidulated liquid be evaporated on a water-bath to dryness, it should afford a colorless residue, which, on ignition, should be completely volatilized.

Uses.—Pharmaceutically, ammonia water is frequently used to precipitate iron salts by combining with the acid radicals, ferric hydrate being thrown down. Its advantage over the fixed alkalis consists in its volatility, any excess being readily detected by the odor. It is largely used for cleaning fabrics, although the strength technically known as "Aqua Ammoniae F. F. F.," or "20° Ammonia," is employed most frequently in the arts; the latter may be diluted with water, according to the formula given on page 98, if it is desirable to make official ammonia water from it. In round numbers, three parts of 20° ammonia water require two parts of water to reduce it to the strength of official ammonia water. Ammonia water is rarely used internally, the aromatic spirit being preferred. The dose is ten to twenty minims (0.6 to 1.2 C.c.), largely diluted. Externally, it is caustic and stimulating. Its old name is *Spirits of Hartshorn*.

AQUA AMMONIÆ FORTIOR. U.S. Stronger Ammonia Water.

An aqueous solution of Ammonia [NH_3 ; 17.01], containing 28 per cent., by weight, of the gas. It should be kept in strong, glass-stoppered bottles, not completely filled, in a cool place.

Preparation.—Stronger ammonia water is prepared in the same way that ammonia water is, the only difference between the two solutions being that of relative strength.

Description and Tests.—It is officially described as a colorless, transparent liquid, of an excessively pungent odor, a very acrid and alkaline taste, and a strongly alkaline reaction. Specific gravity, 0.901 at 15°C . (59°F .). Its reactions for identity and purity are the same as those of Aqua Ammonia. To neutralize 1.7 Gm. (1.88 C.c.) of Stronger Ammonia Water should require 28 C.c. of normal sulphuric acid (each C.c. corresponding to 1 per cent. of ammonia), rosolic acid being used as indicator.

Uses.—This liquid is used externally as a caustic and vesicant. It is too strong for internal administration.

SPIRITUS AMMONIÆ. U.S. Spirit of Ammonia.

An alcoholic solution of ammonia [NH_3 ; 17.01], containing 10 per cent., by weight, of the gas.

	Metric.	Old form.
Stronger Ammonia Water	250 C.c.	8 fl. oz.
Alcohol, recently distilled, and, after distillation, kept in glass vessels, a sufficient quantity,		

To make about 16 fl. oz.

Pour the Stronger Ammonia Water into a flask provided with a safety funnel, and connected by means of a glass condenser with a well-cooled receiver containing 500 C.c. [old form 16 fl. oz.] of Alcohol, the delivery tube of the condenser reaching to near the bottom of the receiver. Heat the flask carefully, and very gradually, to a temperature not exceeding 60°C . (140°F .), and maintain it at that temperature for about ten minutes. Then disconnect the receiver, and, having ascertained the ammoniacal strength of the contents by means of normal sulphuric acid (rosolic acid test-solution being used as indicator), add enough Alcohol to make the product contain *ten per cent.*, by weight, of Ammonia. Keep the Spirit in glass-stoppered bottles, in a cool place.

This is an alcoholic solution of ammonia gas, of exactly the same strength as ammonia water. The object of selecting a stronger aqueous solution of the same gas, to furnish the active ingredient, was to obtain an accurate and uniform quantity of the latter conveniently and without contamination. Practically, considerable difficulty will be experienced in maintaining the temperature of 60°C . (140°F .) for ten minutes. The amount of ammonia present is determined by a volumetric assay, in which 3.4 Gm. of the spirit of ammonia, diluted with distilled water, should require, for complete neutralization, 20 C.c. of normal sulphuric acid (each C.c. corresponding to 0.5 per cent. of Ammonia). When diluted with water it should respond to the tests and reactions for Ammonia Water. Sp. gr. 0.810.

Uses.—Spirit of ammonia is antacid and stimulant. It is not used internally to any extent, the aromatic spirit of ammonia being preferred. The dose is from ten to twenty minims (0.6 to 1.2 C.c.), largely diluted with water.

SPIRITUS AMMONIÆ AROMATICUS. U.S. Aromatic Spirit of Ammonia.

	Metric.	Old form.
Ammonium Carbonate, in translucent pieces . . .	34 Gm.	500 grains.
Ammonia Water	90 C.c.	2 fl. oz. 7 fl. dr.
Oil of Lemon	10 C.c.	2½ fl. dr.
Oil of Lavender Flowers	1 C.c.	15 minims.
Oil of Nutmeg	1 C.c.	15 minims.
Alcohol	700 C.c.	22 fl. oz. 8 fl. dr.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

To the Ammonia Water, contained in a flask, add 140 C.c. [old form 4½ fl. oz.] of Distilled Water, and afterwards the Ammonium Carbonate reduced to a moderately fine powder. Close the flask and agitate the contents until the Carbonate is dissolved. Introduce the Alcohol into a graduated bottle of suitable capacity, add the oils, then gradually add the solution of Ammonium Carbonate, and afterwards enough Distilled Water to make the product measure 1000 C.c. [old form 2 pints]. Set the liquid aside during twenty-four hours in a cool place, occasionally agitating, then filter it, through paper, in a well-covered funnel.

This preparation acquires a dark color by keeping, although nearly colorless when freshly prepared. The discoloration is due to the action of the alkali upon the alcohol and volatile oils. It should have the specific gravity of 0.905. As ordinarily prepared, from unselected ammonium carbonate, precipitation is very apt to take place: this is due to the use of exposed and effloresced ammonium carbonate, which contains more than the proper quantity of bicarbonate (see Ammonii Carbonas). The addition of ammonia water in the formula is to convert the bicarbonate into the carbonate, the latter being soluble in the mixture of water and alcohol, whilst the bicarbonate is insoluble in alcohol. Sufficient time should be given to effect the solution. The ammonium carbonate should be carefully selected, and only the translucent pieces used.

Uses.—This is a very valuable and largely used antacid and stimulant: the dose is from twenty to sixty minims (1.23 to 3.7 C.c.), largely diluted with water.

LIQUOR AMMONII ACETATIS. U.S. Solution of Ammonium Acetate.

[SPIRIT OF MINDERERUS.]

An aqueous solution of Ammonium Acetate [$\text{NH}_4\text{C}_2\text{H}_3\text{O}_2 = 76.87$], containing about 7 per cent. of the salt, together with small amounts of acetic and carbonic acids.

	Metric.	Old form.
Ammonium Carbonate	5 Gm.	865 grains.
Diluted Acetic Acid	100 C.c.	16 fl. oz.

Add the Ammonium Carbonate (which should be in translucent pieces, free from white, pulverulent bicarbonate) gradually to the cold Diluted Acetic Acid, and stir until it is dissolved.

This preparation should be freshly made when wanted.

Solution of Ammonium Acetate may also be prepared in the following manner :

	Metric.	Old form.
Ammonium Carbonate	10 Gm.	2 oz. av.
Acetic Acid	28 Gm.	4½ fl. oz.
Distilled Water	142 Gm.	about 27 fl. oz.

Dissolve the Ammonium Carbonate in 80 Gm. [old form 1 pint] of Distilled Water, and filter the solution. To the Acetic Acid add 62 Gm. [old form sufficient to make 1 pint] of Distilled Water. Keep the solutions in separate, well-stopped bottles, and, when Solution of Ammonium Acetate is to be dispensed, weigh (or, if the alternative formula is used, measure) equal quantities of each solution and mix them.

The reaction involved in this process depends upon the decomposition of the ammonium carbonate with acetic acid : the free carbonic acid is a desirable addition to the solution, which should be dispensed with a moderate amount in solution.

It will be found in practice that the last formula is much more satisfactory than the first. The solutions keep well, and it is very convenient to mix them at the time of dispensing, and thus always be enabled to send out a fresh preparation, which retains sufficient carbonic acid gas to be grateful to the patient.

Liquor Ammonii Acetatis. U.S.	TASTE AND REACTION.	SOLUBILITY.
A clear, colorless liquid, free from empyreuma. It is wholly volatilized by heat.	Mildly saline taste; neutral or slightly acid reaction.	Freely miscible with water and alcohol.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated with potassa, it evolves vapor of ammonia, and, when heated with sulphuric acid, it gives out vapor of acetic acid. It contains about 7 per cent. of ammonium acetate.	Metals.	{ It should not be darkened by hydrogen sulphide or ammonium sulphide.

Uses.—This solution is used as a diaphoretic or diuretic, in the dose of half a fluidounce (15 C.c.).

AMMONII BENZOAS. U.S. Ammonium Benzoate.

Preparation.—This salt may be advantageously prepared by the former official process, which is as follows :

Take of Benzoic Acid 2 oz. troy ; Water of Ammonia 3½ fl. oz., or

a sufficient quantity; Distilled Water 4 fl. oz. Dissolve the Acid in 3½ fl. oz. of the Water of Ammonia, previously mixed with the Distilled Water; evaporate with a gentle heat, occasionally adding Water of Ammonia, if necessary, to maintain a slight excess of the alkali; then set aside to crystallize, and dry the crystals without heat.

Ammonium Benzoate should be kept in well-stoppered bottles.

The process is one of direct combination, the reaction being as follows:

The object of retaining an excess of alkali in the process is to prevent the formation of the acid benzoate, which is less soluble than the official salt.

Ammonii Benzoas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, white, four-sided, laminar crystals, gradually losing ammonia on exposure to the air. When strongly heated, the salt melts, emits vapors having the odor of ammonia and of benzoic acid, and is finally wholly dissipated. A saturated, aqueous solution of the salt affords, with ferric chloride T.S., a flesh-colored precipitate, and, when it is gently heated with potassium or sodium hydrate T.S., the odor of ammonia is evolved.	Slight odor of benzoic acid; saline, bitter, afterwards slightly acid taste; neutral or slightly acid reaction.	At 15° C. (59° F.), 5 parts. Boiling, 1.2 parts.	At 15° C. (59° F.), 28 parts. Boiling, 7.6 parts.

IMPURITIES.

TESTS FOR IMPURITIES.

Sulphates.	{ If diluted nitric acid be added to a 10-per-cent. aqueous solution of the salt, a precipitate of benzoic acid is produced, and the filtrate from this precipitate should not be affected by barium chloride T.S. Or silver nitrate T.S.
Chlorides.	

Uses.—Ammonium benzoate is used as a stimulant diuretic, in doses of five to twenty grains (0.3 to 1.3 Gm.).

AMMONII BROMIDUM. U. S. Ammonium Bromide.

Preparation.—Several methods have been employed in making this salt: 1. By double decomposition between solutions of ammonium sulphate and potassium bromide, alcohol being added to separate the ammonium bromide. 2. By adding ammonia water to a solution of ferrous bromide. 3. By Pile's process, in which one pound of bromine is poured carefully into four times its weight of distilled water in a stone jar, adding *very gradually*, a fluidounce at a time, about one quart of ammonia water, covering the top of the jar with a glass plate when vapors arise, and, when all the ammonia has been added, and the solution is free from the smell of bromine, evaporating and granulating: the yield is about twenty ounces.

Ammonii Bromidum, U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, prismatic crystals, or a white, crystalline powder, permanent in the air. Upon ignition the salt volatilizes completely without melting.	Odorless; pungent, saline taste; slightly acid reaction.	At 15° C. (59° F.), 1.5 parts. Boiling, 0.7 part.	Cold, 30 parts. Boiling, 15 parts.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.	
The aqueous solution, when heated with potassa or sodium hydrate T.S., evolves ammonia. If a little chloroform be poured into the solution, then chlorine water added drop by drop, and the whole agitated, the chloroform will acquire a yellow or yellowish-brown color without a violet tint.	Bromate.	If diluted sulphuric acid be dropped on the salt, the latter should not at once assume a yellow color. If 3 Gm. of the well-dried salt be dissolved in distilled water to 100 C.c., 10 C.c. of this solution, after the addition of a few drops of potassium chromate T.S., should require not more than 30.9 C.c. of decinormal silver nitrate V.S. to produce a permanent red coloration.	
	More than 1 per cent. of Ammonium Chloride.		
	Metals.	A 10-per-cent. aqueous solution should not be affected by hydrogen sulphide T.S., Nor by barium chloride. 20 C.c. of a 5-per-cent. aqueous solution of the salt should not at once assume a blue color on the addition of 5 drops of potassium ferrocyanide T.S.	
	Sulphate.		
	Limit of Iron.		

Uses.—Ammonium bromide is sometimes preferred to potassium bromide as a hypnotic and sedative; it is asserted that it does not produce bromism. The dose is from ten to sixty grains (0.65 to 3.9 Gm.).

AMMONII CARBONAS. U.S. Ammonium Carbonate.

Ammonium carbonate should be kept in well-stoppered bottles, in a cool place.

Preparation.—The large consumption of this salt of ammonium has led to several methods of preparation. The one which is most used at present is the dry sublimation of ammonium chloride or ammonium sulphate with chalk or calcium carbonate: by double decomposition calcium chloride or calcium sulphate and ammonium carbonate are produced.

The advantage claimed for the use of ammonium sulphate is simply that of greater economy.

Official ammonium carbonate is, chemically, a mixed salt. It consists of one molecule of acid ammonium carbonate or bicarbonate and one of ammonium *carbamate*: the latter may be regarded as ammonium carbonate minus a molecule of water. If ammonium carbamate is dissolved in water, it is soon changed to neutral ammonium carbonate.

Hence an aqueous solution of commercial ammonium carbonate contains both the neutral and acid carbonates. If the official ammonium carbonate is exposed to the air, it is soon changed into the acid carbonate or bicarbonate, through loss of ammonia, and it is thus depreciated in quality. The bicarbonate may be converted into the carbonate by treating it with ammonia water. This fact is officially recognized in the preparation of Aromatic Spirit of Ammonia, and *smelling salts* is frequently made by coarsely grinding ammonium carbonate, placing it in a bottle, and adding strong ammonia water until it is saturated.

The principal impurity in the commercial salt is empyreuma, due to the presence of substances which communicate a disagreeable, charred odor and taste. The official test provides for the detection of empyreumatic products by first neutralizing the alkali with nitric acid and evaporating on a water-bath. The residue should be odorless and colorless.

Ammonii Carbonas. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
White, hard, translucent, striated masses, which lose both ammonia and carbonic acid gas on exposure to air, becoming opaque and finally converted into friable, porous lumps, or a white powder (Acid Ammonium Carbonate).	Strongly ammoniacal odor, free from empyreuma; sharp, saline taste, strongly alkaline reaction, and effervesces with acids.	At 15° C. (59° F.), 5 parts. Decomposed by hot water with the elimination of carbonic acid and ammonia. By prolonged boiling with water the salt is completely dissipated.	Dissolves the carbonate and leaves the Acid Ammonium Carbonate (Bicarbonate).
TESTS FOR IDENTITY AND QUANTITATIVE TEST.		IMPURITIES. TESTS FOR IMPURITIES.	
When heated, the salt is completely volatilized, without charring. If the aqueous solution is heated to near 47° C. (116.6° F.), it begins to lose carbonic acid gas, and at 88° C. (190.4° F.) it begins to give off vapor of ammonia. Dilute acids wholly dissolve the salt with effervescence.		On acidulating the aqueous solution of Ammonium Carbonate with acetic acid, no turbidity should be produced by barium chloride T.S., Nor by ammonium oxalate T.S.	
If 7.84 Gm. of unaltered Ammonium Carbonate be dissolved in water to the volume of 90 C.c., 30 C.c. of this solution (containing 2.613 Gm. of the salt) should require, for exact neutralization, 50 C.c. of normal sulphuric acid (each C.c. corresponding to 2 per cent. of the pure salt), rosolic acid being used as indicator.		Sulphate.	A 5-per-cent. aqueous solution, on the addition of a slight excess of silver nitrate T.S., and subsequent supersaturation with nitric acid, should neither assume a brown color, Nor become more than slightly opalescent within two minutes.
		Calcium.	
		Hyposulphite.	On acidulating the aqueous solution of Ammonium Carbonate with acetic acid, no turbidity should be produced by hydrogen sulphide T.S.
		Limit of Chloride.	
		Metals.	If 1 Gm. of the salt be slightly supersaturated with nitric acid, and the solution evaporated to dryness on a water-bath, it should afford a colorless and odorless residue, which, upon gentle ignition, should be completely volatilized.
		Empyreumatic or Non-volatile Matters.	

Uses.—Ammonium carbonate is a stimulant in doses of three to five grains (0.19 to 0.32 Gm.). It is generally administered in mucilaginous syrups. Pharmaceutically, it is employed in making the well-known solution of ammonium acetate, and in the aromatic spirit of ammonia, before mentioned.

AMMONII CHLORIDUM. U. S. Ammonium Chloride.

Preparation.—Sal ammoniac, as it is termed commercially, is chiefly made from *gas liquor*, the ammoniacal liquid obtained from gas-works during the destructive distillation of the coal. The ammonia is generally neutralized with hydrochloric acid, the solution evaporated, and the dry mass sublimed in iron pots. The tough, fibrous sublimate is fitted for pharmaceutical and medicinal purposes by purification. It nearly always contains traces of iron, due to the reaction of a portion of the salt upon the cast-iron dome. This may be separated by treatment with ammonia water, as shown in the following process of purification, formerly official :

Take of Chloride of Ammonium, in small pieces, 20 oz. troy ; Water of Ammonia, 5 fl. dr. ; Water, 2 pints. Dissolve the Chloride of Ammonium in the Water, in a porcelain dish, with the aid of heat ; add the Water of Ammonia, and continue the heat for a short time ; filter the solution while hot, and evaporate to dryness, with constant stirring, at a moderate heat, until it granulates : the ferrous chloride is converted into insoluble ferric hydrate, through the combination of the hydrochloric acid with ammonia water.

Ammonii Chloridum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, crystalline powder, permanent in the air. On ignition, the salt volatilizes, without charring.	Odorless; cooling, saline taste; aqueous solution has a neutral reaction.	At 15° C. (59° F.), 8 parts. Boiling, 1 part.	Very sparingly.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
Test-solution of silver nitrate, added to the aqueous solution, produces a white, curdy precipitate soluble in ammonia water.	Barium.	{ A 5-per-cent aqueous solution of the salt should remain unaffected by diluted sulphuric acid. A 5-per-cent. aqueous solution of the salt should remain unaffected by hydrogen sulphide T.S., Or barium chloride, Or ammonium oxalate.
Another portion of the aqueous solution, when gently heated with potassium or sodium hydrate T.S., evolves the odor of ammonia.	Metals.	
	Sulphate.	{ 20 C.c. of a 5-per-cent. aqueous solution should not at once assume a blue color on the addition of 5 drops of potassium ferrocyanide T.S. When acidulated with hydrochloric acid, the solution should not assume a red color on the addition of a few drops of ferric chloride T.S.
	Calcium.	
	Iron.	{ If to 1 Gm. of the salt a little nitric acid be added, and the mixture evaporated to dryness in a porcelain capsule on a water-bath, a white residue should be obtained, which, when more strongly heated, should be completely volatilized.
	Sulphocyanate.	
	Empyreumatic or Non-volatile Matters.	

Uses.—Ammonium chloride is a stimulant, and largely used as an addition to expectorant remedies, in doses of five to ten grains (0.3 to 0.65 Gm.). It is sometimes used as an inhalation in catarrh, by drawing the vapors of hydrochloric acid and ammonia into a bottle, where they combine to form ammonium chloride in very fine powder. It should never be combined with potassium chlorate, particularly in compressed tablets; for, although the combination is often desirable from a therapeutic stand-point, in time the tablets explode and serious results have been experienced. The exact results of the decomposition have not yet been determined.

AMMONII IODIDUM. U. S. Ammonium Iodide.

Ammonium Iodide should be kept in small, well-stoppered vials, protected from light. When deeply colored, the salt should not be dispensed; but it may be deprived of free iodine by adding to its concentrated, aqueous solution sufficient ammonium sulphide T.S. to render it colorless, then filtering, and evaporating on a water-bath to dryness.

Preparation.—This salt may be made by a modification of a former official process, as follows:

Take of Iodide of Potassium, in coarse powder, 4 oz. troy; Sulphate of Ammonium, in coarse powder, 867 grains; Boiling Distilled Water 2 fl. oz.; Alcohol, Water, each, a sufficient quantity. Mix the salts, add them to the Boiling Water, stir well, and allow the mixture to cool; then add a fluidounce of Alcohol, mix well, and reduce the temperature, by a bath of iced water, to about 40° F.; throw the mixture into a cool glass funnel, stopped with moistened cotton, and, when the clear solution has passed, pour upon the salt a fluidounce of a mixture containing two parts of Water and one part of Alcohol. Lastly, evaporate the solution rapidly to dryness, stirring constantly; and preserve the residue in a well-stopped bottle.

In this process double decomposition takes place, ammonium iodide and potassium sulphate being produced.

The object of cooling the mixture and adding alcohol is to cause as much of the potassium sulphate to separate as possible, potassium sulphate being almost insoluble in alcohol.

Ammonii Iodidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Minute, colorless, cubical crystals, or a white, granular powder. When heated on platinum foil, it evolves vapor of iodine, and volatilizes completely without melting. The salt is very hygroscopic, and soon becomes yellow or yellowish-brown on exposure to the air and light, owing to the loss of ammonia and the elimination of iodine.	Odorless when white, but emitting a slight odor of iodine when colored; sharp, saline taste; neutral reaction.	At 15° C. (59° F.), 1 part. Boiling, 0.5 part.	Cold, 9 parts. Boiling, 3.7 parts.

Uses.—This salt is used largely for preparing nitrogen monoxide (nitrous oxide, or laughing gas) by simply heating the ammonium nitrate and purifying the gas.

AMMONII VALERIANAS. U. S. Ammonium Valerianate.

Preparation.—This valerianate may be prepared by passing dried gaseous ammonia into monohydrated valerianic acid. The former official process may be used, which is as follows :

Take of Valerianic Acid 4 fl. oz. ; Chloride of Ammonium, Lime, each, a sufficient quantity. From a mixture of Chloride of Ammonium, in coarse powder, and an equal weight of Lime, previously slaked and in powder, contained in a suitable vessel, obtain gaseous ammonia, and cause it to pass, first through a bottle filled with pieces of Lime, and afterwards into the Valerianic Acid, in a tall, narrow, glass vessel, until the Acid is neutralized. Then discontinue the process, and set the vessel aside that the Valerianate of Ammonium may crystallize. Lastly, break the salt into pieces, drain it in a glass funnel, dry it on bibulous paper, and keep it in a well-stopped bottle.

The salt which is found in commerce is usually the acid salt : hence, in making a solution of it, as in the process for elixir of ammonium valerianate, the excess of acid should be neutralized by the addition of sufficient ammonia water.

Ammonii Valerianas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	• Ether.
Colorless, or white, quadrangular plates, deliquescent in moist air. When heated, the salt fuses, gives off vapor of ammonia and of valerianic acid, and is finally dissipated without leaving a residue.	Valerianic acid odor; sharp and sweetish taste; neutral reaction.	Very soluble.	Very soluble.	Soluble.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
The aqueous solution, if gently heated with potassium or sodium hydrate T.S., evolves the odor of ammonia, and, if supersaturated with sulphuric acid, separates an oily layer of valerianic acid on the surface.	Acetate.	{ If a neutral solution of the salt be completely precipitated with ferric chloride T.S., the filtrate should not possess a deep red color. A 5-per-cent. aqueous solution of the salt, when acidified by nitric acid, should not be affected by barium nitrate T.S.		
	Sulphate.			
	Chloride.	{ The aqueous solution of the salt, when acidified by nitric acid, should not be affected by silver nitrate T.S.		

Uses.—Ammonium valerianate is used in hysteria, neuralgia, and similar diseases as a nervine, in doses of five to twenty grains (0.3 to 1.3 Gm.). It is used pharmaceutically in the preparation of an elixir.

QUESTIONS ON CHAPTER XLI.

AMMONIUM.

Is ammonium a metal? Has it been isolated?

What is ammonium amalgam?

What are the tests for ammonium salts?

Ammonia—Give formula in symbols and molecular weight.

What is ammonia water?

How much by weight of the gas does it contain?

What is the process by which it was directed to be made in the U. S. Pharmacopoeia of 1870? Describe rationale of process.

What is its specific gravity? Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Empyreuma; traces of carbonic acid; sulphate; chloride; metallic impurities; calcium.

What is the dose?

Stronger ammonia water—How much by weight of the gas does this contain?

Give description and specific gravity. What is the dose?

Spirit of ammonia—How much gas does it contain?

How is it made? How may its strength be tested?

Give description and specific gravity. What is the dose?

Aromatic spirit of ammonia—Give Latin official name. How is it made?

Why does this preparation become dark-colored upon being kept? Give description and specific gravity.

Why is precipitation very apt to take place?

What is the object of adding aqua ammoniæ? What is the dose?

What is spirit of Mindererus? Give Latin official name.

How is it made? What is the alternative formula?

Give rationale of process. Which of the formulas is the more satisfactory, and why?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurities of metals be detected? What is the dose?

Ammonium benzoate—Give Latin official name, formula in symbols, and molecular weight.

Describe the process formerly official for making it.

Describe rationale of process.

What is the object of retaining an excess of alkali?

Describe the odor, taste, chemical reaction, and solubility. Give tests for identity.

What is the dose?

Ammonium bromide—Give Latin official name, formula in symbols, and molecular weight.

By what different methods may this be prepared?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Bromate; iodide; sulphate; more than 3 per cent. of chloride. What is the dose?

Ammonium carbonate—Give Latin official name, formula in symbols, and molecular weight.

Which is the usual process for making this salt? Give rationale of process.

Why is ammonium sulphate preferred to ammonium chloride?

What is official ammonium carbonate, chemically?

If the official salt is exposed to the air, what change takes place?

How may the bicarbonate be converted into carbonate?

What is the principal impurity in the commercial salt, and how may it be detected?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Sulphate; chloride; metals; empyreumatic substances. What is the dose?

Ammonium chloride—Give Latin official name, formula in symbols, and molecular weight.

What is its common or popular name? How is it obtained?

How may it be purified from traces of iron?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz. : Barium; metals; sulphate; iron. What is the dose?

Ammonium iodide—Give Latin official name, formula in symbols, and molecular weight.

Describe the process formerly official by which it may be made.

Give rationale of process.

What is the object of cooling the mixture and adding alcohol?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz. : Sulphate; more than about 0.5 per cent. of chloride and bromide; iron; iodine. What is the dose?

Ammonium nitrate—Give Latin official name, formula in symbols, and molecular weight.

How may it be prepared? Describe rationale of process.

How is it found in commerce?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz. : Chloride; sulphate.

For what is it used? What decomposition takes place?

Ammonium valerianate—Give formula in symbols and molecular weight.

Describe the process formerly official by which it may be prepared.

Why should ammonia water be added to the commercial salt in making solutions of it?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz. : Acetate; sulphate; chloride.

CHAPTER XLII.

MAGNESIUM, CALCIUM, BARIUM, AND STRONTIUM.

Mg; 24.08. Ca; 39.91. Ba; 136.9. Sr; 87.3.

THE compounds of these metals form a natural group. They have numerous physical and chemical characteristics in common. Barium enters into one official salt; some of its compounds are used as tests. Strontium salts were admitted to the U. S. P. 1890, and they are used to a limited extent. Magnesium was formerly classed with the alkaline earths, but it is now usually separated from them, because of its closer chemical analogies to zinc. It is so closely allied to the alkaline earths in its pharmaceutical and medical aspects that it will be most useful to consider it in its former relation.

Magnesium, in the forms of chloride, sulphate, carbonate, magnesia-calcic carbonate, and silicate, is widely distributed. The metal is of a silver-white color, losing its lustre through the oxidation of its surface, and burning with a radiant light when heated to redness, magnesia being formed. The oxide, MgO , is official, and is largely used medicinally.

Tests for Salts of Magnesium.

1. The caustic alkalies produce gelatinous, white precipitates with solutions of magnesium salts, insoluble in excess, but soluble in solution of ammonium chloride.
2. Sodium carbonate or potassium carbonate produces white precipitates with solutions of magnesium salts.
3. Solution of sodium phosphate produces a white crystalline precipitate, on the addition of a small quantity of ammonia water, of ammonio-magnesium phosphate, NH_4MgPO_4 .

Official Preparations of Magnesium.

Official Name.	Preparation.
Magnesia	Made by calcining light magnesium carbonate.
Magnesia Ponderosa	Made by calcining heavy magnesium carbonate.
Magnesium Carbonas	Double decomposition between magnesium sulphate and sodium carbonate.
Magnesium Citras Effervescens	Made from magnesium carbonate, citric acid, sodium bicarbonate, sugar, alcohol, and distilled water.
Magnesium Sulphas	By treating native magnesium hydrate with sulphuric acid.
Liquor Magnesium Citratis	By dissolving magnesium carbonate in citric acid, flavoring, and adding potassium bicarbonate.

Unofficial Salts of Magnesium.

Magnesi Acetas, $Mg(C_2H_3O_2)_2$.
Magnesium Acetate.

Magnesi Iodidum, MgI_2 .
Magnesium Iodide.

Magnesi Lactas, $Mg_2C_3H_5O_2 \cdot 3H_2O$.
Magnesium Lactate.

Magnesi Salicylas.
Magnesium Salicylate.

Magnesi Silicas, $H_2Mg_2Si_2O_9 + H_2O$.
Magnesium Silicate.

Magnesi Sulphas Exsiccatas, $MgSO_4$.
Dried Magnesium Sulphate.

Magnesi Sulphis.
Magnesium Sulphite.

Magnesi Sulphocarbolas, $Mg_2C_2H_5SO_4 \cdot 7H_2O$.
Magnesium Sulphocarbonate.

Crab Orchard Salt.

By dissolving magnesium carbonate in sufficient acetic acid, filtering and concentrating, then crystallizing.

By dissolving magnesia in hydriodic acid, filtering and concentrating, then crystallizing.

By dissolving separately in hot water 6 p. calcium lactate and 5 p. magnesium sulphate, mixing the solutions and filtering, evaporating the filtrate, then crystallizing.

Given in typhoid fever, in daily doses of fifty to one hundred grains continuously.

Occurs in nature as *asbestos*, as *meerschau*, and in other forms.

By exposing the crystallized sulphate in a warm place until it has lost 35 per cent. of its weight, then sifting it.

By treating magnesia in suspension with sulphurous acid.

By mixing concentrated solutions of barium sulphocarbonate and magnesium carbonate and collecting the precipitate.

A mild saline purgative, consisting mainly of magnesium sulphate, obtained by evaporating the waters of Crab Orchard Springs, Kentucky. Dose, from one to two teaspoonfuls.

MAGNESIA. U. S. Magnesia.

MgO ; 40.26. [LIGHT MAGNESIA. CALCINED MAGNESIA.]

Preparation.—Magnesium carbonate is exposed in crucibles to a red heat, carbon dioxide and water are expelled, and magnesia is left.

Magnesia is rendered less soluble if heated too strongly. Magnesia should always be kept in well-closed vessels: exposure to air and moisture causes the formation of carbonate and hydrate.

Magnesia. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, very light, and very fine powder, slowly absorbing moisture and carbon dioxide from the air. Magnesia is not altered or affected by heat, but, when very strongly heated, its density is increased.	Odorless; an earthy but no saline taste; faintly alkaline reaction when moistened with water.	Almost insoluble.	Insoluble.	Soluble in dilute acids.

TESTS AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
On stirring 1 part of Magnesia with 15 parts of water, in a beaker, and allowing the mixture to stand for about half an hour, it will form a gelatinous mass of sufficient consistence to prevent it from falling out when the glass is inverted. A filtered solution of Magnesia in diluted sulphuric acid, mixed with ammonium chloride T.S. and an excess of ammonia water, yields, with sodium phosphate T.S., a white, crystalline precipitate.	Limit of Calcium. Limit of Sulphate. Limit of Chloride.	This latter solution, when filtered, should not afford more than a slight opalescence with ammonium oxalate T.S., Or with barium chloride T.S., Or, after the addition of a few drops of nitric acid, with silver nitrate T.S.

TESTS.—Continued.

TESTS AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>If a mixture of 0.2 Gm. of Magnesia with 10 C.c. of water be heated to boiling, and, after cooling, 5 C.c. of the supernatant liquid be filtered off, this filtrate should not give more than a faintly alkaline reaction with litmus paper, and, when evaporated to dryness, should not leave more than a very slight residue (limit of <i>foreign soluble salts</i>).</p> <p>The Magnesia mixed with water remaining from the preceding test, when poured into 5 C.c. of acetic acid, should dissolve without the evolution of more than a few isolated gas bubbles (limit of <i>carbonate</i>).</p>	<p>Absence of Metallic Impurities.</p> <p>Limit of Water of Hydration.</p>	<p>If 0.4 Gm. of Magnesia be dissolved in 10 C.c. of diluted hydrochloric acid, the solution should be colorless, and should not be affected by hydrogen sulphide T.S., nor, after the addition of a slight excess of ammonia water, should it be immediately affected by ammonium sulphide T.S.</p> <p>If Magnesia be exposed to a low red heat in a porcelain crucible, it should not lose more than 5 per cent. of its weight.</p>

Uses.—Magnesia is popularly used as a laxative and antacid, in doses of thirty grains (1.9 Gm.). In administering, the magnesia should be added to the diluent, water or milk, and not *vice versa*.

MAGNESIA PONDEROSA. U. S. Heavy Magnesia.

MgO; 40 26.

A white, dense, and very fine powder, corresponding in all other properties and reactions with Magnesia. Heavy magnesia is preferable to the ordinary magnesia, on account of its density. This often permits the decrease in bulk of the dose in the ratio of nearly four to one. Magnesia is rendered less bulky by trituration; and if the heavy carbonate is used for the calcination, a heavier powder is produced. The tests and uses of heavy magnesia are the same as those of the light magnesia.

MAGNESII CARBONAS. U. S. Magnesium Carbonate.Approximately $(\text{MgCO}_3)_4 \cdot \text{Mg}(\text{OH})_2 + 5\text{H}_2\text{O} = 484.62$.

Preparation.—The process of the British Pharmacopoeia is as follows:

Take of Sulphate of Magnesia 10 ounces [avoirdupois]; Carbonate of Soda 12 ounces [avoird.] ; Boiling Distilled Water a sufficiency. Dissolve the Sulphate of Magnesia and Carbonate of Soda, each, in a pint [Imp. Meas.] of the Water, mix the two solutions, and evaporate the whole to perfect dryness, by means of a sand-bath. Digest the residue for half an hour with two pints [Imp. Meas.] of the Water, and, having collected the insoluble matter on a calico filter, wash it repeatedly with Distilled Water, until the washings cease to give a precipitate with chloride of barium. Finally, dry the product at a temperature not exceeding 212° F.

Magnesium carbonate varies in composition somewhat according to the process used. The reaction in making the U. S. carbonate would in its preparation be as follows:

The process for making light magnesium carbonate differs from the above in the substitution of a larger proportion of cold water for the boiling water. This furnishes a good illustration of the rule in precipitation, that dilute solutions produce light precipitates, and dense solutions heavy precipitates.

Magnesii Carbonas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Light, white, friable masses, or a light, white powder, permanent in the air. When strongly heated, it loses water and carbonic acid gas, and is converted into magnesia.	Odorless; slightly earthy taste; feebly alkaline reaction.	Almost insoluble.	Insoluble.	Soluble in dilute acids, with active effervescence.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
A filtered solution of the salt in diluted sulphuric acid, when mixed with ammonium chloride T.S. and an excess of ammonia water, yields, with sodium phosphate T.S., a white, crystalline precipitate.	Limit of Calcium.	A 2-per-cent. solution of the salt, prepared by the addition of acetic acid, should not be rendered more than slightly opalescent by ammonium oxalate, Nor by barium chloride T.S., Nor, after the addition of a few drops of nitric acid, by silver nitrate T.S. If 0.4 Gm. of the salt be dissolved in 5 C.c. of diluted hydrochloric acid, the solution should be colorless, and should not be affected by hydrogen sulphide T.S., nor, after the addition of an excess of ammonia water, should it be immediately affected by ammonium sulphide T.S.		
If the salt be boiled with water, the filtered liquid, when evaporated to dryness, should not leave more than a very slight residue.	Limit of Sulphate.			
If 1 Gm. of the salt should be ignited in a porcelain crucible, the residue should weigh not less than 0.4 Gm.	Limit of Chloride.			
	Metallic Impurities.			

Uses.—Magnesium carbonate is antacid, and in large doses cathartic. The dose is from thirty to sixty grains (1.9 to 3.8 Gm.). It has been largely employed in making medicated waters to assist in diffusing the oils used in preparing them.

MAGNESII CITRAS EFFERVESCENS. U. S. Effervescent Magnesium Citrate.

[MAGNESII CITRAS GRANULATUS. U. S. 1880.]

	Metric.	Old form.
Magnesium Carbonate	10 Gm.	8 oz. av.
Citric Acid	46 Gm.	13 oz. av. 350 gr.
Sodium Bicarbonate	34 Gm.	10 oz. av. 87 gr.
Sugar, in fine powder	8 Gm.	2 oz. av. 175 gr.
Alcohol,		
Distilled Water, each, a sufficient quantity.		

Mix the Magnesium Carbonate intimately with 30 Gm. [old form 9 oz. av.] of Citric Acid and 4 C.c. [old form 10 fl. dr.] of Distilled Water, so as to form a thick paste. Dry this at a temperature not exceeding 30° C. (86° F.), and reduce it to a fine powder. Then mix it intimately with the Sugar, the Sodium Bicarbonate, and the re-

mainder of the Citric Acid previously reduced to a very fine powder. Dampen the powder with a sufficient quantity of Alcohol, so as to form a mass, and rub it through a No. 6 tinned-iron sieve. Then dry it, and reduce it to a coarse, granular powder.

Keep the product in well-closed vessels.

This official effervescent granular salt is intended to furnish an agreeable, effervescent draught. It is very important to obey the direction to keep it in well-closed bottles, for if access of air be permitted, the moisture will soon cause the acid to act upon the carbonates and liberate the carbonic acid gas gradually, and thus destroy the effervescent character of the draught, which is its principal recommendation.

<i>Magnesii Citras Effervescent. U. S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, coarsely granular salt, deliquescent on exposure to air.	Odorless; mildly acidulous, refreshing taste; acid reaction.	At 15° C. (59° F.), 2 parts, with copious effervescence. Boiling, Very soluble.	Almost insoluble.
TESTS FOR IDENTITY.		IMPURITIES.	TEST FOR IMPURITIES.
The aqueous solution (1 in 20), after the addition of ammonium chloride T.S. and a slight excess of ammonia water, yields, with sodium phosphate T.S., a white, crystalline precipitate. If to another portion of the aqueous solution a little calcium chloride T.S. be added, and then a slight excess of ammonia water, the filtered liquid will deposit a white precipitate on boiling.		Tartrate.	{ The saturated aqueous solution of the salt, when mixed with potassium acetate and a small quantity of acetic acid, should not yield a white, crystalline precipitate.

Uses.—Effervescent magnesium citrate is given as a pleasant cathartic, in doses of one to three teaspoonfuls, in cold water.

MAGNESII SULPHAS. U. S. Magnesium Sulphate.

Preparation.—This well-known salt is prepared from a number of mineral substances, but in the United States, principally from a silicious magnesium hydrate, which is practically free from lime. The mineral is reduced to a fine powder and treated with sulphuric acid. The mass is then dried and calcined at a red heat, in order to convert into red oxide any ferrous sulphate which may be present. It is then dissolved in water, and calcium sulphide added to separate any remaining portion of iron. The salt is crystallized and dissolved a third time, in order to purify it.

In England, Epsom salt is sometimes prepared from *dolomite*, the double carbonate of magnesium and calcium, by driving off the carbon dioxide by heat, converting the residue into hydrates, and then treating

these with hydrochloric acid. Calcium chloride is formed, this is dissolved out by washing with water, and the purified magnesia is converted into sulphate by treating it with sulphuric acid.

Magnesi Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Small, colorless, rhombic prisms, or acicular crystals, slowly efflorescent in dry air. When heated to 52° C. (125.6° F.), the salt loses 1 molecule of water, and is converted into a white powder. At about 132° C. (269.6° F.) it still retains 1 molecule of water, and at a temperature of 200° to 238° C. (392° to 460.4° F.) it is rendered anhydrous.	Odorless; cooling, saline, and bitter taste; neutral reaction.	At 15° C. (59° F.), 1.5 parts. Boiling, 0.7 part.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When mixed with ammonium chloride T.S. and ammonia water, it yields, with sodium phosphate T.S., a white, crystalline precipitate. With barium chloride T.S. it yields a white precipitate insoluble in nitric acid.	Limit of Sodium. Metallic Impurities. Limit of Chloride. Iron, Zinc, or Copper. Limit of Arsenic.	When a small portion of the salt is introduced, on a clean platinum wire, into a non-luminous flame, it should not impart to the latter a persistent yellow color. A 5-per-cent. aqueous solution of the salt should not be affected by hydrogen sulphide T.S., Nor produce more than a slight opalescence with silver nitrate T.S., Nor should 20 C.c. of the same solution give any coloration or precipitate on the addition of 0.5 C.c. of potassium ferrocyanide T.S. If 1 Gm. of the powdered salt be shaken with 3 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorf's Test for Arsenic), a small piece of pure tin-foil added, and the test-tube then set aside, no coloration should appear within one hour.

Uses.—Magnesium sulphate is a valuable refrigerant cathartic, in doses of one ounce (31.1 Gm.); if dissolved in iced water, its nauseous taste is not so perceptible as when water of ordinary temperature is used.

LIQUOR MAGNESII CITRATIS. U. S. Solution of Magnesium Citrate.

	Metric.	Old form.
Magnesium Carbonate	15 Gm.	231 grains.
Citric Acid	30 Gm.	462 grains.
Syrup of Citric Acid.	60 C.c.	2 fl. oz.
Potassium Bicarbonate	2.5 Gm.	39 grains.
Water, a sufficient quantity.		

Dissolve the Citric Acid in 120 C.c. [old form 4 fl. oz.] of Water, and, having added the Magnesium Carbonate, stir, until it is dissolved. Filter the solution into a strong bottle of the capacity of about 360 C.c. [old form 12 fl. oz.], containing the Syrup of Citric Acid. Then add enough Water to nearly fill the bottle, drop in the Potassium Bicarbonate, immediately close the bottle with a cork, and secure it with twine. Lastly, shake the mixture occasionally, until the Potassium Bicarbonate is dissolved.

A few modifications in the manipulation of the official process are advisable. The bulky magnesium carbonate may be replaced by one-

half of the quantity of Jennings's light calcined magnesia. The syrup of citric acid should be introduced into the bottle, and the filtered solution of magnesium citrate very carefully poured in without stirring up the syrup. The potassium bicarbonate, in large crystals, is dropped into the bottle,—they gradually dissolve in the syrup of citric acid,—and the cork is at once inserted, to prevent loss of carbonic acid gas. The bottle is not disturbed until it is called for, when a careful shake mixes the solution of the bicarbonate in the bottom of the bottle with the acid liquid above, liberating the carbonic acid gas, and the solution can then always be dispensed in a sparkling condition.

Uses.—"Solution of citrate of magnesia," as it will probably be always called, is one of the most agreeable cathartics known. It is usually given in the quantity made by the official formula,—twelve fluidounces. The practice of dividing the dose, taking one half three or four hours after the other, is often preferable.

Calcium. Ca; 39.91.

Calcium is a very abundant element, occurring in nature as carbonate, sulphate, phosphate, silicate, chloride, fluoride, etc. It belongs to the class of metals. When heated it burns with a bright light. It is of a light yellow color, and is ductile, like gold; it may be hammered into very thin sheets. It forms but one chloride. The oxide, carbonate, sulphate, phosphate, and hypophosphite are of pharmaceutical interest.

Tests for Salts of Calcium.

1. Alkaline carbonates produce white precipitates with soluble salts of calcium, insoluble in excess.
2. The soluble oxalates (ammonium or potassium oxalate) produce, even in dilute solutions of calcium salts, a white precipitate of calcium oxalate, not soluble in an excess of acetic acid, but soluble in an excess of hydrochloric acid.

Official Preparations of Calcium.

Official Name.	Preparation.
Calx	Made by calcining chalk or limestone.
Calx Chlorata	By treating calcium hydrate with chlorine.
Calx Sulphurata	By heating lime and sulphur to a low red heat.
Calcii Bromidum	By dissolving lime in hydrobromic acid.
Calcii Carbonas Præcipitatus	By double decomposition between calcium chloride and sodium carbonate.
Calcii Chloridum	By acting on calcium carbonate with hydrochloric acid.
Calcii Hypophosphis	By heating phosphorus with milk of lime.
Calcii Phosphas Præcipitatus	By treating bone-ash with HCl, and precipitating with ammonia.
Calcii Sulphas Exsiccatus	By heating calcium sulphate.
Creta Præparata	By elutriating chalk and forming into cones.
Pulvis Cretæ Compositus	Chalk, sugar, gum, etc., for making chalk mixture.
Mistura Cretæ	Compound chalk powder suspended in cinnamon-water and water.
Trochisci Cretæ	Each containing 4 grains of prepared chalk.
Liquor Calcis	By dissolving lime in water.
Linimentum Calcis	Equal parts of lime water and linseed oil.
Syrupus Calcis	A saccharine solution of lime.
Syrupus Calcii Lactophosphatis	A saccharine solution of calcium lactophosphate.

Unofficial Salts of Calcium.

Calcii Benzoas, $\text{Ca}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$. Calcium Benzoate.	Made by adding calcium carbonate to a hot aqueous solution of benzoic acid, filtering, evaporating, and crystallizing.
Calcii Hydras, $\text{Ca}(\text{HO})_2$. Calcium Hydrate.	By adding 1 p. water to 2 p. lime contained in a metal pot, covering and setting aside to cool, sifting and preserving the fine powder.
Calcii Hyposulphis, $\text{CaS}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$. Calcium Hyposulphite.	Medical properties those of the sulphites. Dose, from ten to twenty grains (0.648 to 1.29 Gm.).
Calcii Iodas, $\text{Ca}_2\text{I}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$. Calcium Iodate.	By mixing gradually an alcoholic solution of iodine with excess of filtered aqueous solution of chlorinated lime. After decolorization, slightly acidulating with hydrochloric acid, heating to boiling, filtering, then crystallizing.
Calcii Iodidum, CaI_2 . Calcium Iodide.	By dissolving slaked lime in hydriodic acid and concentrating, then crystallizing. Dose, one to four grains (0.06 to 0.2 Gm.).
Calcii Salicylas, $\text{CaC}_7\text{H}_4\text{O}_3 + \text{H}_2\text{O}$. Calcium Salicylate.	Dose, seven to twenty grains (0.453 to 1.29 Gm.) for diarrhoea and gastro-enteritis.
Calcii Sulphidum, CaS . Calcium Sulphide.	By mixing 12 p. powdered gypsum with 4 p. powdered charcoal, and heating the mixture in a covered crucible until gas ceases to be evolved.
Calcii Sulphas, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. Calcium Sulphate.	Occurs in nature.
Calcii Sulphis, CaSO_3 . Calcium Sulphite.	By mixing concentrated solutions of sodium sulphite and calcium chloride and collecting the precipitate.
Calcii Sulphocarbolas, $\text{Ca}_2\text{C}_6\text{H}_5\text{SO}_4 \cdot 6\text{H}_2\text{O}$. Calcium Sulphocarbonate.	By mixing concentrated solutions of barium sulphocarbonate and calcium carbonate and collecting the precipitate.
Calcii Sulphydras, CaHS_2 . Calcium Sulphydrate.	By passing hydrogen sulphide into a mixture of 2 p. slaked lime and 3 p. water as long as absorbed.

CALX. U. S. Lime.

CaO ; 55.87.

Preparation.—Lime, or calcium oxide, is a very important alkaline earth, and is made by calcining limestone, or native calcium carbonate, in kilns with strong heat: carbon dioxide and water are expelled.

Calx. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Hard, white, or grayish-white masses, gradually attracting moisture and carbon dioxide on exposure to air and falling to a white powder. At the highest heat, lime does not fuse.	Odorless; sharp, caustic taste; alkaline reaction.	At 15° C. (59° F.), 750 parts. Boiling, 1300 parts.	Insoluble.	Soluble in diluted acetic, hydrochloric, or nitric acid.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.		
When heated to a white heat, Lime is neither fused nor altered. Brought into contact with about half its weight of water, it absorbs the latter, becomes heated, and is gradually converted into a white powder (calcium hydrate or slaked lime). When this is mixed with about 3 or 4 parts of water, it forms a uniform smooth magma (milk of lime). Its solution in diluted acetic acid gives, with ammonium oxalate T.S., a white precipitate insoluble in acetic acid, but soluble in hydrochloric acid.	Carbonate. Barium. Aluminum.	<p>If 1 part of Lime be slaked, and then thoroughly mixed with 50 parts of water, and the greater portion of the milky liquid decanted, no hard, gritty particles should be found in the residue, nor should the addition of hydrochloric acid to this residue cause much effervescence, nor leave more than a slight insoluble residue.</p> <p>If the decanted portion be dissolved in acetic acid and filtered, if necessary, a portion of the filtrate should not be rendered turbid by potassium dichromate T.S.</p> <p>In another portion of the filtrate, the addition of ammonia water should not produce more than a slight turbidity.</p>		

Uses.—Externally, lime acts as an escharotic: it enters into the composition of many depilatory powders; internally, in solution, it is a valuable antacid.

LIQUOR CALCIS. U. S. Solution of Lime.

[SOLUTION OF CALCIUM HYDRATE. LIME WATER.]

A saturated, aqueous solution of Calcium Hydrate [$\text{Ca}(\text{OH})_2 = 73.83$]. The percentage of Calcium Hydrate varies with the temperature, being somewhat over 0.17 per cent. at 15° C. (59° F.), and diminishing as the temperature rises.

	Metric.	Old form.
Lime	12 Gm.	185 grains.
Distilled Water, a sufficient quantity.		

Slake the Lime by the gradual addition of 70 C.c. [old form 2½ fl. oz.] of Distilled Water, then add 360 C.c. [old form 11½ fl. oz.] more of Distilled Water, and agitate occasionally during half an hour. Allow the mixture to settle, decant the liquid and throw it away. Then add to the residue 3600 C.c. [old form 7½ pints] of Distilled Water, agitate thoroughly, wait a short time for the coarser particles to subside, and pour the liquid, holding the undissolved Lime in suspension, into a glass-stoppered bottle. From time to time shake the bottle, so as to keep the solution saturated. Pour off the clear liquid when it is wanted for use.

Lime water is very extensively used in pharmacy: the object of keeping it upon undissolved Lime is to insure a saturated solution. Lime is but sparingly soluble in water, and less soluble in hot water than in cold: when the solution is heated, a deposition of lime takes place, which is redissolved on cooling. A solution of lime containing particles of undissolved lime in suspension is termed *milk of lime*.

Liquor Calcis. U. S.		ODOR, TASTE, AND REACTION.	SOLUBILITY.
A clear, colorless liquid. It absorbs carbon dioxide from the air, so that a pellicle of calcium carbonate forms on the surface of the liquid. On being heated, it becomes turbid from separation of calcium hydrate, which redissolves again when the liquid is cooled.		Odorless; saline and feebly caustic taste; strongly alkaline reaction.	Miscible with water and alcohol in all proportions.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
50 C.c. of Solution of Lime should require, for complete neutralization, about 20 C.c. of decinormal oxalic acid V.S. (corresponding to about 0.148 per cent. of Calcium Hydrate), phenolphthalein being used as indicator.	Alkalies and their Carbonates. In other respects it should conform to the reactions and tests given under Lime (see <i>Calc.</i>).	{ The alkaline reaction of the liquid entirely disappears after it has been saturated with carbon dioxide and the excess of the latter has been expelled by boiling.	

Uses.—Probably the most extensive use of lime water in medicine is in checking nausea. It is usually administered with milk when used for this purpose. It is employed externally to allay inflammation, and

in washes of various kinds. The dose of lime water is from two to four fluidounces (60 to 120 C.c.).

SYRUPUS CALCIS. U.S. Syrup of Lime.

A syrupy liquid made by boiling 65 Gm. of lime and 400 Gm. of sugar in 500 C.c. of water, and adding sufficient water to make 1000 C.c. Lime is more soluble in syrup than in water, and hence this syrup is more strongly alkaline than lime water: this is accounted for by the fact that lime forms soluble saccharates with sugar (see page 304).

LINIMENTUM CALCIS. U.S. Lime Liniment.

This liniment is made by mixing equal measures of lime water and linseed oil. It is used largely as an external application for burns, and is sometimes called Carron oil (see page 340).

CALX CHLORATA. U.S. Chlorinated Lime.*

The activity of this compound depends upon the amount of chlorine present, and it is therefore most appropriately considered under that head (see page 494).

CALX SULPHURATA. U.S. Sulphurated Lime.

[CRUDE CALCIUM SULPHIDE.]

A mixture containing at least 60 per cent. of Calcium Monosulphide [$\text{CaS} = 71.89$], together with unchanged Calcium Sulphate [$\text{CaSO}_4 = 135.73$], and Carbon, in varying proportions.

	Metric.	Old form.
Dried Calcium Sulphate, in fine powder	70 Gm.	7 oz. av.
Charcoal, in fine powder	10 Gm.	1 oz. av.
Starch	2 Gm.	87 grains.

Mix them thoroughly, pack the mixture lightly into a crucible, cover this loosely, and heat it to bright redness, until the contents have lost their black color. Allow the crucible to cool, reduce the product to powder, and at once transfer it to small, glass-stoppered vials.

This is not a definite chemical compound, but contains varying amounts of the active constituent, calcium sulphide,

Calx Sulphurata. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A pale gray powder, gradually altered by exposure to air. On dissolving Sulphurated Lime with the aid of diluted acetic acid, hydrogen sulphide gas is abundantly given off, and a white precipitate, calcium sulphate, is thrown down. The filtrate yields, with ammonium oxalate, a white precipitate, soluble in hydrochloric but insoluble in acetic acid.	Exhaling a faint odor of hydrogen sulphide; offensive alkaline taste; alkaline reaction.	Cold, Very slightly soluble. Boiling, More readily.	Insoluble.

QUANTITATIVE TEST.

If 1 Gm. of Sulphurated Lime be gradually added to a boiling solution of 2.08 Gm. of cupric sulphate in 50 C.c. of water, the mixture digested on a water-bath for fifteen minutes, and filtered when cold, no color should be imparted to the filtrate by 1 drop of potassium ferrocyanide T.S. (presence of at least 60 per cent. of pure Calcium Monosulphide).

Uses.—Sulphurated lime is used as a depilatory for removing superfluous hair from the body, by mixing a small quantity with water and applying the paste to the part. It is used internally in acne and other skin diseases: the dose is one-half grain to one grain (0.03 to 0.06 Gm.).

CALCII BROMIDUM. U. S. Calcium Bromide.CaBr₂ = 199.48.

Preparation.—Calcium bromide may be made by the simple process of adding precipitated calcium carbonate, in excess, to hydrobromic acid, filtering, evaporating the solution to dryness, and granulating the product.

It may also be made by adding milk of lime to a boiling solution of ammonium bromide until ammoniacal vapors cease to be evolved. The solution is then filtered, and the salt granulated.

Calcii Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, granular salt, very deliquescent. At a dull red heat the salt fuses without losing anything but moisture. At a higher temperature it is partially decomposed.	Odorless; sharp, saline taste; neutral reaction.	At 15° C. (59° F.), 0.7 part. Boiling, Very soluble.	Cold, 1 part. Boiling, Very soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
At 680° C. (1256° F.) the salt fuses, and at a higher temperature it is partly decomposed, with loss of bromine. An aqueous solution (1 in 20) of the salt yields, with ammonium oxalate T.S., a white precipitate soluble in hydrochloric but insoluble in acetic acid. If to 5 C.c. of the aqueous solution a few drops of chloroform be added and then 1 C.c. of chlorine water, bromine will be liberated, and, on agitating the mixture, will dissolve in the chloroform with a yellow or brownish-yellow color.	<p>Bromate.</p> <p>Nitrate or Nitrite.</p> <p>Insoluble Impurities.</p> <p>Arsenic, Lead, etc.</p> <p>Iron, Aluminium, etc.</p>	<p>If diluted sulphuric acid be dropped upon the salt, the latter should not at once assume a yellow color.</p> <p>If 1 Gm. of the salt be mixed with 0.5 Gm. of iron filings and 0.5 Gm. of powdered zinc, and heated in a test-tube with 5 C.c. of sodium hydrate T.S., no ammoniacal vapors should be evolved.</p> <p>If 1 Gm. of the salt be dissolved in 20 C.c. of water, it should form a clear, colorless solution, leaving no residue.</p> <p>If to 5 C.c. of the above aqueous solution, slightly acidulated with hydrochloric acid, an equal volume of hydrogen sulphide T.S. be added, neither coloration nor turbidity should be perceptible.</p> <p>The addition of ammonium sulphide T.S. to the aqueous solution should not produce any color or turbidity.</p>

TESTS.—Continued.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 0.25 Gm. of the well-dried salt be dissolved in 10 C.c. of water and 2 drops of potassium chromate T.S. added, it should require 25 C.c. of decinormal silver nitrate V.S. to produce a permanent red color, corresponding to 99.7 per cent. of the pure salt, a greater amount indicating the presence of chloride, a smaller amount other impurities.	Magnesium and Alkalies.	<p>If 5 C.c. of the aqueous solution (1 in 20), slightly acidulated with acetic acid, be completely precipitated with ammonium oxalate T.S., the filtrate should, on evaporation, leave not more than a trace of fixed residue.</p> <p>If to 5 C.c. of the aqueous solution (1 in 20) a few drops of starch T.S. be added, and then chlorine water, drop by drop, no blue color should appear.</p> <p>No turbidity should be produced if 0.2 C.c. of barium chloride T.S. be added to 5 C.c. of the aqueous solution.</p>
	Iodide.	
	Sulphate.	

Uses.—Calcium bromide is used as a hypnotic, in doses of thirty to sixty grains (1.9 to 3.8 Gm.).

CALCII CARBONAS PRÆCIPITATUS. U.S. Precipitated Calcium Carbonate.
CaCO₃; 99.76.

Preparation.—This salt is readily prepared by double decomposition. The following process is official in the British Pharmacopœia:

Take of Chloride of Calcium 5 oz. av.; Carbonate of Soda 13 oz. av.; Boiling Distilled Water a sufficiency. Dissolve the Chloride of Calcium and the Carbonate of Soda each in 2 pints [Imperial measure] of the Water; mix the two Solutions; and allow the precipitate to subside. Collect this on a calico filter, wash it with boiling Distilled Water until the washings cease to give a precipitate with nitrate of silver, and dry the product at the temperature of 212° (F.).

Calcium carbonate precipitates, and sodium chloride remains in solution.

The fineness of the powder is greatly promoted by using hot, dense solutions.

This salt of calcium is also obtained as a by-product in the process for making solution of chlorinated soda, double decomposition taking place between solution of chlorinated lime and solution of sodium carbonate. The precipitated calcium carbonate must be boiled in water, and afterwards thoroughly washed, to free it from the chlorinous odor. The product is unfit for internal use.

Calcii Carbonas Præcipitatus. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A fine, white powder, permanent in the air. By exposure to a red heat, with access of air, the salt loses carbon dioxide, and a residue of calcium oxide remains.	Odorless; tasteless.	Nearly insoluble. The solubility is increased by the presence of ammonium salts, and especially by carbonic acid; alkaline hydrates diminish it.	Insoluble.	Wholly soluble in hydrochloric, nitric, or diluted acetic acid, with effervescence.

TEST FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>For applying tests of identity and purity, boil 6 Gm. of Calcium Carbonate with a mixture of 50 C.c. of diluted acetic acid and 50 C.c. of water, allow the liquid to cool, and filter.</p> <p>In this solution, ammonium oxalate T.S. produces a white precipitate insoluble in acetic acid, but soluble in hydrochloric acid.</p>	Magnesium and Alkalies.	<p>If from 20 C.c. of this solution the calcium be completely precipitated by a slight excess of ammonium oxalate T.S., the filtrate should, on evaporation, leave only a trace of fixed residue.</p> <p>If 10 C.c. of the solution be slightly acidulated with acetic acid, no immediate turbidity should be produced by the addition of 0.5 C.c. of barium chloride T.S.</p> <p>If to 10 C.c. of the solution, slightly acidulated with nitric acid, 0.1 C.c. of silver nitrate V.S. be added, and the precipitate, if any, removed by filtration, the filtrate should remain perfectly clear upon addition of more silver nitrate V.S.</p> <p>Addition of ammonia water should not produce any turbidity in the solution.</p> <p>If to the solution, slightly acidulated with acetic acid, an equal volume of hydrogen sulphide T.S. be added, neither color nor turbidity should be produced.</p> <p>If 1 Gm. of the salt be agitated with 50 C.c. of water, the filtrate should not show an alkaline reaction with litmus paper, and, on evaporation, should not leave more than a trace of residue.</p>
	Sulphate.	
	Chloride.	
	Iron, Aluminum, Phosphate, etc.	
	Arsenic, Lead, etc.	
	Soluble Impurities.	

Uses.—This form of calcium carbonate, known popularly as *precipitated chalk*, is largely used in tooth-powders and similar preparations: it is inferior to the prepared chalk as an ingredient in chalk mixtures, because it does not possess the adhesive powers of the latter.

CRETA PRÆPARATA. U.S. Prepared Chalk.

Native, friable Carbonate of Calcium [$\text{CaCO}_3 = 99.76$], freed from most of its impurities by elutriation.

Preparation.—The process formerly official is as follows:

Take of Chalk *a convenient quantity*. Add a little water to the Chalk, and rub it into fine powder. Throw this into a large vessel nearly full of water, stir briskly, and, after a short interval, decant the supernatant liquor, while yet turbid, into another vessel. Treat the coarser particles of the Chalk, remaining in the first vessel, in a similar manner, and add the turbid liquid to that previously decanted. Lastly, set the liquor by, that the powder may subside, and, having poured off the water, dry the powder.

The object of this process is to effect the separation of the gritty particles in ordinary chalk by elutriation. It is usual to form the moist powder into cones by trochiscation (see page 187). Whilst elutriation effects the purification of the chalk to a certain extent, it does not separate the insoluble fine particles, and hence prepared chalk is chemically not so pure as precipitated carbonate of calcium.

Prepared chalk differs greatly in appearance from precipitated chalk, even after it has been reduced to a fine powder. It is usually not so white as the latter, and it adheres to the fingers when handled. This adhesiveness fits it for many purposes. *Whiting*, a cheap form of prepared chalk, is used for polishing.

Creta Preparata. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, amorphous powder, generally agglutinated in the form of small cones, permanent in the air. By exposure to a red heat the salt loses carbon dioxide, and is converted into lime.	Odorless; tasteless.	Almost insoluble.	Insoluble.	Soluble in diluted hydrochloric, nitric, or acetic acid, with copious effervescence, and without leaving more than a trifling residue.
TEST FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
A solution of the salt in diluted acetic acid yields, with ammonium oxalate T.S., a white precipitate soluble in hydrochloric but insoluble in acetic acid.	Barium.	A portion of a neutral solution of the salt in acetic acid should yield no precipitate with potassium dichromate T.S. If from the solution in diluted acetic acid the calcium be completely removed by precipitation with ammonium oxalate T.S. in slight excess, the filtrate should not be rendered very turbid upon addition of sodium phosphate T.S. and a little ammonia water.		
	Magnesium.			
	Iron.	A portion of a solution of the salt in acetic acid should not assume more than a slightly bluish tint with a few drops of potassium ferrocyanide T.S. Another portion of the above solution should not be rendered turbid by the addition of barium chloride T.S.		
	Sulphate.			

Uses.—This is the form of chalk which is used in medicine almost exclusively; it is an antacid, and is admirably adapted for the treatment of diarrhoea. It is used in the compound chalk powder and in troches of chalk.

CALCII CHLORIDUM. U.S. Calcium Chloride.

Calcium Chloride, rendered anhydrous by fusion at the lowest possible temperature. It should be kept in well-stoppered bottles.

Preparation.—Calcium chloride may be readily formed by saturating hydrochloric acid with chalk or marble, evaporating to dryness, and heating to redness.

It is frequently obtained as a by-product in chemical operations.

Calcii Chloridum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
White, slightly translucent, hard fragments, very deliquescent. Below a red heat the salt fuses, and, on cooling, solidifies without change in composition; but at a higher temperature, especially if kept in fusion for some time, a portion is decomposed and calcium oxide formed.	Odorless; sharp, saline taste; neutral or faintly alkaline reaction.	At 15° C. (59° F.), 1.5 parts. Boiling, Very soluble.	Cold, 8 parts. Boiling, 1.5 parts.	Insoluble in ether.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When perfectly pure, the salt dissolves in water without residue. When the salt is overheated in fusing, the solution has an alkaline reaction, and a small residue is left, which is soluble in hydrochloric acid.	Aluminum, Iron.	The aqueous solution (1 in 20) of the salt should not be precipitated by ammonia water. The aqueous solution (1 in 20) of the salt should not be precipitated by barium chloride T.S. If from 20 C.c. of the solution the calcium be completely precipitated by ammonium oxalate T.S., the filtrate should, on evaporation, leave not more than a trace of fixed residue. If 5 C.c. of the aqueous solution, acidulated with hydrochloric acid, be mixed with an equal volume of hydrogen sulphide T.S., neither color nor turbidity should appear. No turbidity should be produced by the addition of 0.5 C.c. of potassium dichromate T.S. to 5 C.c. of the aqueous solution.
The aqueous solution (1 in 20) yields, with ammonium oxalate T.S., a white precipitate insoluble in acetic acid, but soluble in hydrochloric acid.	Sulphate.	
With silver nitrate T.S. it yields a white precipitate insoluble in nitric acid.	Magnesium and Alkalies.	
	Arsenic, Lead.	
	Barium.	

Uses.—Calcium chloride, when in fused masses, is used in chemical operations for dehydrating gases: this it does through its powerful affinity for water.

CALCII HYPOPHOSPHIS. U. S. Calcium Hypophosphite.

Preparation.—This salt is made by boiling milk of lime and phosphorus together until the spontaneously inflammable gas, phosphoretted hydrogen, ceases to be evolved: it is necessary to provide for the safe escape of this gas by conducting it by a hood into a powerful draught.

The liquid is filtered to separate the insoluble phosphate and residuary lime, then concentrated, and refiltered to separate the calcium carbonate formed by the action of the air on a little lime held in solution, and lastly evaporated till a pellicle appears; after which the salt may be allowed to crystallize by setting the liquid aside, or may be obtained in the granular form by continuing the heat, and stirring.

The heat employed in evaporating the solution should not be above 85° C. (185° F.), for fear of explosions, several accidents having occurred through carelessness in this respect, even when the evaporation was conducted with a water-bath.

Calcii Hypophosphis. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, monoclinic prisms, or small, lustrous scales, or a white, crystalline powder, permanent in dry air. When heated in a test-tube, the salt decrepitates, and above 300° C. (572° F.) it begins to decompose, giving off water, and emitting inflammable gases (hydrogen and hydrogen phosphide), and leaving a residue of calcium pyrophosphate and metaphosphate, with some red phosphorus.	Odorless; nauseous, bitter taste; neutral reaction.	At 15° C. (59° F.), 6.8 parts. Boiling, 6 parts.	Insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution (1 in 20) of the salt yields, with ammonium oxalate T.S., a white precipitate soluble in hydrochloric but insoluble in acetic acid.	Phosphate, Sulphate, and other Insoluble Impurities.	If 1 Gm. of the salt be dissolved in 20 C.c. of water, no insoluble residue should be left. In the above solution no precipitate should be produced by the addition of lead acetate T.S., Nor, after acidulating with hydrochloric acid, by barium chloride T.S., Nor by an equal volume of hydrogen sulphide T.S. On adding to 5 C.c. of the solution (1 in 20) 1 C.c., each, of ammonium chloride T.S. and ammonia water, and 3 C.c. of ammonium carbonate T.S., applying a gentle heat for a few minutes, and then filtering, not more than a very slight turbidity should be produced upon adding to the filtrate a few drops of sodium phosphate T.S.
The aqueous solution, slightly acidulated with sulphuric acid, yields, with silver nitrate T.S., a precipitate which is white at first, but rapidly turns brown and black by separation of metallic silver.	Soluble Phosphate.	
With copper sulphate T.S., on gentle heating, a reddish-brown precipitate of copper hydride is formed.	Soluble Sulphate.	
When the aqueous solution is added, drop by drop, to mercuric chloride T.S., at first a white precipitate of mercurous chloride is formed, which, as soon as the hypophosphite solution is added in excess, turns gray from reduction to metallic mercury.	Arsenic, etc.	
If 0.1 Gm. of the salt be dissolved in 10 C.c. of water, then mixed with 10 C.c. of sulphuric acid and 50 C.c. of decinormal potassium permanganate V.S., and the mixture boiled for fifteen minutes, it should require not more than 3 C.c. of decinormal oxalic acid V.S. to discharge the red color (corresponding to at least 99.68 per cent. of the pure salt).	Magnesium.	

Uses.—Calcium hypophosphite is used pharmaceutically to prepare the other hypophosphites and hypophosphorous acid. Medicinally, it is used in phthisis and other wasting diseases, and in cases of defective nerve-nutrition. The dose is from ten to thirty grains (0.65 to 1.9 Gm.).

SYRUPUS HYPOPHOSPHITUM. U.S. Syrup of Hypophosphites.

This syrup is made by dissolving 45 Gm. of calcium hypophosphite and 15 Gm. each of sodium and potassium hypophosphites in water, aiding the solution by the use of 2 Gm. of diluted hypophosphorous acid. After the addition of spirit of lemon, the liquid is filtered and sufficient water and sugar are added to make 1000 C.c. of finished syrup (see page 305). There is usually a trifling residue left after dissolving the hypophosphites: this consists generally of insoluble calcium salts. Citric acid is used to dissolve the residue. The citric acid serves also to prevent precipitation in the finished syrup.

SYRUPUS HYPOPHOSPHITUM CUM FERRO. U.S. Syrup of Hypophosphites with Iron.

This preparation is made by dissolving 10 Gm. each of ferrous lactate and potassium citrate in enough syrup of hypophosphites to make 1000 C.c. It is used, like the preceding syrup, in phthisis and other wasting diseases, under the belief that the hypophosphites stimulate defective nutrition.

CALCII PHOSPHAS PRÆCIPITATUS. U.S. Precipitated Calcium Phosphate.

Preparation.—Take of Bone, calcined to whiteness, and in fine powder, 4 oz. troy; Hydrochloric Acid 8 oz. troy; Ammonia Water

12 fl. oz., or a sufficient quantity ; Distilled Water, a sufficient quantity. Macerate the Bone in the Acid, diluted with a pint of Distilled Water, until it is dissolved, and filter the solution. Add another pint of Distilled Water, and then, gradually, Ammonia Water, until the liquid acquires an alkaline reaction. Mix the precipitate obtained, while yet in the state of magma, with twice its bulk of boiling Distilled Water, and pour the whole upon a strainer. Wash the precipitate with boiling Distilled Water until the washings cease to be affected by a solution of nitrate of silver, acidulated with nitric acid. Lastly, dry the precipitate with a gentle heat.

Calcium phosphate exists in calcined bone ; it is soluble in hydrochloric acid, but is precipitated from its solution by ammonia water, ammonium chloride remaining in solution.

Calcii Phosphas Precipitatus. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A light, white, amorphous powder, permanent in the air. At an intense heat it is fusible without decomposition.	Odorless ; tasteless.	Almost insoluble. Boiling, Partly decomposed.	Insoluble.	Almost insoluble in acetic acid, except when freshly precipitated. Easily soluble in hydrochloric or nitric acid.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
Shake 2 Gm. of the salt with 20 C.c. of the water, and add nitric acid, drop by drop, until solution is effected ; then add water to make the liquid measure 40 C.c. From a portion of this solution the salt is precipitated unchanged by a slight excess of ammonia water. From another portion ammonium molybdate T.S. precipitates yellow ammonium phosphomolybdate ; the reaction is accelerated by a gentle heat. When moistened with silver nitrate T.S., a yellow color is assumed by the salt either before or after ignition (distinction from <i>acid calcium phosphate</i> , which after ignition, when moistened with silver nitrate, remains white).	Carbonate. Aluminum. Distinction from Acid Calcium Phosphate. Chloride. Sulphate. Barium. Arsenic, etc. Iron. Magnesium.	<p>Wholly soluble in nitric or in hydrochloric acid without effervescence. The precipitate formed by adding ammonia water to a solution of 1 Gm. of the salt in hydrochloric acid should yield nothing to a boiling solution of potassa.</p> <p>When moistened with silver nitrate T.S., a yellow color is assumed by the salt either before or after ignition, which, after ignition, when moistened with silver nitrate, remains white.</p> <p>If to 5 C.c. of the solution, acidulated with nitric acid, 0.5 C.c. of silver nitrate T.S. be added, not more than a slight turbidity should result.</p> <p>The clear solution should not be rendered turbid by barium chloride T.S., Nor by potassium sulphate T.S., Nor by an equal volume of hydrogen sulphide T.S., Nor should it be colored blue by potassium ferrocyanide T.S.</p> <p>If 5 C.c. of the solution be mixed with 1 C.c. of sodium acetate T.S., and then with ammonium oxalate T.S. until the calcium is completely precipitated, the filtrate should not be rendered very turbid by adding ammonia water in slight excess.</p>

Uses.—Precipitated calcium phosphate, on account of its insolubility in water, has been used in making medicated waters in preference to magnesium carbonate and other similar substances. It is administered largely now in proprietary medicines, in combination with lactic acid

and phosphoric acid, in cases of defective nutrition. The dose is from ten to thirty grains (0.6 to 1.9 Gm.).

SYRUPUS CALCII LACTOPHOSPHATIS. U.S. Syrup of Lactophosphate of Calcium.

This syrup is made by dissolving precipitated calcium carbonate in lactic and phosphoric acids. Water, orange-flower water, and sugar are added to the solution to complete the syrup (see page 303 for the working formula). It is sometimes made extemporaneously by dissolving 200 grains of calcium lactophosphate in one pint of syrup of orange flowers, which contains one fluidrachm of hydrochloric acid. It is given in doses of one to four teaspoonfuls (3.7 to 14.7 C.c.).

CALCII SULPHAS EXSICCATUS. U.S. Dried Calcium Sulphate.

[DRIED GYPSUM.]

A powder containing about 95 per cent., by weight, of Calcium Sulphate [$\text{CaSO}_4 = 135.73$], and about 5 per cent. of Water; prepared from the purer varieties of Native Gypsum [$\text{CaSO}_4 + 2\text{H}_2\text{O} = 171.65$], by carefully heating until about three-fourths of the water have been expelled. Dried Calcium Sulphate should be kept in well-closed vessels, carefully protected from moisture.

Calcii Sulphas Exsiccatus. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A fine, white powder. From moist air it attracts water, becomes granular, and then loses the property of hardening with water. When mixed with half its weight of water, Dried Calcium Sulphate forms a smooth, cohesive paste, which rapidly hardens.	Odorless and tasteless; neutral reaction.	At 15° C. (59° F.), 410 parts.	Insoluble.	It readily dissolves in diluted nitric or hydrochloric acid; also in saturated solutions of potassium nitrate, sodium hyposulphite, and various ammonium salts.
		At 38° C. (100.4° F.), 388 parts.		
		At 100° C. (212° F.), 476 parts.		
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.	
When heated above 204° C. (399.2° F.), Dried Calcium Sulphate becomes anhydrous and loses the property of forming a paste with water and hardening rapidly. It forms white precipitates with barium chloride T.S., with ammonium oxalate T.S., and with alcohol.		Carbonate.	{ No effervescence should occur on the addition of diluted acids to Dried Calcium Sulphate.	

Uses.—This substance, known commonly as *Plaster of Paris*, is largely used by surgeons in the treatment of fractures, by filling the interstices of a soft-cotton-cloth bandage with the powder and then moistening with water, and applying the bandage to the fractured part in such a way that, when the dried gypsum has hardened, a support is afforded.

PULVIS CRETÆ COMPOSITUS. U.S. Compound Chalk Powder.

The preparation is made by mixing 30 Gm. of prepared chalk with 20 Gm. of powdered acacia and 50 Gm. of powdered sugar. It is used for making chalk mixture (see Part VI.).

MISTURA CRETÆ. U.S. Chalk Mixture.

This mixture is made by rubbing 200 Gm. of compound chalk powder with 400 C.c. of cinnamon water, and adding sufficient water to make 1000 C.c. (see page 317).

TROCHISCI CRETÆ. U.S. Troches of Chalk.

Each troche contains nearly four grains of prepared chalk, with acacia, spirit of nutmeg, and sugar (see Part VI.).

Barium. Ba; 136.9.

This element furnishes one salt to the *Materia Medica* of the *Pharmacopœia*, and two of its salts are used officially in making test-solutions. *Barium* occurs abundantly as carbonate and sulphate. It is a malleable metal, having a silver-white lustre, decomposes water, and gradually oxidizes in the air.

Tests for Salts of Barium.

1. A soluble barium salt produces with sulphuric acid or soluble sulphate a white precipitate of barium sulphate, which is entirely insoluble in all acids.
2. Barium causes a colorless flame to be colored green.
3. Alkaline carbonates produce white precipitates with soluble barium salts, insoluble in excess.

Official Preparations of Barium.**Preparations.**

Barii Dioxidum.	Used in making solution of hydrogen dioxide.
Test-solution of Barium Chloride.	Used in testing for sulphates.
Test-solution of Barium Nitrate.	Used in testing for sulphates.

Unofficial Salts of Barium.

Barii Acetas, $\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)_2$. Barium Acetate.	By decomposing barium carbonate with acetic acid, evaporating, then crystallizing.
Barii Benzoas, $\text{Ba}(\text{C}_7\text{H}_5\text{O}_2)_2 + 2\text{H}_2\text{O}$. Barium Benzoate.	By adding to a solution of barium carbonate benzoic acid until neutralized, then evaporating and crystallizing.
Barii Boras. Barium Borate.	By adding to a solution of barium carbonate a solution of sodium borate, and collecting and drying the precipitate.
Barii Bromidum, $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$. Barium Bromide.	By saturating baryta water with hydrobromic acid, evaporating, then crystallizing.
Barii Chloridum, $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$. Barium Chloride. (See U. S. P. Test-Solution.)	By dissolving barium carbonate in hydrochloric acid, evaporating, then crystallizing.
Barii Chromas, BaCrO_4 . Barium Chromate.	By adding to a solution of potassium chromate baryta water, and collecting and drying the precipitate.
Barii Citras, $\text{Ba}_3\text{C}_6\text{H}_5\text{O}_7$. Barium Citrate.	By adding citric acid to baryta water in excess, and collecting the precipitate.
Barii Iodidum. Barium Iodide.	Alternative. Dose, one-eighth of a grain three times a day, gradually increased to three grains.
Barii Nitras, Ba_2NO_3 . Barium Nitrate. (See U. S. P. Test-Solution.)	By adding to a solution of barium chloride a solution of sodium nitrate, and collecting and drying the precipitate.
Barii Oxalas, $\text{BaC}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$. Barium Oxalate.	By adding a solution of oxalic acid to an excess of baryta water, and collecting the precipitate.
Barii Sulphas, BaSO_4 . Barium Sulphate.	By adding to a solution of barium chloride sulphuric acid, and collecting the precipitate.

BARIUM DIOXIDUM. U. S. Barium Dioxide. $\text{BaO}_2 = 168.82.$

[BARIUM PEROXIDE.]

Commercial, anhydrous Barium Dioxide. It should be kept in well-closed vessels.

Preparation.—Barium Dioxide (BaO_2) is made by heating barium oxide (BaO) to about 450°C . (874°F .), which causes it to take up another atom of oxygen.

Barli Dioxidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Other Solvents.
A heavy, grayish-white, or pale yellowish-white, amorphous coarse powder.	Odorless and tasteless; alkaline reaction.	Almost insoluble.	Hydrochloric, phosphoric, and other mineral acids decompose it, producing the corresponding Barium salts and hydrogen dioxide, which remain in solution for a considerable time, if the reaction has taken place in the cold and an excess of the acid is present.
TESTS FOR IDENTITY.		QUANTITATIVE TEST.	
When exposed to the air it slowly attracts moisture and carbon dioxide, and is gradually decomposed.		If 2.11 Gm. of Barium Dioxide be dissolved as completely as possible in ice-cold water to the volume of 25 C.c. with the aid of 7.5 C.c. of phosphoric acid, and 5 C.c. of this solution (corresponding to 0.422 Gm. of the Dioxide) be measured off for assay, it should require not less than 40 C.c. of decinormal potassium permanganate V.S. to impart to the liquid a permanent pink tint, corresponding to not less than 80 per cent. of pure Barium Dioxide, each C.c. of the volumetric solution indicating 2 per cent. of the latter.	
When heated to a bright red heat, Barium Dioxide fuses, loses oxygen, and is reduced to barium oxide.			
Barium Dioxide should be dissolved by diluted hydrochloric or phosphoric acid without leaving more than a trace of residue.			

Uses.—Barium dioxide is used solely for making solution of hydrogen dioxide (see page 290).

Strontium. Sr; 87.3.

Strontium enters into three official salts. It occurs in nature chiefly as sulphate and carbonate. It is a yellow metal, sp. gr. 2.5; malleable, but somewhat harder than lead. Its use in medicine is due to Laborde's demonstration in 1890 that its salts are not poisonous in ordinary doses, but, in certain cases, beneficial.

Tests for Salts of Strontium.

1. A soluble strontium salt produces with alkaline carbonates or with soluble phosphates a white precipitate.
2. Strontium causes a colorless flame to be colored red.
3. Solution of calcium sulphate produces a white precipitate with soluble strontium salts. Slow precipitation is hastened by the addition of alcohol.

Official Salts of Strontium.

- Strontii Bromidum . . . Made by dissolving strontium carbonate in hydrobromic acid.
 Strontium Bromide.
 Strontii Iodidum . . . Made by evaporating a solution of strontium hydrate in hydriodic acid.
 Strontium Iodide.
 Strontii Lactas . . . Made by dissolving freshly precipitated strontium carbonate in lactic acid.
 Strontium Lactate.

Unofficial Salts of Strontium.

Strontii Carbonas, SrCO_3 .	Occurs native as strontianite.
Strontium Carbonate.	
Strontii Chloridum, SrCl_2 .	Made by treating strontianite (native carbonate) with hot hydrochloric acid.
Strontium Chloride.	
Strontii Chromas, SrCrO_4 .	Made by precipitating a strong solution of chloride or nitrate with neutral potassium chromate.
Strontium Chromate.	
Strontii Hydras, $\text{Sr}(\text{OH})_2$.	Obtained by treating the oxide with water.
Strontium Hydrate.	
Strontii Nitras, $\text{Sr}(\text{NO}_3)_2$.	By treating the carbonate with diluted nitric acid, evaporating, and crystallizing.
Strontium Nitrate.	
Strontii Oxidum, SrO .	Obtained by heating the nitrate to redness or igniting the carbonate.
Strontium Oxide.	
Strontii Sulphas, SrSO_4 .	Occurs native as celestine.
Strontium Sulphate.	

STRONTII BROMIDUM. U. S. Strontium Bromide.

Strontium Bromide should be kept in glass-stoppered vials.

This salt may be made in several ways, but the simplest method is to dissolve strontium carbonate in hydrobromic acid and then evaporate and crystallize the salt from the solution.

Strontii Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent, hexagonal crystals, very deliquescent. When heated, the crystals at first melt, and then lose all their water (30.4 per cent.). The anhydrous salt fuses at 630°C . (1166°F .).	Odorless; bitter, saline taste; neutral reaction.	At 15°C . (59°F .), 1.5 parts. Boiling, 0.5 part.	Readily soluble.	Insoluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>To a non-luminous flame the salt communicates an intensely red color.</p> <p>With calcium sulphate T.S. the aqueous solution (1 in 20) slowly forms a white precipitate of strontium sulphate, insoluble in diluted acids; the same reaction occurs more quickly with diluted sulphuric acid, potassium sulphate T.S., and other soluble sulphates.</p> <p>With potassium chromate T.S. it forms a yellow precipitate of strontium chromate, soluble in acetic acid.</p> <p>With ammonium carbonate T.S., or sodium carbonate T.S., it forms a white precipitate of strontium carbonate, soluble, with effervescence, in acetic acid.</p> <p>If a few drops of chloroform be added to 5 C.c. of the solution, then 1 C.c. of chlorine water, and the mixture shaken, the liberated bromine will dissolve in the chloroform, communicating to it a yellow or brownish-yellow color.</p>	<p>Arænic, Lead, Copper, etc.</p> <p>Iron, Aluminium, etc.</p> <p>Barium.</p> <p>Iodine.</p> <p>Limit of Chloride.</p>	<p>The aqueous solution (1 in 20) should not be affected by hydrogen sulphide T.S. either before or after acidulation with a drop of hydrochloric acid,</p> <p>Nor by ammonium sulphide T.S.</p> <p>It should form no precipitate with potassium dichromate T.S.</p> <p>If a few drops of starch T.S. be mixed with 5 C.c. of the aqueous solution, and then one or two drops of chlorine water added, no blue color should appear.</p> <p>If 0.3 Gm. of Strontium Bromide, previously rendered anhydrous by thorough drying, be dissolved in 10 C.c. of water, and 3 drops of potassium dichromate be added, it should require not more than 24.6 C.c. of decinormal silver nitrate V.S. to produce a permanent red color (corresponding to at least 98 per cent. of the pure salt).</p>

Uses.—Strontium bromide is used in place of potassium and sodium bromides in epilepsy. Dose, twenty to sixty grains (1.3 to 3.8 Gm.).

STRONTIUM IODIDUM. U. S. Strontium Iodide.

Strontium Iodide should be kept in dark amber-colored, glass-stoppered vials.

This salt may be made by evaporating a solution of strontium hydrate in hydriodic acid.

Strontii Iodidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Colorless, transparent, hexagonal plates, deliquescent, and easily colored yellow by exposure to air and light. When cautiously heated, the crystals melt and gradually lose their water (24.05 per cent.), becoming anhydrous. At a red heat it is decomposed, losing iodine, and leaving a residue of strontium oxide.	Odorless; bitterish, saline taste; neutral or very slightly acid reaction.	At 18° C. (59° F.), 0.6 part. Boiling, 0.27 part.	Soluble.	Slightly soluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>To a non-luminous flame it communicates an intensely red color. With calcium sulphate T.S. it slowly forms a white precipitate of strontium sulphate, insoluble in diluted acids; the same reaction occurs more quickly with diluted sulphuric acid, potassium sulphate T.S., or other soluble sulphates. With potassium chromate T.S. it forms a yellow precipitate of strontium chromate, soluble in acetic acid.</p> <p>With ammonium carbonate T.S., or sodium carbonate T.S., it forms a white precipitate of strontium carbonate, soluble, with effervescence, in acetic acid. If a few drops of starch T.S. be added to 5 C.c. of the solution, and then 1 C.c. of chlorine water, a bluish-black color will appear.</p>	<p>Arsenic, Lead, Copper, etc.</p> <p>Iron, Aluminium, etc.</p> <p>Barium.</p> <p>Limit of Chloride.</p>	<p>The aqueous solution (1 in 20) should not be affected by hydrogen sulphide T.S., either before or after acidulation with a drop of hydrochloric acid.</p> <p>Nor by ammonium sulphide T.S.</p> <p>No turbidity should be produced in the aqueous solution by potassium dichromate T.S.</p> <p>If 0.3 Gm. of Strontium Iodide, previously rendered anhydrous by thorough drying, be dissolved in 10 C.c. of water and 3 drops of potassium dichromate T.S. be added, it should require not more than 18 C.c. of decinormal silver nitrate V.S. to produce a permanent red color (corresponding to at least 98 per cent. of the pure salt).</p>

Uses.—This salt has been introduced into the U. S. P. 1890 as a substitute for potassium iodide, as it is believed to be less irritating to the intestinal tract, or less depressing to the general nutrition. Dose, ten to twenty grains (0.6 to 1.3 Gm.).

STRONTIUM LACTAS. U. S. Strontium Lactate.

This salt may be made by dissolving freshly-precipitated strontium carbonate in lactic acid, filtering, evaporating, and granulating.

<i>Strontii Lactas. U. S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, granular powder, or crystalline nodules, permanent in the air. The solution, saturated at a boiling heat, remains liquid for many hours, even after being cooled to 0° C. (32° F.). When heated to 110° C. (230° F.), the salt loses its water (16.9 per cent.). At a higher temperature it first fuses, then is decomposed, giving off inflammable vapor, and leaves a residue of strontium carbonate and carbon, which, on the addition of hydrochloric acid, effervesces and communicates an intensely red color to a non-luminous flame.	Odorless; slightly bitter, saline taste; slightly acid reaction.	At 15° C. (59° F.), 4 parts. Boiling, Less than 0.5 part.	Soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>With calcium sulphate T.S. the solution slowly forms a white precipitate of strontium sulphate, insoluble in diluted acids. The same reaction occurs more quickly with diluted sulphuric acid, potassium sulphate T.S., or other soluble sulphates. With potassium chromate T.S. it forms a yellow precipitate of strontium chromate, soluble in acetic acid. With ammonium carbonate T.S., or sodium carbonate T.S., it forms a white precipitate of strontium carbonate, soluble, with effervescence, in acetic acid. If to 5 C.c. of the solution (1 in 20) 1 C.c. of sulphuric acid be added, and then 1 C.c. of decinormal potassium permanganate V.S., the red color will rapidly disappear, while the mixture will effervesce and give off the odor of aldehyde.</p> <p>If 1.33 Gm. of the salt, previously rendered anhydrous by careful drying at 110° C. (230° F.), be ignited, until most of the carbon has disappeared, and then distributed in 10 C.c. of water, it should require, for complete neutralization, not less than 9.9 C.c. of normal sulphuric acid (corresponding to at least 98.6 per cent. of the pure salt), methyl-orange being used as indicator.</p>	<p>Carbonate, Oxalate, etc.</p> <p>Arsenic, Lead, etc.</p> <p>Iron, Aluminum, etc.</p> <p>Barium.</p> <p>Limit of Chloride, etc.</p> <p>Carbonate, Oxalate, etc.</p> <p>Butyrate, Propionate, etc.</p> <p>Limit of Readily Carbonizable Organic Impurities.</p>	<p>If 1 Gm. of the salt be dissolved in 19 C.c. of water, it should form a perfectly clear, colorless solution, leaving no insoluble residue.</p> <p>The aqueous solution should not be affected by hydrogen sulphide T.S., either before or after acidulation with a drop of hydrochloric acid,</p> <p>Nor by ammonium sulphide T.S.</p> <p>No turbidity should be produced in the solution by potassium dichromate T.S.</p> <p>If 0.5 C.c. of silver nitrate T.S. be added to 5 C.c. of the aqueous solution, not more than a slight opalescence should be perceptible.</p> <p>If 0.5 Gm. of the salt be placed upon a watch-glass, and 1 C.c. of sulphuric acid be carefully poured upon it, no effervescence should occur,</p> <p>Nor should any penetrating odor be perceptible, even after gentle heating,</p> <p>Nor should the acid assume, within ten minutes, a deeper color than a pale straw-yellow.</p>

Uses.—This salt is recommended in the treatment of nephritis, rheumatism, gout, etc., in doses of ten to thirty grains (0.6 to 1.9 Gm.).

QUESTIONS ON CHAPTER XLII.

MAGNESIUM, CALCIUM, BARIUM, STRONTIUM.

- Magnesium—Give formula in symbols and molecular weight.
 How is it found?
 What are the tests for the salts of magnesium?
 Magnesia—Give formula in symbols and molecular weight.
 How is it prepared? Describe rationale of process.
 What change takes place on exposure to air and moisture?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Carbonate; more than traces of other alkaline earths; sulphates; chloride.
 What is the dose?
 Magnesia ponderosa—Wherein does this differ from magnesia?
 Magnesium carbonate—Give formula in symbols and molecular weight.
 What is the process of the British Pharmacopœia for making this?
 Describe rationale of process. How may light magnesium carbonate be prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Aluminum, or more than traces of calcium; metals; limit of sulphate; chloride.
 What is the dose?
 Effervescent magnesium citrate—Give Latin official name.
 How is it prepared, and what is the object of this preparation?
 If exposed to the air, what change takes place?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may impurity of tartrate be detected?
 What is the dose?
 Magnesium sulphate—Give formula in symbols and molecular weight.
 How is this salt obtained in the United States?
 How is it sometimes prepared in England?
 How much water of crystallization does it contain?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Metals; alkaline earths; chloride; more than about 1 per cent. of sulphate of alkalis.
 What is the dose?
 Solution of magnesium citrate—Give Latin official name.
 How is it prepared?
 What modifications of the official process are advisable?
 What is the dose?
 How much magnesia does each troche of magnesia contain?
 Calcium—Give symbol and atomic weight.
 In what forms does calcium occur?
 What are its physical properties?
 What are the tests for salts of calcium?
 Lime—Give formula in symbols and molecular weight.
 How is it obtained?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Carbonate; insoluble matter.
 What is the dose?
 Lime water—Give Latin official name.
 How is it made?
 How much calcium hydrate does it contain?
 Give formula in symbols and molecular weight of calcium hydrate.
 Is lime more soluble in hot or in cold water?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may impurities of alkalis or their carbonates be detected? What is the dose?
 How is syrup of lime made?
 What is the object of making a syrup of lime?
 What is lime liniment? What is a popular name for it?
 For what purpose is it used?

Chlorinated lime—Give Latin official name.

Upon what does the activity of this compound depend?

What is sulphurated lime? How is it made?

How much calcium sulphide should it contain? How may this be tested?

Describe odor, taste, chemical reaction, and solubility. What is the dose?

Calcium bromide—Give formula in symbols and molecular weight.

In what two ways may this preparation be made?

Explain the reaction which takes place between milk of lime and solution of ammonium bromide when mixed.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Bromate; iodide; sulphate; chloride; magnesium. What is the dose?

Precipitated calcium carbonate—Give the British official process for making it.

How may the fineness of the powder be promoted?

In what process is this salt obtained as a by-product?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Magnesium; aluminum, iron, or phosphate. What is the dose?

Which is preferred for chalk mixtures—this, or prepared chalk, and why?

What is prepared chalk?

What is the process for making it (formerly official)?

What is the object of this process?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Barium or strontium; magnesium; iron.

For what is it used, and into what official preparation does it enter?

What is whiting, and for what is it used?

Calcium chloride—Give formula in symbols and molecular weight.

How may this salt be prepared?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Aluminum or iron; sulphate; magnesium.

For what purpose is it used?

Calcium hypophosphite—Give Latin name, formula in symbols, and molecular weight.

How is this salt prepared? Describe rationale of process.

What temperature should be employed in evaporating the solution?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Insoluble calcium salts; soluble phosphate; soluble sulphate; magnesium. What is the dose?

How is syrup of hypophosphites made?

What is the object of using citric acid?

How is syrup of hypophosphites with iron made?

Precipitated calcium phosphate—Give Latin name, formula in symbols, and molecular weight.

How is it prepared?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Carbonate; aluminum.

What is the dose?

Give the Latin name of dried calcium sulphate. What is its common name or synonyme? How is it prepared? What is its composition?

Syrup of calcium lactophosphate—Give Latin official name.

How is it made? What is the dose?

Compound chalk powder—Give Latin official name.

How is it made? For what is it used?

How is chalk mixture made?

What is the composition of troches of chalk?

Barium—Give symbol and atomic weight.

What salts of barium are used officially, and for what?

How is it found in nature?

What are the tests for salts of barium?

Strontium—Give symbol and atomic weight.

What salts of strontium are used officially, and for what?

By what tests may strontium salts be recognized?

CHAPTER XLIII

ZINC, ALUMINUM, CERIUM, AND CADMIUM.

Zn; 65.1. Al; 27.04. Ce; 189.9. Cd; 111.5.

THESE metals are grouped together on account of the similarity in some of their physical properties, rather than because of the chemical analogies existing between them.

ZINCUM. U.S. Zinc.

Zn; 65.10.

Metallic Zinc, in the form of thin sheets, or irregular, granulated pieces.

Preparation.—Zinc is made by roasting *calamine*, or the impure zinc carbonate, with charcoal, in powder, and collecting the zinc by distillation, the vapors being conducted into water, where the zinc is condensed. It is bivalent, and combines with oxygen, chlorine, and phosphorus, forming zinc oxide, chloride, and phosphide, and with numerous acids to form salts.

Tests for Zinc Salts.

1. Ammonium sulphide, if added to a solution of a zinc salt containing an excess of alkaline hydrate, produces a characteristic white precipitate of zinc sulphide.
2. The alkaline hydrates of either sodium, potassium, or ammonium produce white precipitates of zinc hydrate, freely soluble in an excess of alkali.
3. Sodium and potassium carbonates yield white precipitates, insoluble in an excess.
4. The zinc salts are all colorless.

Zincum. U.S.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A bluish-white metal, showing a crystalline fracture, and having a specific gravity ranging from 6.9 when it is cast, to 7.2 after it is rolled.</p> <p>Soluble in diluted sulphuric or hydrochloric acid, with evolution of hydrogen gas.</p> <p>When heated above 100° C. (212° F.), and not above 150° C. (302° F.), the metal becomes malleable and ductile; above 200° C. (392° F.) it becomes sufficiently brittle to be powdered in an iron mortar; at 412° to 415° C. (773.6° to 779° F.) it melts, and at 940° C. (1724° F.) it boils and may be readily distilled.</p> <p>The solution should be clear and colorless, and should not yield a pure white precipitate with potassium ferrocyanide T.S., and with ammonium sulphide T.S.</p>	Sulphur.	<p>When Zinc is dissolved in diluted hydrochloric acid, the hydrogen gas which is evolved should not have any disagreeable odor, nor should it color a strip of paper moistened with lead acetate T.S.</p> <p>Or with silver nitrate T.S.</p>
	Arsenic, Antimony, Phosphorus.	
	Arsenic, Cadmium, Lead, Copper, etc.	<p>If an equal volume of hydrogen sulphide T.S. be added to the solution, neither color nor turbidity should be perceptible.</p> <p>If ammonia water be added to the solution, a white precipitate should form, which should redissolve completely in an excess of the reagent, yielding a clear, colorless solution.</p>
	Iron, Lead, Copper, etc.	

Uses.—Zinc is used in making hydrogen and in preparing the zinc salts.

Zinc and Official Preparations.

Official Name.	Preparations.
Zincum	Made by roasting the impure carbonate with charcoal and distilling.
Zinci Acetas	By treating zinc carbonate with acetic acid.
Zinci Bromidum	By double decomposition of zinc sulphate and potassium bromide.
Zinci Carbonas Præcipitatus	By double decomposition of zinc sulphate and sodium carbonate.
Zinci Chloridum	By evaporating the solution of zinc chloride.
Liquor Zinci Chloridi	By treating zinc with hydrochloric acid.
Zinci Iodidum	By digesting zinc with iodine diffused in water.
Zinci Oxidum	By calcining zinc carbonate.
Unguentum Zinci Oxidi	By incorporating zinc oxide with benzoated lard.
Zinci Phosphidum	By passing vapors of phosphorus over fused zinc in a current of dry hydrogen.
Zinci Sulphas	By acting on zinc with diluted sulphuric acid.
Zinci Valerianas	By double decomposition of zinc sulphate and sodium valerianate.
Oleatum Zinci	By sifting zinc oxide upon oleic acid and heating gently until dissolved.

Unofficial Salts of Zinc.

Zinci Cyanidum, $\text{Zn}(\text{CN})_2$. Zinc Cyanide.	By adding hydrocyanic acid to a solution of zinc acetate and collecting the precipitate.
Zinci et Potassii Cyanidum, K_2ZnCy_4 . Zinc and Potassium Cyanide.	By dissolving zinc cyanide in a solution of pure potassium cyanide, filtering, concentrating, then crystallizing.
Zinci Ferrocyanidum, $\text{Zn}_4(\text{C}_6\text{N}_8)_3\text{Fe}_3$. Zinc Ferrocyanide.	By making a solution of zinc sulphate and one of potassium ferrocyanide, mixing them, and collecting the precipitate.
Zinci Lactas, $\text{Zn}(\text{C}_3\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$. Zinc Lactate.	Dissolving, by the aid of heat, zinc carbonate in diluted lactic acid, filtering and concentrating, then crystallizing.
Zinci Salicylas, $\text{Zn}(\text{C}_7\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$. Zinc Salicylate.	By heating salicylic acid with distilled water, gradually adding zinc oxide suspended in water, until no longer dissolved, filtering, and then crystallizing.
Zinci Sulphocarbonas, $\text{Zn}(\text{C}_6\text{H}_5\text{SO}_4)_2 \cdot 8\text{H}_2\text{O}$. Zinc Sulphocarbonate.	By mixing concentrated solutions of barium sulphocarbonate and zinc carbonate and collecting the precipitate.
Zinci Tartras. Zinc Tartrate.	By mixing hot concentrated solutions of zinc sulphate and neutral potassium tartrate, collecting the precipitate, and drying it.

ZINCI ACETAS. U. S. Zinc Acetate.

Preparation.—This salt may be made by the former official process : Take of Commercial Oxide of Zinc 2 oz. troy ; Acetic Acid $8\frac{1}{2}$ fl. oz. ; Distilled Water 5 fl. oz. Mix the Acid and Water, and digest the Oxide of Zinc in the mixture for half an hour, then heat to the boiling point, filter while hot, and set aside to crystallize. Drain the crystals in a funnel, and dry them upon bibulous paper. An additional quantity of crystals may be obtained by evaporating the mother-liquor to one-half, slightly acidulating with acetic acid, and crystallizing.

The reaction is expressed as follows :

Zinci Acetas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Soft, white, six-sided, monoclinic plates, of a pearly lustre, somewhat efflorescent in dry air, losing some of its acid. When heated, the salt is partially fused, losing water and acid. At a higher temperature it is decomposed, evolving acetone and other combustible vapors, and leaving a residue of zinc oxide.	Faintly acetous odor; astringent, metallic taste; acid reaction.	At 15° C. (59° F.), 2.7 parts. Boiling, 1.5 parts.	At 15° C. (59° F.), 86 parts. Boiling, 3 parts.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.	
In the aqueous solution (1 in 20) of the salt, hydrogen sulphide T.S., as well as ammonium sulphide T.S., produces a pure white precipitate; potassium ferrocyanide T.S. also causes a white precipitate. Potassium hydrate T.S., or ammonium carbonate T.S., when added in small quantity, produces a white precipitate, which dissolves upon the addition of an excess of the reagent. The addition of a little ferric chloride T.S. produces a red color.	Arsenic, Cadmium, Lead, Copper, etc.	The aqueous solution (1 in 20), acidulated with hydrochloric acid, should not be colored or rendered turbid by an equal volume of hydrogen sulphide T.S. If the aqueous solution be completely precipitated by hydrogen sulphide T.S. (without having been acidulated), the filtrate should, after evaporation, leave no fixed residue. The aqueous solution should remain perfectly clear after the addition of either barium chloride T.S. Or silver nitrate T.S.	
The aqueous solution of the salt yields a white precipitate with test-solution of potassium ferrocyanide or of ammonium sulphide. On heating the salt with sulphuric acid, acetous vapors are evolved.	Aluminum, Iron, Alkalies, Alkaline Earths.		
	Sulphate.		
	Chloride.		

Uses.—Zinc acetate is used principally as a local remedy, in eye-washes, injections, etc.

ZINCI BROMIDUM. U. S. Zinc Bromide.

ZnBr_2 ; 224.62.

Preparation.—Zinc bromide may be made by the process suggested by Lyons, of dissolving potassium bromide and crystallized zinc sulphate, each, in the smallest quantity of hot water, and mixing while hot. When the mixture has cooled, twice its bulk of alcohol is added, and the whole filtered through asbestos to separate the potassium sulphate. The filtrate is evaporated to dryness, and the residue granulated.

This salt may also be made by adding bromine to water and dropping in *mossy zinc*, a form of metallic zinc made by pouring the pure melted metal in water (the pieces bear some resemblance to moss); zinc bromide remains in solution, and may be obtained by filtration, evaporation, and granulation.

Zinc Sulphate.	Potassium Bromide.	Zinc Bromide.	Potassium Sulphate.
----------------	--------------------	---------------	---------------------

Zinci Bromidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, granular powder, very deliquescent. When heated to 394° C. (741.2° F.), the salt fuses, and, with careful increase of heat, may be sublimed in the form of needle-shaped prisms.	Odorless; sharp, saline, and metallic taste; slightly acid reaction.	Readily soluble.	Readily soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 5-per-cent. aqueous solution of the salt yields a pure white precipitate with hydrogen sulphide T.S., ammonium sulphide T.S., or potassium ferrocyanide T.S. Silver nitrate T.S. produces a yellowish-white precipitate insoluble in ammonia water. If a few drops of copper sulphate T.S. be mixed with 5 C.c. of the aqueous solution (1 in 20) of Zinc Bromide, and then some sulphuric acid be carefully poured into the mixture so as to form a separate layer, a deep brownish-red color will appear at the line of contact, and will disappear when the mixture is shaken.</p> <p>If 0.8 Gm. of the dry salt be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should require 26.7 C.c. of decinormal silver nitrate V.S. to produce a permanent red color (corresponding to not less than 99.95 per cent. of the pure salt).</p>	<p>Iodine.</p> <p>Arsenic, Cadmium, Lead, Copper, etc.</p> <p>Iron, Aluminum, Calcium, etc.</p> <p>Alkalies, Magnesium, etc.</p>	<p>If to the aqueous solution (1 in 20) a little starch T.S. be added, and then some chlorine water, drop by drop, the liquid should assume a pure yellow color, free from any shade of blue.</p> <p>After acidulation with hydrochloric acid, the aqueous solution should not be colored or rendered turbid by the addition of an equal volume of hydrogen sulphide T.S.</p> <p>On adding ammonium carbonate T.S. to the aqueous solution of Zinc Bromide, a white precipitate is produced which should completely redissolve in an excess of the reagent.</p> <p>If from this solution in ammonium carbonate T.S. all the zinc be precipitated by ammonium sulphide T.S., the filtrate should leave no fixed residue on evaporation.</p>

Uses.—Zinc bromide is used medicinally as a hypnotic, in doses of five grains (0.3 Gm.).

ZINCI CARBONAS PRÆCIPITATUS. U.S. Precipitated Zinc Carbonate.

Preparation.—This salt may be made by the British process, as follows:

Take of Sulphate of Zinc 10 oz. av.; Carbonate of Soda 10½ oz. av.; Boiling Distilled Water a sufficiency. Dissolve the Carbonate of Soda with a pint [Imperial measure] of the Water in a capacious porcelain vessel, and pour into it the Sulphate of Zinc also dissolved in a pint [Imp. meas.] of the Water, stirring diligently. Boil for fifteen minutes after effervescence has ceased; and let the precipitate subside. Decant the supernatant liquor, pour on the precipitate 3 pints of boiling Distilled Water, agitating briskly; let the precipitate again subside; and repeat the process of effusion of hot Distilled Water and subsidence, till the washings are no longer precipitated by chloride of barium. Collect the precipitate on calico, let it drain, and dry it with a gentle heat.

If cold solutions of zinc sulphate and sodium carbonate are mixed together, neutral zinc carbonate is precipitated. This carbonate quickly decomposes, carbon dioxide being evolved, which, upon escaping, makes a portion of the precipitate soluble. This loss is prevented by conducting the precipitation at the boiling temperature, whereby the carbon dioxide is driven off as quickly as it is formed, and solution is thereby prevented.

Zinci Carbonas Precipitatus. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, impalpable powder, of somewhat variable chemical composition, permanent in the air. When strongly heated, the salt loses water and carbon dioxide, and leaves a residue of zinc oxide, which is yellow while hot, but becomes white on cooling.	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in diluted acids with copious effervescence. Soluble in ammonia water, and in ammonium carbonate T.S.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
When a small portion of the salt is moistened with a drop of cobaltous nitrate T.S., and heated before the blowpipe, it will assume a vivid green color.	Arsenic, Cadmium, Lead, Copper, etc.	In another portion of the filtrate, acidulated with hydrochloric acid, no color or turbidity should be produced by the addition of an equal volume of hydrogen sulphide T.S. Another portion of the filtrate should yield with ammonium carbonate T.S. a white precipitate, which should redissolve completely in an excess of the reagent. No insoluble residue should be left, if 0.5 Gm. of Zinc Carbonate be dissolved in 10 C.c. of diluted sulphuric acid. If 1 Gm. of the salt be placed in a flask with 10 C.c. of boiling water, and 2 drops of phenolphthalein T.S. be added, not more than 1 C.c. of decinormal oxalic acid V.S. should be required to discharge the red color.		
For making tests of identity and purity, add 10 C.c. of diluted sulphuric acid and 10 C.c. of water to 1.25 Gm. of the salt, and, after effervescence has ceased, remove the undissolved excess by filtration. In a portion of the filtrate a pure white precipitate is produced by potassium ferrocyanide T.S., or by ammonium sulphide T.S.	Iron, Aluminum, Calcium, etc.			
	Lead.			
	Limit of Alkali.			

Uses.—Precipitated zinc carbonate is used principally in ointments, and takes the place of the former impure carbonate termed *calamine*. It is sometimes dusted upon inflamed surfaces as an astringent and absorbent.

ZINCI CHLORIDUM. U.S. Zinc Chloride.

ZnCl_2 ; 185.84.

Preparation.—Zinc chloride is easily prepared by digesting metallic zinc in hydrochloric acid and evaporating the solution to dryness; or, preferably, by evaporating the official solution of zinc chloride.

Zinci Chloridum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, granular powder, or porcelain-like masses, irregular, or moulded into pencils. Very deliquescent. The salt should be dissolved in much water for tasting. When heated to 115° C. (239° F.), it fuses to a clear liquid. At a higher temperature it is partly volatilized in dense, white fumes, and partly decomposed, leaving a residue of zinc oxide.	Odorless; very caustic, astringent, and metallic taste; acid reaction.	At 15° C. (59° F.), 0.3 part, forming a clear solution, which, on protracted boiling, deposits a basic salt.	Very soluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 5-per-cent. aqueous solution of the salt yields, with potassium ferrocyanide T.S., a pure white precipitate, and with ammonium carbonate T.S. a white precipitate, which redissolves in an excess of the reagent.</p> <p>Silver nitrate T.S. produces a white precipitate insoluble in nitric acid.</p> <p>If 0.3 Gm. of dry Zinc Chloride be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, it should require 44.1 C.c. of decinormal silver nitrate V.S. to produce a permanent red color (corresponding to not less than 99.84 per cent. of the pure salt).</p>	<p>Limit of Oxy-chloride.</p> <p>Arsenic, Cadmium, Lead, Copper, etc.</p> <p>Iron, Aluminum, Calcium, etc.</p> <p>Alkalies, Magnesium, etc.</p> <p>Sulphate.</p>	<p>The aqueous solution (1 in 20) should be clear, or at most only very slightly opalescent; and, if it be mixed with an equal volume of alcohol, a single drop of hydrochloric acid should suffice to render 10 C.c. of the mixture perfectly clear.</p> <p>If to the aqueous solution, acidulated with hydrochloric acid, an equal volume of hydrogen sulphide T.S. be added, it should not become colored or turbid.</p> <p>If ammonium carbonate T.S. be added to the solution, the precipitate should be of a pure white color, and redissolve completely in an excess of the reagent.</p> <p>If from this solution in ammonium carbonate T.S. the zinc be completely precipitated by ammonium sulphide T.S., the filtrate should leave no fixed residue on evaporation.</p> <p>The aqueous solution should not be rendered turbid by the addition of barium chloride T.S.</p>

Uses.—Zinc chloride in solution is used as an antiseptic and disinfectant (see *Liquor Zinci Chloridi*, below). Externally, mixed with flour and water, it is used as an escharotic.

LIQUOR ZINCI CHLORIDI. U.S. Solution of Zinc Chloride.

An aqueous solution of Zinc Chloride [$\text{ZnCl}_2 = 185.84$], containing about 50 per cent., by weight, of the salt.

	Metric.	Old form.
Zinc, granulated	240 Gm.	6½ oz. av.
Hydrochloric Acid	840 Gm.	22 oz. av.
Nitric Acid	12 Gm.	100 minims.
Precipitated Zinc Carbonate	12 Gm.	186 grains.
Distilled Water, a sufficient quantity.		

To the Zinc, contained in a glass or porcelain vessel, add 150 C.c. [old form 4½ fl. oz.] of Distilled Water; then gradually add the Hydrochloric Acid, and digest, until the Acid is saturated. Pour off the solution, add the Nitric Acid, evaporate the solution to dryness, and heat the dry mass to fusion at a temperature not exceeding 115° C. (239° F.). Let it cool, and dissolve it in a sufficient amount of Distilled Water to make the product weigh 1000 Gm. [or measure, old form, 1 pint]. Then add the Precipitated Zinc Carbonate, agitate the mixture occasionally during twenty-four hours, and then set it aside until it has become clear by subsidence. Finally, separate the clear solution by decantation, or by means of a siphon.

When zinc is treated with hydrochloric acid, hydrogen is evolved and zinc chloride is produced.

Zinc is almost invariably contaminated with iron, and more or less ferrous chloride is present in the first solution. Nitric acid is added, and the solution is evaporated to dryness. The iron salt is thus oxidized, and it is then precipitated by the addition of zinc carbonate, the insoluble ferric hydrate and carbonate, with any excess of zinc carbonate, being filtered out.

Solution of chloride of zinc is a clear, colorless liquid, odorless, having a very astringent, sweetish taste, and an acid reaction. Sp. gr. 1.535. (See *Zinci Chloridum*, page 637, for the tests.)

Uses.—This solution, sometimes called *Burnett's disinfecting fluid*, is used principally as an antiseptic and disinfectant. Among its advantages, absence of odor is one of the most prominent.

ZINCI IODIDUM. U. S. Zinc Iodide.

ZnI_2 ; 818.16.

Preparation.—Zinc iodide may be formed by digesting an excess of zinc with iodine diffused in water, in a manner similar to that used in making the corresponding iron salt.

Zinci Iodidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
<p>A white, granular powder, very deliquescent, and liable to absorb oxygen from the air, and to become brown from liberated iodine.</p> <p>When heated to about 446°C. (834.8°F.), the salt fuses to a colorless liquid, and at a higher temperature sublimes, forming quadratic needles, while a small part is decomposed and leaves a residue of zinc oxide.</p>	Odorless; sharp, saline, and metallic taste; acid reaction.	Readily soluble.	Readily soluble.	Readily soluble in ether.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 5-per-cent. aqueous solution of the salt yields a pure, white precipitate with potassium ferrocyanide T.S., or with ammonium sulphide T.S. With silver nitrate T.S. it yields a pale yellow precipitate, insoluble in ammonia water; with mercuric chloride T.S. a scarlet-red precipitate, soluble in potassium iodide T.S.</p> <p>If 0.5 Gm. of dry Zinc Iodide be dissolved in 10 C.c. of water, and 2 drops of potassium chromate T.S. be added, not more than 31.4 C.c. nor less than 31 C.c. of decinormal silver nitrate V.S. should be required to produce a permanent red color (31.4 C.c. corresponding to 100 (99.9) per cent., and 31 C.c. to 98.62 per cent., of pure Zinc Iodide).</p>	<p>Arsenic, Cadmium, Lead, Copper, etc.</p> <p>Sulphate.</p> <p>Iron, Aluminum, Calcium, etc.</p> <p>Alkalies, Magnesium, etc.</p>	<p>The aqueous solution, acidulated with hydrochloric acid, should not be colored or rendered turbid by hydrogen sulphide T. S.,</p> <p>Nor by barium chloride T.S.</p> <p>If ammonium carbonate T.S. be added to the aqueous solution, a pure white precipitate will form, which should redissolve completely in an excess of the reagent.</p> <p>If from the solution in ammonium carbonate T.S. all the zinc be precipitated by ammonium sulphide T.S., the filtrate should leave no fixed residue on evaporation.</p>

Uses.—Zinc iodide is used as an alternative, in doses of one-half grain to two grains (0.03 to 0.12 Gm.).

ZINCI OXIDUM. U. S. Zinc Oxide.

Preparation.—Zinc oxide may be prepared by the former official process, as follows:

Take of Precipitated Carbonate of Zinc 12 oz. troy. Expose it, in a shallow vessel, to a low red heat until the water and carbonic acid are wholly expelled.

Commercial zinc oxide is made on the large scale by heating calamine and coal ground together, roasting in a furnace of peculiar construction, and separating the impurities by blowing the mixed vapors up a large tower, allowing the heavier particles to subside in the tower, and then by a powerful draught blowing the zinc oxide into a room containing muslin bags, when the oxide is deposited.

Zinci Oxidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
An amorphous, white powder. It gradually absorbs carbon dioxide from the air. When heated, the Oxide assumes a yellow color, but turns nearly white again on cooling.	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in diluted acids without effervescence; also in ammonia water and in ammonium carbonate T.S.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
If a small portion be moistened with a drop of cobaltous nitrate T.S., and heated before the blowpipe, it will assume a vivid green color. For making tests of identity and purity, digest 1 Gm. of Zinc Oxide during 1 hour, with occasional agitation, in a mixture of 10 C.c. of diluted sulphuric acid and 10 C.c. of water; then remove the undissolved Zinc Oxide by filtration. In a portion of the filtrate a pure white precipitate is produced by potassium ferrocyanide T.S., or by ammonium sulphide T.S.	Arsenic, Cadmium, Lead, Copper, etc.	In another portion of the filtrate, acidulated with hydrochloric acid, no color or turbidity should be produced by an equal volume of hydrogen sulphide T.S. Another portion of the filtrate should yield with ammonium carbonate T.S. a pure white precipitate, which should redissolve completely in an excess of the reagent.
	Iron, Aluminum, Calcium, etc.	
	Alkalies, Magnesium, etc.	If from this solution in ammonium carbonate T.S. the zinc be completely precipitated by ammonium sulphide T.S., the filtrate should, on evaporation, leave no fixed residue.
	Chloride.	In another portion of the filtrate silver nitrate T.S. should not produce a turbidity.
	Alkaline Carbonate, etc.	If Zinc Oxide be agitated for some time with water, and a drop of phenolphthalein T.S. be added, no red color should appear.
	Carbonate.	If 10 C.c. of diluted sulphuric acid be added to 0.5 Gm. of Zinc Oxide, no effervescence should occur,
	Lead, Silicate, etc.	And a perfectly clear solution should result.
	Sulphate.	If Zinc Oxide be dissolved in diluted hydrochloric acid, the solution should remain perfectly clear after the addition of barium chloride T.S.

Commercial zinc oxide will not usually conform to the official tests: it is generally very white and filled with hard lumps, which are diffi-

cult to reduce to powder. The official powder has a decided cream tint, and can be mixed with ointment so that a smooth preparation is easily made without trituration. (See Unguentum Zinci Oxidi.)

Uses.—Zinc oxide is rarely used internally; externally, it is used as an exsiccant to inflamed surfaces, and it may be dusted on the part or used in the form of an ointment.

UNGUENTUM ZINCI OXIDI. U. S. Ointment of Zinc Oxide.

Made by incorporating 20 Gm. of zinc oxide with 80 Gm. of benzoated lard.

OLEATUM ZINCI. U. S. Oleate of Zinc.

Made by dissolving 50 Gm. of zinc oxide in 950 Gm. of oleic acid by the aid of a gentle heat.

ZINCI PHOSPHIDUM. U. S. Zinc Phosphide.

Preparation.—Zinc phosphide is made by passing vapors of phosphorus in a current of dry hydrogen over fused zinc. The product is a spongy, gray mass, of metallic appearance, containing rhomboidal crystals, and when powdered somewhat resembling reduced iron. The metallic particles of zinc should be separated. It is a heavy powder, its sp. gr. being 4.72.

Zinci Phosphidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A gritty powder of a dark gray color, or crystalline fragments of a dark metallic lustre. In contact with air it slowly emits phosphorous vapor. When strongly heated, with exclusion of air, it melts, and finally sublimes. When heated in air, it becomes oxidized to zinc phosphate.	Faint odor and taste of phosphorus.	Insoluble.	Insoluble.	Soluble in diluted hydrochloric or sulphuric acid with evolution of hydrogen phosphide.

IMPURITIES.

TESTS FOR IMPURITIES.

Insoluble Impurities.	{ If 0.5 Gm. of Zinc Phosphide be dissolved in 15 C.c. of diluted hydrochloric acid, heat being applied to expel all the hydrogen phosphide gas, a clear solution should result, leaving no residue. A portion of this solution should yield a pure white precipitate with potassium ferrocyanide T.S., Or with ammonium sulphide T.S. If another portion of this solution be mixed with an equal volume of hydrogen sulphide T.S., no color or turbidity should appear.
Iron or Copper.	
Lead or Copper.	
Arsenic, Cadmium, Lead, Copper, etc.	

Uses.—Zinc phosphide is used as a nervous stimulant and aphrodisiac: it is frequently preferred to phosphorus for these purposes. The dose is one-twentieth to one-eighth of a grain (0.003 to 0.008 Gm.).

ZINCI SULPHAS. U. S. Zinc Sulphate.

Preparation.—Zinc sulphate is made by acting on metallic zinc with diluted sulphuric acid, hydrogen being evolved; the resulting solution is freed from the contamination of iron by first passing chlorine into it, when ferric chloride is produced, and, upon the addition of zinc carbonate, decomposition takes place, ferric hydrate separating as an insoluble precipitate, which is removed by filtration, and a small quantity of zinc chloride is formed, which, being very soluble, remains in the mother-liquor after the crystallization of the sulphate.

Zinci Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless, transparent, rhombic crystals, efflorescent in dry air. When rapidly heated the salt melts. At a higher temperature it is partly decomposed, losing both water and sulphuric acid. When very gradually heated to 50° C. (122° F.), it loses 5 molecules of its water (31.3 per cent.), without melting. At 100° C. (212° F.) a sixth molecule is lost, while the last may be removed by a current of dry air at 110° C. (230° F.).	Odorless; astringent, metallic taste; acid reaction.	At 15° C. (59° F.), 0.6 part. Boiling, 0.2 part.	Insoluble.	Soluble in about 3 parts of glycerin.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>A 5-per-cent. aqueous solution yields a pure white precipitate with potassium ferrocyanide T.S., also with ammonium sulphide T.S., and with barium chloride T.S.</p> <p>If a small portion of the salt be moistened with a drop of cobaltous nitrate T.S., and heated before the blowpipe, it will assume a vivid green color.</p>	<p>Lead and Other Insoluble Matters.</p> <p>Arsenic, Cadmium, Copper, etc.</p> <p>Iron, Aluminum, Calcium, etc.</p> <p>Alkalies, Magnesium, etc.</p> <p>Chloride.</p> <p>Free Acid.</p>	<p>No residue should be left on dissolving 1 Gm. of the salt in 20 C.c. of water.</p> <p>The aqueous solution (1 in 20), after being acidulated with hydrochloric acid, should not be colored or rendered turbid by an equal volume of hydrogen sulphide T.S.</p> <p>The aqueous solution should yield with ammonium carbonate T.S. a pure white precipitate, which should redissolve completely in an excess of the reagent.</p> <p>If from this solution in ammonium carbonate T.S. the zinc be completely precipitated by ammonium sulphide T.S., the filtrate should leave no fixed residue on evaporation.</p> <p>The aqueous solution (1 in 20) should not be rendered turbid by silver nitrate T.S.</p> <p>If 1 Gm. of Zinc Sulphate, in small fragments, be agitated for some time with 10 C.c. of alcohol, the filtrate should not red-dened moistened blue litmus paper.</p>

Uses.—This salt is the most important of those made from zinc. It is used medicinally as a prompt and certain emetic in doses of ten

to thirty grains (0.6 to 1.9 Gm.); as a tonic and astringent, one to two grains (0.06 to 0.13 Gm.).

ZINCI VALERIANAS. U. S. Zinc Valerianate.

Preparation.—The process for making this salt affords an illustration of the rather rare operation of “upward precipitation,” the crystals of zinc valerianate being lighter than the mixed solutions:

Take of Sodium Valerianate $2\frac{1}{2}$ oz. troy; Zinc Sulphate 2 oz. troy, 420 grains; Distilled Water a sufficient quantity. Dissolve the salts separately, each in 20 fluidounces of Distilled Water, and, having heated the solutions to 100°C . (212°F .), mix them, and set the mixture aside to crystallize. Decant the mother-water from the crystals, and put them upon a filter in a funnel to drain. Mix the mother-water and the drainings, evaporate at a heat not exceeding 93.3°C . (200°F .) to 4 fluidounces, and again set aside to crystallize. Add the crystals, thus obtained, to those in the funnel, wash the whole with a little Distilled Water, and, having removed them with the filter, spread them on bibulous paper, and dry them with a heat not exceeding 93.3°C . (200°F .).

Zinci Valerianas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
White, pearly scales, permanent in the air. When heated, the salt melts; at a higher temperature it is decomposed, giving off inflammable vapors, and finally leaves a residue of zinc oxide.	Odor of valerianic acid; sweet, afterwards styptic and metallic taste; acid reaction.	At 15°C . (59°F .), 100 parts.	At 15°C . (59°F .), 40 parts.
		Boiling renders the solution turbid from loss of acid and formation of a basic salt.	

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
If 0.5 Gm. of Zinc Valerianate be dissolved in a mixture of 0.5 C.c. of hydrochloric acid and 4.5 C.c. of water, the valerianic (isovalerianic) acid will be liberated, and float as an oily layer on the surface of the liquid.	Arsenic, Cadmium, Lead, Copper, etc.	After its removal, the clear solution should be neither colored nor rendered turbid by the addition of an equal volume of hydrogen sulphide T.S. Zinc Valerianate should dissolve without residue in ammonia water. If from this solution the zinc be completely precipitated by ammonium sulphide T.S., the precipitate should have a pure white color, and the filtrate should leave no fixed residue on evaporation. If 0.5 Gm. of Zinc Valerianate be triturated with 2 C.c. of water and 0.2 C.c. of ferri chloride T.S. added, the filtrate should not show a red color. If a concentrated solution of copper acetate in water be added to a concentrated aqueous solution of Zinc Valerianate, the mixture should remain perfectly clear.
	Iron.	
	Alkalies, Magnesium, etc.	
	Acetate.	
	Butyrate.	

Uses.—Zinc valerianate is used as a nervine and antispasmodic, in doses of one to three grains (0.06 to 0.19 Gm.).

Aluminum. Al; 27.04.

This metal is found largely in combination with silicic acid, in the rocks and clays forming a great portion of the earth's surface. Some of the precious stones and valuable minerals are compounds of aluminum; the ruby and sapphire, corundum and emery, are crystallized forms of aluminum oxide. Aluminum is of a silver-white color. The metal, owing to improvements in its extraction, is much cheaper than it was formerly, and it is used in making ornamental and useful articles. Owing to its very low specific gravity (2.67), it is used for grain weights, because they are much larger, and thus more easily handled, than they would be if made from brass (see page 68). Aluminum forms but one class of compounds, in which it is trivalent. The oxides and sulphates unite with those of the alkali metals and form double salts called *alums*.

Tests for Salts of Aluminum.

1. Potassium or sodium hydrate produces white, gelatinous precipitates of aluminum hydrate in solutions of alum, which are freely soluble in excess of the alkali.
2. Water of ammonia produces a similar precipitate, insoluble in excess.
3. The alkaline carbonates precipitate the hydrate, carbon dioxide being evolved.
4. Ammonium sulphide also precipitates the hydrate, sulphuretted hydrogen being evolved.

Official Preparations of Aluminum.

Official Name.	Preparation.
Alumen	By treating alum-clay with sulphuric acid and potassium sulphate.
Alumen Exsiccatum	By heating alum to a temperature of 205° C. (401° F.).
Alumini Hydras	By double decomposition of alum and sodium carbonate.
Alumini Sulphas	By treating aluminum hydrate with sulphuric acid and crystallizing.

Unofficial Preparations of Aluminum.

Alumini Acetas, $\text{Al}_2(\text{C}_2\text{H}_3\text{O}_2)_3$.	By dissolving aluminum hydrate in cold acetic acid, filtering and concentrating, then crystallizing.
Aluminum Acetate.	
Alumini Bromidum, Al_2Br_6 .	By passing the vapor of bromine over a heated mixture of alumina and carbon.
Aluminum Bromide.	
Alumini Chloridum, Al_2Cl_6 .	By dissolving aluminum hydrate in hydrochloric acid and evaporating carefully, then crystallizing.
Aluminum Chloride.	
Alumini Iodidum, Al_2I_6 .	By heating aluminum and iodine together in closed tubes and collecting the crystals.
Aluminum Iodide.	
Alumini Nitras, $\text{Al}_2(\text{NO}_3)_6 \cdot 18\text{H}_2\text{O}$.	By dissolving aluminum hydrate in nitric acid, filtering and concentrating, then crystallizing.
Aluminum Nitrate.	
Alumini Oxidum, Al_2O_3 .	Occurs in nature.
Aluminum Oxide.	
Alumini Phosphas, $\text{Al}_2(\text{PO}_4)_3$.	By adding a neutral solution of alumina to a solution of sodium phosphate, and collecting the gelatinous precipitate.
Aluminum Phosphate.	

ALUMEN. U. S. Alum.

[POTASSIUM ALUM. ALUMINUM AND POTASSIUM SULPHATE.]

Preparation.—This valuable salt is made principally from alum-clay, which is chiefly aluminum silicate, by treating it with sulphuric acid, thereby forming aluminum sulphate. Potassium sulphate is then

added, when the double salt $K_2Al_2(SO_4)_4$ is produced. It crystallizes with twenty-four molecules of water. Ammonia-alum, $(NH_4)_2Al_2(SO_4)_6$, is generally found in the market, because of its greater cheapness.

Alumen. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Warm Glycerin.
Large, colorless, octohedral crystals, sometimes modified by cubes, or in crystalline fragments, which, on exposure to air, are liable to absorb ammonia and acquire a whitish coating. When gradually heated, the salt loses water; at 92° C. (197.6° F.) it melts, and if heat be gradually increased to 200° C. (392° F.), it loses 45.52 per cent. of its weight (all of its water of crystallization), leaving a bulky, white residue.	Odorless; sweetish and strongly astringent taste; acid reaction.	At 15° C. (59° F.), 9 parts. Boiling, 0.3 part.	Insoluble.	Freely soluble.
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.	
With solution of potassa or of soda, Alum yields a white precipitate which is completely soluble in an excess of the alkali, no odor of ammonia being evolved (difference from, and absence of, ammonia alum). The aqueous solution also yields, with barium chloride T.S., a white precipitate, insoluble in hydrochloric acid. Ammonia water produces a bulky, white precipitate, which is nearly insoluble in an excess of ammonia. When a saturated solution of the salt is actively shaken with tartaric acid, it affords, within half an hour, a white, crystalline precipitate.		Copper, Zinc, or Lead. Iron	A 5-per-cent. aqueous solution of the salt should not be affected by hydrogen sulphide T.S. 20 C.c. of a 5-per-cent. solution should not at once assume a blue color on the addition of 5 drops of potassium ferrocyanide T.S.	

Uses.—Alum is a powerful astringent. When powdered, it is used as an emetic in croup, in doses of a teaspoonful. It is sometimes used as a local styptic, and is frequently employed in making astringent lotions and injections.

ALUMEN EXSICCATUM. U. S. Dried Alum.

[ALUMEN USTUM. BURNT ALUM.]

	Metric.	Old form.
Alum, in small pieces	100 Gm.	80 oz. av.
To make	55 Gm.	16 oz. av.

Place the Alum in a shallow porcelain capsule so as to form a thin layer, and heat it on a sand-bath until it liquefies. Then continue the application of a moderate heat, with constant stirring, until aqueous vapor ceases to be disengaged, and a dry, white, porous mass is obtained, weighing 55 Gm. [old form 16 oz. av.]. When cold, reduce the product to a fine powder, and preserve it in well-stoppered bottles.

This preparation represents alum nearly deprived of its water of crystallization: the latter exists in alum in the enormous proportion of nearly 45 per cent., thus constituting almost half of its weight.

Dried alum is officially described as a white, granular powder, attracting moisture when exposed to the air, odorless, having a sweetish, astringent taste, very slowly but completely soluble in 20 parts of water

at 15° C. (59° F.), and quickly soluble in 0.7 part of boiling water. It answers to the same reactions as Alum. (See Alumen.) Before pulverization, it is a light, white, opaque, porous mass.

Uses.—It is used as an escharotic. It is more powerful than alum, although not so soluble.

ALUMINI HYDRAS. U. S. Aluminum Hydrate.

[ALUMINUM HYDROXIDE. HYDRATED ALUMINA.]

	Metric.	Old form.
Alum	100 Gm.	16 oz. av.
Sodium Carbonate	100 Gm.	16 oz. av.
Distilled Water, a sufficient quantity.		

Dissolve each salt separately in 1000 C.c. [old form 10 pints] of Distilled Water, filter each solution, and heat it to boiling. Then, having poured the hot solution of Sodium Carbonate into a capacious vessel, gradually pour in the hot solution of Alum with constant stirring, and add an equal volume of boiling Distilled Water. Let the precipitate subside, decant the clear liquid, and pour upon the precipitate 2000 C.c. [old form 20 pints] of hot Distilled Water. Again decant, transfer the precipitate to a strainer, and wash it with hot Distilled Water, until the washings produce not more than a faint cloudiness with barium chloride T.S. Then allow it to drain, dry it at a temperature not exceeding 40° C. (104° F.), and reduce it to a uniformly fine powder.

The direction to add the alum solution to that of the sodium carbonate is important. If the mixing of the solution is reversed, the precipitated hydrate will be contaminated with the alkaline sulphates, so that it will be much more difficult to separate them.

Alumini Hydras. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, light, amorphous powder, permanent in dry air. When heated to redness, it loses 34.6 per cent. of its weight (water of hydration).	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble without residue in hydrochloric or sulphuric acid; also in solution of potassium or sodium hydrate T.S.

IMPURITIES.

TESTS FOR IMPURITIES.

Iron.	{	A solution of 1 Gm. of Aluminum Hydrate in 20 C.c. of diluted hydrochloric acid should not immediately be colored blue by a drop of potassium ferrocyanide T.S.
Sulphate.		A solution of 1 Gm. of Aluminum Hydrate in 20 C.c. of diluted hydrochloric acid should not give more than a faint cloudiness with barium chloride T.S.
Zinc or Lead.		When Aluminum Hydrate is dissolved in solution of potassa or of soda, it should yield no precipitate with hydrogen sulphide T.S.
Salts of Alkalies.		When Aluminum Hydrate is boiled with 20 parts of water, and filtered, the filtrate should leave not more than a slight residue on evaporation.

Uses.—Aluminum hydrate is a desiccant powder: it is absorbent and antacid. The dose is from two to five grains (0.13 to 0.32 Gm.). Externally, it is used like zinc oxide, by dusting on the inflamed surface.

ALUMINI SULPHAS. U. S. Aluminum Sulphate.

Preparation.—This sulphate may be made by the process formerly official.

Take of Alum, Carbonate of Sodium, each, 4 oz. troy; Sulphuric Acid 1 oz. troy, 150 gr.; Water a sufficient quantity. Dissolve the salts separately, each in 6 fluidounces of boiling water, and pour the solution of the Alum gradually into that of the Carbonate of Sodium; then digest with a gentle heat until the evolution of carbonic acid ceases. Collect upon a filter the precipitate formed, and wash it with water, until the washings are no longer affected by chloride of barium. Next, with the aid of heat, dissolve the precipitate in the Sulphuric Acid, previously diluted with $\frac{1}{2}$ pint of Water, and, having filtered the solution, evaporate it until a pellicle begins to form. Then remove it to a water-bath, and continue the evaporation, with constant stirring, until a dry salt remains. Lastly, preserve this in a well-stopped bottle.

Or the hydrate obtained by the process just noted (page 646) may be dissolved in diluted sulphuric acid, the solution evaporated, and the salt granulated.

Alumini Sulphas, U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A white, crystalline powder, permanent in the air. When gradually heated, the salt melts in its water of crystallization, and at or near 200° C. (392° F.) it loses the whole of it, amounting to 45.7 per cent. of its weight.	Odorless; sweetish and afterwards astringent taste; acid reaction.	Cold, 1.2 parts, with a trifling residue. Boiling, Very soluble.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution of the salt yields, with barium chloride T.S., a white precipitate, insoluble in hydrochloric acid, and with potassium or sodium hydrate T.S. a white, gelatinous precipitate, which is soluble in excess of the alkali, but is again separated by the addition of a sufficient amount of ammonium chloride T.S.	Iron.	20 C.c. of a 5-per-cent. aqueous solution of the salt should not at once assume a blue color on the addition of 5 drops of potassium ferrocyanide T.S. A filtered 10-per-cent. aqueous solution of the salt should not be affected by hydrogen sulphide T.S. A filtered 10-per-cent. aqueous solution of the salt should not become more than faintly opalescent within five minutes after the addition of an equal volume of decinormal sodium hyposulphite V.S. If 1 Gm. of the salt be gently heated with 5 C.c. of potassium or sodium hydrate T.S., the liquid should not evolve the odor of ammonia.
	Copper, Lead, or Zinc.	
	Free Acid.	
	Ammonia.	

Uses.—Aluminum sulphate is antiseptic: it is rarely used internally.

Cerium. Ce; 139.9.

Cerium is a metal occurring in *cerite*, *gadolinite*, etc.; it is of a chocolate-brown color, in masses; it takes fire more easily than magnesium; at ordinary temperatures it oxidizes in a moist atmosphere. Two oxides of cerium are known, Ce_2O_3 , *cerous oxide*, and CeO_2 , *ceric oxide*.

Test for Cerium Compounds.

If sodium hypochlorite be added to a solution of a colorless cerous salt, a red precipitate separates: this dissolves in warm hydrochloric acid, and evolves chlorine.

Official Preparation of Cerium.

Official Name.

Preparation.

Cerii Oxalas By precipitating cerium chloride with oxalic acid.

Unofficial Preparations of Cerium.

Ceroso-cerii Oxidum, Ce_2O_4 .	By igniting cerium oxalate in an open vessel and then collecting the mass.
Ceroso-cerie Oxide.	
Cerii Chloridum, CeCl_3 .	By burning cerium in chlorine gas and then collecting the mass.
Cerium Chloride.	
Cerii Nitras, $\text{Ce}(\text{NO}_3)_2 \cdot 2\text{H}_2\text{O}$.	By dissolving ceroso-cerie oxide in nitric acid in presence of alcohol or some other reducing substance.
Cerium Nitrate.	
Cerii Oxidum, CeO .	By heating cerium oxalate in a current of dry hydrogen perfectly free from air.
Cerium Oxide.	
Cerii Sulphas, $\text{Ce}_2(\text{SO}_4)_3$.	By dissolving ceric oxide in sulphuric acid, and evaporating, then crystallizing.
Cerium Sulphate.	

CERII OXALAS. U. S. Cerium Oxalate.

[CEROUS OXALATE.]

Preparation.—This salt is made by decomposing the silicates in the powdered mineral containing the metal, with strong sulphuric acid, then heating the mass, and subsequently treating it with nitric and hydrosulphuric acids to separate contaminating metals. Hydrochloric acid is now added in small quantity, and the cerium compounds are precipitated by oxalic acid. This oxalate is impure, containing lanthanum and didymium compounds: it is therefore mixed with magnesium carbonate, and the mixture heated to redness to decompose the oxalates; the residue is dissolved in a small quantity of nitric acid, and the solution added to water containing a little sulphuric acid; ceric sulphate is produced, which is dissolved in sulphuric acid, and sodium hyposulphite added to reduce it to cerous sulphate; this is collected and treated with oxalic acid, when cerium oxalate precipitates. The complication in the method of preparation of this salt is due to the presence of the two rare metals didymium and lanthanum, which can be separated only with difficulty.

Cerii Oxalas. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, granular powder, permanent in the air. On heating the salt to a dull red heat, a yellowish-red residue of ceric oxide is left (a brown color would indicate the presence of didymium oxide).	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in diluted hydrochloric and sulphuric acid. Insoluble in ether, or in solutions of potassium or sodium hydrate.

TESTS FOR IDENTITY AND QUANTITATIVE TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>On boiling the salt with potassium or sodium hydrate T.S., white, cerous hydrate is left as insoluble residue. Supersaturating a portion of the cold filtrate with acetic acid, and adding calcium chloride T.S., a white precipitate is obtained, soluble in hydrochloric acid, but insoluble in acetic acid. If the yellow residue left after heating be dissolved in concentrated sulphuric acid, and a small crystal of strychnine be added, a deep blue color will appear, which will rapidly change to purple and then to red.</p> <p>From the solution in diluted hydrochloric or sulphuric acid, potassium hydrate T.S. precipitates white, cerous hydrate, which does not redissolve in an excess of the reagent, and gradually turns yellow in contact with air. Ammonium carbonate T.S. precipitates white, cerous carbonate, which is somewhat soluble in excess of the reagent.</p> <p>If 0.1 Gm. of Cerium Oxalate be dissolved in 1 C.c. of sulphuric acid, and 2 C.c. of potassium sulphate T.S. be added, small, colorless crystals of cerium potassium sulphate will be deposited after some time.</p>	<p>Aluminum.</p> <p>Zinc.</p> <p>Carbonate, Arsenic, etc.</p>	<p>A portion of the filtrate obtained by boiling the salt with potassium or sodium hydrate should not yield a precipitate on the addition of an excess of ammonium chloride T.S.</p> <p>A portion of the filtrate obtained by boiling the salt with potassium or sodium hydrate should not yield a precipitate on the addition of ammonium sulphide T.S.</p> <p>On dissolving the salt in hydrochloric acid, no effervescence should occur, and the solution should not be precipitated or rendered turbid by hydrogen sulphide.</p>

Uses.—Cerium oxalate is a valuable remedy in controlling nausea. It is given in doses of two to ten grains (0.12 to 0.6 Gm.).

Cadmium. Cd; 111.5.

This metal is associated with zinc in its ores. Although it enters into *no official preparations*, it is used to some extent in medicine, and hence merits a notice here. It is a white metal, resembling tin, but somewhat heavier and more tenacious. Like that metal, it crackles when bent. Its sp. gr. is 8.7. It is little affected by the air, but when heated combines with an atom of oxygen, forming a reddish-brown or orange-colored oxide, CdO. It combines with chlorine, iodine, bromine, and sulphur.

Tests for Cadmium Salts.

1. Hydrogen sulphide and ammonium sulphide produce precipitates of a yellow color (sulphide) when added to solutions of cadmium salts.
2. Sodium or potassium hydrate produces, with cadmium salts, white precipitates (hydroxide), insoluble in excess. Ammonia water produces similar precipitates, soluble in excess.
3. Sodium or potassium carbonate produces white precipitates of cadmium carbonate, insoluble in excess.

Unofficial Compounds of Cadmium.

Cadmii Bromidum, CdBr ₂ .	By double decomposition between potassium bromide and cadmium sulphate.
Cadmium Bromide.	
Cadmii Chloridum, CdCl ₂ .	By treating cadmium or cadmium carbonate with hydrochloric acid.
Cadmium Chloride.	
Cadmii Iodidum, CdI ₂ .	By double decomposition between potassium iodide and cadmium sulphate.
Cadmium Iodide.	
Cadmii Oxidum, CdO.	By igniting cadmium nitrate or carbonate.
Cadmium Oxide.	
Cadmii Sulphidum, CdS.	By passing hydrogen sulphide through a solution of cadmium chloride, nitrate, or sulphate.
Cadmium Sulphide.	
Cadmii Sulphas, CdSO ₄ .4H ₂ O.	By treating cadmium carbonate or oxide with diluted sulphuric acid.
Cadmium Sulphate.	

QUESTIONS ON CHAPTER XLIII.

ZINC, ALUMINUM, CERIUM, AND CADMIUM.

- Zinc—Give symbol and atomic weight.
 In what form is zinc official?
 How is it made?
 What is its quantivalence?
 What are the tests for zinc salts?
 Describe odor, taste, chemical reaction, and solubility.
 How may the following impurities be detected?—viz.: Arsenic; more than traces of lead, iron, and copper.
 What are its uses?
 Zinc acetate—Give formula in symbols and molecular weight.
 Describe the process (formerly official) by which it may be prepared.
 Describe rationale of the process.
 Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity.
 How may the following impurities be detected?—viz.: Lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.
 For what is it used?
 Zinc bromide—Give formula in symbols and molecular weight.
 How may zinc bromide be made (process of Lyons)?
 In what other way may it be made?
 Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity.
 How may the following impurities be detected?—viz.: Lead or copper, iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.
 What is the dose?
 Precipitated zinc carbonate—Give Latin name, formula in symbols, and molecular weight.
 What is the British process for making this salt? Give rationale of the process.
 Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity.
 How may the following impurities be detected?—viz.: Lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.
 For what is it used?
 Zinc chloride—What is its formula in symbols? What is its molecular weight?
 How is it prepared? Describe rationale of the process.
 Describe odor, taste, chemical reaction, and solubility.
 Give tests for identity.
 How may the following impurities be detected?—viz.: Basic salt, lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.
 For what purposes is it used?
 Solution of zinc chloride—What is the Latin official name? Give formula in symbols and molecular weight.
 How much zinc chloride does it contain?
 How is it prepared?
 How may it be freed from iron which is usually present in the zinc from which it is prepared? Give description and specific gravity.
 What is this solution sometimes called?
 For what is it used?
 Zinc iodide—Give Latin name, formula in symbols, and molecular weight.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.
 What is the dose?
 Zinc oxide—Give Latin name, formula in symbols, and molecular weight.
 What is the process (formerly official) by which it may be made?
 How is it made on the large scale?
 What is the difference between commercial zinc oxide and the official preparation?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Carbonate; lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkalies or of alkaline earths.

For what purposes is it used?

How is zinc oxide ointment made?

Zinc phosphide—Give formula in symbols and molecular weight.

How is it made? Give description and specific gravity.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Lead or copper.

What is the dose?

Zinc sulphate—How is it prepared? Give rationale of the process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Chloride; lead or copper; iron, aluminum, and most of the alkaline earths; salts of alkaline earths or of alkalies. What is the dose?

Zinc valerianate—How is this salt prepared? Give rationale of the process.

What is meant by upward precipitation?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Salts of alkalies and alkaline earths; butyrate. What is the dose?

Aluminum—Give symbol and atomic weight.

Where is this found? Give description and specific gravity.

What is its chemical quantivalence?

What are the salts known as alums?

What are the tests for salts of aluminum?

Alum—Give formula in symbols and molecular weight.

What was the official name of this salt in the U. S. P. 1870?

How is it generally made?

With how many molecules of water does it crystallize?

What kind of alum is generally found in the market?

What is its chemical composition?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Zinc or lead; iron.

What is the dose?

Dried alum—Give its Latin official name.

How much water does alum contain?

Describe odor, taste, chemical reaction, and solubility.

For what is it used?

Aluminum hydrate—Give formula in symbols and molecular weight.

How is it prepared? Describe rationale of the process.

In what manner should the solutions be mixed, and why?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Iron; sulphate; zinc or lead; salts of alkalies. What is the dose?

Aluminum sulphate—Give formula in symbols and molecular weight.

Give the process (formerly official) by which it may be made.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Iron; more than 5 per cent. of sulphates of alkalies. What is it used for?

Cerium—Give symbol and atomic weight.

Where is it found, and what are its physical properties?

What oxides are known, and what is their composition?

What is the test for cerium compounds?

What official preparation is there of cerium?

Cerium oxalate—Give Latin name, formula in symbols, and molecular weight.

How is this salt made?

What two rare metals are usually found in combination with cerium?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Aluminum; zinc; carbonate; metallic impurities. What is the dose?

Cadmium—Give symbol, atomic weight, description, and specific gravity.

Describe odor, taste, and chemical reaction.

What combinations does it form?

What are the tests for cadmium salts?

CHAPTER XLIV.

MANGANESE, IRON, AND CHROMIUM.

Mn; 54.8. Fe; 55.88. Cr.; 52.0.

THESE three metals form a group exhibiting some chemical and physical analogies. They unite with oxygen, producing basic oxides.

Manganese. Mn; 54.

Manganese is found, as a mineral, quite extensively in the state of black oxide, as *pyrolusite*, *braunite*, and *hausmannite*. The carbonate also is sometimes found. The metal is very hard and brittle; when powdered, decomposing water readily. With oxygen it forms five—possibly seven—compounds. The *monoxide*, MnO , is of a light green color, and is the oxide present in or corresponding to manganous salts. The *sesquioxide*, Mn_2O_3 , is black or dark brown, when in the hydrated state; the magnetic oxide, Mn_3O_4 , is red; the dioxide, MnO_2 , is black; and the permanganic oxide, Mn_2O_7 , is, when in the free state, a very unstable dark reddish-brown liquid. The monoxide is a stable base, the sesquioxide feebly basic, and the dioxide when acted upon by acids yields manganous salts, while oxygen is evolved. The highest oxide is acid-forming, yielding permanganic acid, HMnO_4 , the salts of which are known as permanganates. (See Potassii Permanganas, p. 508.) There exists also an acid, H_2MnO_4 (manganic), of which the salts formed are called manganates. The corresponding oxide, however, is not known.

Tests for Salts of Manganese.

1. Ammonium sulphide, added to a solution of a manganese salt, produces a flesh-colored precipitate of manganese sulphide.
2. Potassium or sodium carbonate in solution produces white precipitates, which are insoluble in excess of solution of ammonium carbonate.
3. With the blow-pipe, manganese gives with borax a bead having an amethystine color in the oxidizing flame, and a colorless bead in the deoxidizing flame.
4. If manganese be heated with sodium carbonate, *green* sodium manganate is produced. If this be added to water, it communicates a purplish-red color.

Official Preparations of Manganese.

Official Name.	Preparation.
Mangani Dioxidum	Manganese dioxide, containing at least 66 per cent. of pure oxide.
Mangani Sulphas	Made by treating manganese dioxide with sulphuric acid.
Potassii Permanganas . . .	By heating manganese dioxide, potassium hydrate, and potassium chlorate together.

Unofficial Preparations of Manganese.

Mangani Arsenas, $MnHAsO_4$.

Manganese Arsenate.

Mangani Benzoas.

Manganese Benzoate.

Mangani Carbonas, $MnCO_3$.

Manganese Carbonate.

Mangani Chloridum, $MnCl_2$.

Manganese Chloride.

Mangani Citras.

Manganese Citrate.

Mangani Oxalas, $2MnC_2O_4 \cdot 5H_2O$.

Manganese Oxalate.

Mangani Tarttras.

Manganese Tartrate.

By saturating a solution of arsenic acid with freshly precipitated manganese carbonate.

By adding to a solution of benzoic acid manganese carbonate as long as combination is effected.

By adding to a solution of manganese sulphate a solution of potassium carbonate, and collecting and drying the precipitate.

By treating manganese dioxide with hydrochloric acid, purifying from iron salts, evaporating, and crystallizing.

By digesting manganese carbonate with citric acid, and collecting the precipitate.

By adding to a solution of manganese sulphate a solution of oxalic acid, and collecting the precipitate.

By adding a solution of neutral potassium tartrate to a solution of manganous chloride, and, after the acid tartrate of potassium has deposited, collecting the colorless crystals.

MANGANI DIOXIDUM. U. S. Manganese Dioxide.

[MANGANI OXIDUM NIGRUM, PHARM. 1880. BLACK OXIDE OF MANGANESE.]

Native, crude Manganese Dioxide, containing at least 66 per cent. of the pure Dioxide [MnO_2 ; 86.72].

Black oxide of manganese is frequently found in commerce of poor and variable quality: some pyrolusite from Nova Scotia was examined by the author a few years ago, however, which assayed 96 per cent. of pure oxide. It is the safest rule to buy it only upon assay, and, when a good sample can be found, to secure a large quantity of it.

Mangani Dioxidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A heavy, grayish-black, more or less gritty powder, permanent in the air. It is not affected by cold, concentrated sulphuric acid, but when heated with the latter it is converted into manganous sulphate, with the evolution of oxygen.	Odorless; tasteless.	Insoluble.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>When heated with hydrochloric acid, it is converted into manganous chloride, with the development of chlorine. At a red heat the Dioxide gives off oxygen gas, and is converted into reddish-brown manganoso-manganic oxide (Mn_2O_3). On intimately mixing 1 part of the Dioxide with 1 part of potassium hydrate and 1 part of potassium chlorate, introducing the mass into a crucible, moistening with water, drying, and igniting, a dark fused mass is obtained, which yields, with water, a green solution, changing to purplish-red on being boiled, or on the addition of diluted sulphuric acid.</p> <p>If 1 Gm. of the finely powdered Dioxide, contained in a small, long-necked flask, be mixed with 5 C.c. of water, then 4.22 Gm. of ferrous sulphate, in clear crystals, added, and subsequently 5 C.c. of hydrochloric acid, the mixture digested for about fifteen minutes at a gentle heat, and finally heated to boiling, the cooled filtrate, when immediately tested with freshly prepared potassium ferricyanide T.S., should not acquire a blue color (presence of at least 66 per cent. of pure Manganese Dioxide).</p>	Organic Impurities.	<p>If a portion of the Dioxide be strongly heated in a dry test-tube, no combustion should ensue, nor should any carbon dioxide be evolved.</p> <p>If to another portion of the Dioxide, contained in a test-tube, a small quantity of diluted hydrochloric acid be added, no odor of hydrogen sulphide should be developed, nor should a strip of paper moistened with lead acetate T.S., and suspended over the mixture, become blackened.</p> <p>After the mixture of the Dioxide with hydrochloric acid has been raised to boiling and filtered, the filtered liquid should not give, with hydrogen sulphide T.S., an orange-colored precipitate.</p>
	Metallic Sulphides.	
	Antimony Sulphide.	

Uses.—Manganese dioxide is occasionally used internally, in doses of three to twenty grains (0.19 to 1.3 Gm.). Its principal use is to form the salts of manganese.

MANGANI SULPHAS. U. S. Manganese Sulphate.

Preparation.—This salt is best made by Prof. Diehl's process, by heating manganese dioxide and charcoal together to redness, treating the residue with sulphuric acid, and again heating to redness; the residue is dissolved in water, the solution filtered and crystallized. (See U. S. Dispensatory, 17th ed., p. 849.)

Mangani Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, or pale rose colored, transparent, tetragonal prisms, crystallized at a temperature between 20° and 30° C. (68°–86° F.), and containing 4 molecules, or 32.29 per cent., of water of crystallization. Slightly efflorescent in dry air.	Odorless; slightly bitter and astringent taste; neutral or faintly acid reaction.	At 15° C. (59° F.), 0.8 part. Boiling, 1 part.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution yields, with ammonium sulphide T.S., a flesh-colored precipitate soluble in dilute acids; with potassium ferrocyanide T.S., a reddish-white precipitate; and with potassium ferricyanide T.S., a brown precipitate. With barium chloride T.S. it yields a white precipitate insoluble in hydrochloric acid.</p> <p>If a fragment of the salt be mixed with a little sodium hydrate T.S., and the mixture then dried and fused, it will yield a dark green mass, dissolving in water with a green color.</p> <p>If 1 Gm. of the salt be gently ignited, in a porcelain crucible, it should lose not more than 0.323 Gm. of its weight (distinction from <i>Manganese Sulphate</i> containing a larger amount of water of crystallization).</p>	<p>Iron.</p> <p>Copper or Arsenic.</p> <p>Salts of the Alkalies or of Magnesium.</p> <p>Zinc.</p>	<p>A 5-per-cent. aqueous solution of the salt, after being heated with a few drops of hydrochloric acid and a little chlorine water, should not be colored red by potassium sulphocyanate T.S.,</p> <p>And should not be affected by hydrogen sulphide T.S.</p> <p>If the manganese be completely precipitated from an aqueous solution of the salt by ammonium carbonate T.S., the filtrate, on evaporation and gentle ignition, should leave no residue.</p> <p>A solution of 1 Gm., each, of the salt, and of sodium acetate, in 10 C.c. of water, to which a few drops of acetic acid are added, should not be affected by hydrogen sulphide T.S.</p>

Uses.—Manganese sulphate is used as a tonic, in doses of five to twenty grains (0.3 to 1.3 Gm.).

POTASSII PERMANGANAS. U. S. Potassium Permanganate.

This is the most important official compound of manganese. It is considered under the potassium compounds (page 545).

Iron. Fe; 55.88.

Iron, the most useful and abundant of the metals, is widely diffused in nature: it is found not only in the mineral kingdom, but in animal and vegetable products as well.

Iron is a hard, malleable, ductile, and tenacious metal, of a grayish-white color and fibrous texture, a slightly styptic taste, and a sensible odor when rubbed. Its sp. gr. is 7.8. It is combustible, and, when heated to whiteness, burns in atmospheric air, and with brilliant scintillations in oxygen. At a red heat its surface is converted into black oxide, and at common temperatures, by the combined agency of air and moisture, it becomes covered with a reddish matter, called *rust*, which is hydrated ferric oxide. It combines with all the non-metallic elements except hydrogen and nitrogen, and with most of the metals. It forms three compounds with oxygen,—ferrous and ferric oxide, which, by their union, form the native magnetic oxide, and a tetroxide possessing acid properties, called ferric acid.

Tests for Iron Salts.

1. Potassium *ferrocyanide* produces a nearly white precipitate with a ferrous salt, which rapidly turns blue on exposure to the air; with a ferric salt it strikes a deep blue color (Prussian blue) at once.

2. Potassium *ferricyanide* produces a deep blue color (Turnbull's blue) at once with a ferrous salt, and a greenish or olive color with a ferric salt.

3. Tannin does not change the color of a solution of ferrous salt, provided it has not been oxidized; with a ferric salt a dark greenish-black precipitate (ink) is produced.

4. Ammonium sulphide produces a black precipitate (sulphide) with either a ferrous or a ferric salt.

5. Ammonia water precipitates from ferrous salts, ferrous hydrate, a white precipitate turning green, then black, and finally a brown color; the same reagent precipitates brown ferric hydrate from ferric salts.

Official Preparations of Iron.

Official Name.	Preparation.
Ferrum	Metallic iron in the form of fine, bright, and non-elastic wire.
Ferrum Reductum	Made by passing hydrogen over iron subcarbonate.
Ferri Carbonas Saccharatus	Double decomposition between ferrous sulphate and sodium bicarbonate; the precipitate is preserved with sugar.
Massa Ferri Carbonatis	Double decomposition between ferrous sulphate and sodium carbonate; the precipitate is preserved with honey.
Mistura Ferri Composita.	6 Gm. ferrous sulphate; 18 Gm. myrrh; 18 Gm. sugar; 8 Gm. potassium carbonate; 60 C.c. spirit of lavender; rose water sufficient to make 1000 C.c.
Pilule Ferri Carbonatis	16 Gm. ferrous sulphate; 8 Gm. potassium carbonate; 4 Gm. sugar; 1 Gm. powd. tragacanth; 1 Gm. powd. althæa; glycerin, water, to make 100 pills.
Ferri Chloridum	By acting on iron with hydrochloric acid and crystallizing the solution.
Liquor Ferri Chloridi	By oxidizing solution of ferrous chloride with nitric acid.
Tinctura Ferri Chloridi	250 C.c. of solution of ferric chloride with sufficient alcohol to make 1000 C.c.
Ferri Citras	By evaporating and scaling solution of ferric citrate.
Ferri et Ammonii Citras	By adding ammonia water to solution of ferric citrate, evaporating, and scaling.
Liquor Ferri Citratis	By dissolving ferric hydrate in citric acid.
Vinum Ferri Citratis	40 Gm. iron and ammonium citrate; 150 C.c. tincture of sweet orange peel; 100 C.c. syrup; sufficient white wine to make 1000 C.c.

Official Preparations of Iron.—Continued.

Official Name.	Preparation.
Ferri et Quininæ Citras . . .	By dissolving quinine (alkaloid) in solution of ferric citrate, evaporating, and scaling.
Ferri et Quininæ Citras Solu- bilis	By adding ammonia water to solution of iron and quinine citrate, evaporating, and scaling.
Vinum Ferri Amarum . . .	50 Gm. soluble iron and quinine citrate; 150 C.c. tincture of sweet orange peel; 300 C.c. syrup; sufficient white wine to make 1000 C.c.
Ferri et Strychninæ Citras .	By adding to a solution of iron and ammonium citrate citric acid and strychnine, and scaling.
Syrupus Ferri, Quininæ et Strychninæ Phosphatum .	By dissolving in an acid solution of ferric phosphate quinine, strychnine, and sugar.
Ferri et Ammonii Sulphas .	By dissolving ammonium sulphate in solution of ferric tersulphate, evaporating, and crystallizing.
Ferri et Ammonii Tartras . .	By dissolving ferric hydrate in solution of acid ammonium tartrate, and scaling.
Ferri et Potassii Tartras . . .	By adding to ferric hydrate acid potassium tartrate and a trace of ammonia water, and scaling.
Ferri Hypophosphis	Double decomposition between calcium hypophosphite and ferrous sulphate.
Ferri Iodidum Saccharatum .	By adding solution of ferrous iodide to sugar of milk.
Syrupus Ferri Iodidi	By adding solution of ferrous iodide to sugar.
Pilulæ Ferri Iodidi	4 Gm. reduced iron, 5 Gm. iodine, 4 Gm. glycyrrhiza, 4 Gm. sugar, 1 Gm. ext. glycyrrhiza, 1 Gm. acacia, water q. s., in each pill.
Ferri Lactas	By acting on iron with lactic acid and crystallizing the solution.
Ferri Oxidum Hydratum . . .	By adding ammonia water to solution of ferric tersulphate, and collecting and washing the precipitate.
Ferri Oxidum Hydratum cum Magnesia	By mixing solution of ferric tersulphate with magnesia mixture.
Trochisci Ferri	Each lozenge contains 5 gr. of dried ferric hydrate.
Emplastrum Ferri	90 Gm. ferric hydrate; 50 Gm. olive oil; 140 Gm. Burgundy pitch; 720 Gm. lead plaster.
Ferri Phosphas Solubilis . .	By mixing solutions of ferric citrate and sodium phosphate, evaporating, and scaling.
Ferri Pyrophosphas Solubilis.	By mixing solutions of ferric citrate and sodium pyrophosphate, evaporating, and scaling.
Ferri Sulphas	By treating iron with diluted sulphuric acid, evaporating, and crystallizing.
Ferri Sulphas Exsiccatus . . .	By exsiccating ferrous sulphate at a temperature not above 149° C. (300° F.).
Pilulæ Aloes et Ferri	7 Gm. purified aloes, 7 Gm. dried ferrous sulphate, 7 Gm. aromatic powder, confection of rose q. s., to make 100 pills.
Ferri Sulphas Granulatus . .	By precipitating an aqueous solution of ferrous sulphate with alcohol.
Ferri Valerianas	By double decomposition between ferric sulphate and sodium valerianate.
Liquor Ferri Acetatis	By dissolving ferric hydrate in glacial acetic acid.
Liquor Ferri et Ammonii Acetatis	20 C.c. tincture ferric chloride; 80 C.c. diluted acetic acid; 200 C.c. solution ammonium acetate; 100 C.c. aromatic elixir; 100 C.c. glycerin; sufficient water to make 1000 C.c.
Liquor Ferri Nitratis	By dissolving ferric hydrate in diluted nitric acid.
Liquor Ferri Subsulphatis . .	By heating ferrous sulphate in a mixture of sulphuric and nitric acids.
Liquor Ferri Tersulphatis . .	By heating ferrous sulphate in a mixture of nitric acid with excess of sulphuric acid.

Unofficial Salts of Iron.

Ferri Acetas, $\text{Fe}_2(\text{C}_2\text{H}_3\text{O}_2)_6$. Ferric Acetate.	By dissolving ferric hydrate in acetic acid, evaporating, then crystallizing.
Ferri Arsenas, $3\text{Fe}(\text{FeO})\text{AsO}_4 \cdot 16\text{H}_2\text{O}$. Ferric Arsenate.	By dissolving 1 oz. sodium arsenate and $\frac{1}{2}$ oz. sodium acetate in 8 oz. water, then dissolving 2 oz. ferrous sulphate in 10 fl. oz. water, mixing both solutions, collecting the precipitate, washing, and drying.
Ferri Benzoeas, $\text{Fe}_26\text{C}_7\text{H}_5\text{O}_2 \cdot 6\text{H}_2\text{O}$. Ferric Benzoate.	By adding to a solution of normal ferric sulphate a concentrated solution of sodium benzoate, collecting the precipitate, washing, and drying.
Ferri Bromidum, FeBr_3 . Ferrous Bromide.	By adding 2 p. bromine to 1 p. iron filings and 10 p. water, digesting until the liquid assumes a greenish color, then filtering and evaporating to dryness.
Ferri et Sodii Pyrophosphas. Iron and Sodium Pyrophosphate.	By adding to a solution of 50 p. sodium pyrophosphate in 100 p. water sufficient ferric chloride in aqueous solution so that a permanent precipitate is not produced, then adding 250 p. alcohol and collecting the precipitate.
Ferri Ferrocyanidum, $\text{Fe}_4(\text{FeCN}_6)_3$. Iron Ferrocyanide.	By dissolving $4\frac{1}{2}$ oz. potassium ferrocyanide in 1 pint water, adding the solution to 8 fl. oz. solution of normal ferric sulphate diluted previously with 8 fl. oz. water, stirring continually, collecting the precipitate, washing, and drying.
Ferri Nitras, $\text{Fe}_2(\text{NO}_3)_6$. Ferric Nitrate.	By concentrating a solution of ferric nitrate, filtering, and allowing to crystallize.
Ferri Oxalas. Ferrous Oxalate.	By mixing solutions of ferrous sulphate and oxalic acid and collecting the precipitate.
Ferri Oxidum Magneticum, Fe_3O_4 . Magnetic Iron Oxide.	By dissolving 2 oz. ferrous sulphate in 2 pints water and adding $5\frac{1}{2}$ fl. oz. solution of normal ferric sulphate, then mixing this with 4 pints solution of soda, stirring well, boiling, letting it stand for 2 hours, occasionally stirring, collecting the precipitate, washing, and drying carefully.
Ferri Oxidum Rubrum. Red Oxide of Iron.	By igniting ferrous sulphate in contact with air.
Ferri Phosphas Albus, $\text{Fe}_22\text{PO}_4 \cdot 4\text{H}_2\text{O}$. Ferric Phosphate.	By mixing 4 fl. oz. solution of normal ferric sulphate with a solution of 1 oz. sodium acetate, then adding solution of sodium phosphate, collecting the precipitate, washing, and drying.
Ferri Salicylas. Ferric Salicylate.	By mixing a solution containing 24 grains of ferrous sulphate and 20 grains of sodium acetate in half a fluidounce of water with a solution made by dissolving 30 grains of sodium salicylate in half a fluidounce of water. Dose, a teaspoonful.
Ferri Subcarbonas. Ferric Oxyhydrate.	By mixing solutions of 8 oz. ferrous sulphate and 9 oz. sodium carbonate, collecting the precipitate, washing, and drying without heat.
Ferri Sulphidum, FeS . Ferrous Sulphide.	By mixing 3 p. iron filings with 2 p. sublimed sulphur, then placing in small portions the above mixture into a crucible heated to redness, and keeping covered after each addition.

FERRUM. U S. Iron.

Fe; 55.88.

Metallic Iron, in the form of fine, bright, non-elastic wire.

Iron, when employed in pharmaceutical operations, should be of the purest kind: hence the Pharmacopœias generally direct it, when wanted in small masses, to be in the form of *iron wire*, which is necessarily made from the purest, because the softest and most ductile, iron, and is readily cut into pieces. Such wire is very flexible and without elasticity.

The wire clippings and the ends of card-teeth obtained from the manufacturers of cotton-cards are frequently used in Philadelphia for making iron preparations. They are very convenient; and it may be incidentally mentioned that they are sometimes used as a substitute for sand, in sand-baths.

FERRUM REDUCTUM. U. S. Reduced Iron.

Preparation.—Reduced iron may be made by a process originally proposed by Prof. Procter, and afterwards made official in 1870 :

Take of Subcarbonate of Iron 30 oz. troy. Wash the Subcarbonate thoroughly with water until no traces of sulphate of sodium are indicated by the appropriate tests, and calcine it in a shallow vessel until free from moisture. Then spread it upon a tray, made by bending an oblong piece of sheet-iron in the form of an incomplete cylinder, and introduce this into a wrought-iron reduction-tube, about four inches in diameter. Place the reduction-tube in a charcoal furnace, and, by means of a self-regulating generator of hydrogen, pass through it a stream of that gas, previously purified by bubbling successively through solution of subacetate of lead, diluted with three times its volume of water, and through milk of lime, severally contained in four-pint bottles about one-third filled. Connect with the further extremity of the reduction-tube a lead tube bent so as to dip into water. Make all the junctions air-tight by appropriate lutes ; and, when the hydrogen has passed long enough to fill the whole of the apparatus to the exclusion of atmospheric air, light the fire, and bring that part of the reduction-tube, occupied by the Subcarbonate, to a dull-red heat, which must be kept up so long as the bubbles of hydrogen, breaking from the water covering the orifice of the lead tube, are accompanied by visible aqueous vapor. When the reduction is completed, remove the fire, and allow the whole to cool to the ordinary temperature, keeping up, during the refrigeration, a moderate current of hydrogen through the apparatus. Withdraw the product from the reduction-tube, and, should any portion of it be black instead of iron-gray, separate such portion for use in a subsequent operation. Lastly, having powdered the Reduced Iron, keep it in a well-stopped bottle. When thirty troyounces of Subcarbonate of Iron are operated on, the process occupies from five to eight hours.

The subcarbonate directed in the above formula is, more correctly, a ferric oxyhydrate, and the hydrogen combines with the oxygen to form water, metallic iron, in fine powder, being left.

Ferrum Reductum. U. S.	TEST FOR IMPURITIES.
<p>A very fine, grayish-black, lustreless powder, permanent in dry air, without odor or taste, and insoluble in water or alcohol. When ignited in contact with air it glows, and is converted into black ferroso-ferric oxide. When treated with diluted sulphuric acid, it causes the evolution of nearly odorless hydrogen gas, which should not affect paper moistened with lead acetate T.S. (absence of <i>sulphide</i>), and, on being warmed, it is nearly dissolved without leaving more than 1 per cent. of residuc. Neutral reaction.</p>	<p>If 0.5 Gm. of Reduced Iron be added to 5 C.c. of arsenic-free hydrochloric acid, and the mixture be poured upon a filter while still effervescing, 1 C.c. of the clear filtrate should, after the addition of 2 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorff's Test for Arsenic), together with a small piece of pure tin-foil, and gently heating, show no brown coloration within half an hour (limit of <i>arsenic</i>).</p>

Estimation of the Metallic Iron.—Introduce 0.56 (0.559) Gm. of Reduced Iron into a glass-stoppered bottle, add 50 C.c. of mercuric chloride T.S., and heat the bottle, well stoppered, during one hour on a water-bath, frequently agitating. Then allow it to cool, dilute the contents with water to the volume of 100 C.c., and filter. To 10 C.c. of the filtrate, contained in a glass-stoppered bottle (having a capacity of about 100 C.c.), add 10 C.c. of diluted sulphuric acid, and subsequently decinormal potassium permanganate V.S., until a permanent red color is produced. The number of C.c. of the volumetric solution required, when multiplied by *ten*, will indicate the percentage of metallic iron.

To confirm the assay, decolorize the liquid by a few drops of alcohol, then add 1 Gm. of potassium iodide, and digest for half an hour at a temperature of 40° C. (104° F.). The cooled solution, mixed with a few drops of starch T.S., should require not less than 8 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color (each C.c. of the volumetric solution indicating 10 per cent. of metallic iron).

Uses.—Powder of iron, or reduced iron, is one of the best of the chalybeate tonics. It is generally given in pill form, in doses of three to six grains (0.19 to 0.38 Gm.). An elegant form of administering it is combined with chocolate in the form of lozenges.

FERRI CARBONAS SACCHARATUS. U.S. Saccharated Ferrous Carbonate.

	Metric.	Old form.
Ferrous Sulphate	50 Gm.	5 oz. av.
Sodium Bicarbonate	35 Gm.	3½ oz. av.
Sugar, in fine powder,		
Distilled Water, each, a sufficient quantity,		
To make	100 Gm.	10 oz. av.

Dissolve the Ferrous Sulphate in 200 C.c. [old form 20 fl. oz.] of hot Distilled Water, and the Sodium Bicarbonate in 500 C.c. [old form 50 fl. oz.] of Distilled Water at a temperature not exceeding 50° C. (122° F.), and filter the solutions separately. To the solution of Sodium Bicarbonate contained in a flask having a capacity of about 1000 C.c. [old form 6 pints] add, gradually, the solution of Ferrous Sulphate, and mix thoroughly by rotating the flask. Fill up the flask with boiling Distilled Water, cork it loosely, and set the mixture aside. When the precipitate has subsided, draw off the clear, supernatant liquid by means of a siphon, and then fill the flask again with hot Distilled Water, and shake it. Again draw off the clear liquid, and repeat the washing with hot Distilled Water in the same manner until the decanted liquid gives not more than a slight cloudiness with barium chloride test-solution. Finally drain the precipitate thoroughly on a muslin strainer, transfer it to a porcelain capsule containing 80 Gm. [old form 8 oz. av.] of Sugar, and mix intimately. Evaporate the mixture to dryness, by means of a water-bath, reduce it to powder, and mix intimately with it, if necessary, enough well-dried Sugar to make the final product weigh 100 Gm. [old form 10 oz. av.].

Keep the product in small, well-stoppered bottles.

In this preparation ferrous carbonate is formed, sodium sulphate remaining in solution. Sodium bicarbonate is preferred because the evolution of carbonic acid during the decomposition measurably prevents oxidation: it would have been an improvement to use syrup in the solutions to protect them still further.

The object of boiling the water that is used in washing is to expel the air, so that the ferrous carbonate may escape its oxidizing action; the evaporation of the mixture should be conducted as rapidly as possible, for the same reason.

Ferri Carbonas Saccharatus. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Other Solvents.
A greenish-brown powder, gradually oxidized by contact with air, but completely soluble, with copious evolution of carbonic acid gas, in diluted hydrochloric acid, forming a clear, yellow liquid.	Odorless; at first a sweetish, afterwards a slightly ferruginous taste; neutral reaction.	Partially soluble.	Completely soluble, with copious evolution of carbonic acid gas, in diluted hydrochloric acid, forming a clear, yellow liquid.
QUANTITATIVE TEST.	IMPURITIES.	TEST FOR IMPURITIES.	
If 1.16 (1.1573) Gm. of Saccharated Ferrous Carbonate be dissolved in 10 C.c. of diluted sulphuric acid, and the solution diluted with water to about 100 C.c., it should require about 15 C.c. of decinormal potassium permanganate V.S. to impart a permanent pink tint to the liquid, corresponding to about 15 per cent. of ferrous carbonate (each C.c. of the volumetric solution indicating 1 per cent. of pure Ferrous Carbonate).	Sulphate.	{ If 1 Gm. of Saccharated Ferrous Carbonate be dissolved in 5 C.c. of hydrochloric acid, and the solution diluted with water to the measure of 50 C.c., portions of this solution will afford a blue precipitate with both potassium ferrocyanide T.S. and potassium ferricyanide T.S., but should not be affected by barium chloride T.S.	

Uses.—Saccharated ferrous carbonate is used as a tonic, in doses of five to thirty grains (0.3 to 1.9 Gm.).

MASSA FERRI CARBONATIS. U.S. Mass of Ferrous Carbonate.

[VALLET'S MASS.]

	Metric.	Old form.
Ferrous Sulphate, in clear crystals	100 Gm.	8 oz. av.
Sodium Carbonate	100 Gm.	8 oz. av.
Clarified Honey	38 Gm.	3 oz. av.
Sugar, in coarse powder	25 Gm.	2 oz. av.
Syrup,		
Distilled Water, each, a sufficient quantity,		
To make	100 Gm.	8 oz. av.

Dissolve the Ferrous Sulphate and the Sodium Carbonate, each separately, in 200 C.c. [old form 1 pint] of boiling Distilled Water, and, having added 20 C.c. [old form 1½ fl. oz.] of Syrup to the solution of the Iron salt, filter both solutions, and allow them to become cold. Introduce the solution of Sodium Carbonate into a bottle having a capacity of about 500 C.c. [old form 3 pints], and gradually add the solution of the Iron salt, rotating the flask constantly or fre-

quently, until carbonic acid gas no longer escapes. Add a sufficient quantity of Distilled Water to fill the bottle; then cork the bottle and set it aside, so that the ferrous carbonate may subside. Pour off the supernatant liquid, and, having mixed Syrup and Distilled Water in the proportion of one volume of Syrup to nineteen volumes of Distilled Water, wash the precipitate with the mixture by decantation until the washings no longer have a saline taste. Drain the precipitate on a muslin strainer, and express as much of the Water as possible. Lastly, mix the precipitate at once with the Honey and Sugar, and, by means of a water-bath, evaporate the mixture in a tared capsule, with constant stirring, until it is reduced to 10 Gm. [old form 8 oz. av.].

This preparation consists of ferrous carbonate preserved from oxidation by contact with syrup and honey. The reaction is as follows:

Uses.—Mass of ferrous carbonate is widely known as *Vallet's mass*: it is a valuable chalybeate tonic, and is administered in pill form, in doses of five to fifteen grains (0.3 to 0.9 Gm.).

MISTURA FERRI COMPOSITA. U. S. Compound Iron Mixture.

This mixture depends for its usefulness upon the ferrous carbonate produced by double decomposition between ferrous sulphate and potassium carbonate. The myrrh, sugar, spirit of lavender, and rose water are used as adjuvants and diluents (see p. 317).

PILULÆ FERRI CARBONATIS. U. S. Pills of Ferrous Carbonate.

Each pill contains $2\frac{1}{2}$ gr. of ferrous sulphate, $1\frac{1}{2}$ gr. of potassium carbonate, $\frac{1}{4}$ gr. of sugar, with sufficient tragacanth, althæa, glycerin, and water to form a mass. When the pill reaches the fluids in the stomach, ferrous carbonate is produced through the reaction between the ferrous sulphate and the sodium carbonate.

FERRI CHLORIDUM. U. S. Ferric Chloride.

	Metric.	Old form.
Iron, in the form of fine, bright wire, and cut into small pieces	15 Gm.	2 oz. av.
Hydrochloric Acid,		
Nitric Acid,		
Distilled Water, each, a sufficient quantity.		

Introduce the Iron wire into a flask having a capacity of about 200 C.c. [old form 2 pints], pour upon it 54 Gm. [old form 6 fl. oz.] Hydrochloric Acid, previously diluted with 25 C.c. [old form 3 fl. oz.] of Distilled Water, and let the mixture stand in a moderately warm place until effervescence ceases; then heat it to the boiling point, filter it through paper, and, having rinsed the flask and Iron wire with a little hot Distilled Water, pass the rinsings through the filter. To the filtered liquid add 28 Gm. [old form $3\frac{1}{8}$ fl. oz.] of Hydrochloric Acid, add the mixture, slowly and gradually, in a stream, to 8 Gm. [old form 6 fl. dr.] of Nitric Acid, contained in a capacious porcelain

vessel, and warm gently. After effervescence ceases, apply heat, by means of a sand-bath, until the liquid is free from nitrous odor. Then test a few drops of the liquid, diluted with water, with freshly prepared potassium ferricyanide test-solution. Should this reagent produce a blue color, add a little more Nitric Acid, drop by drop, as long as effervescence is observed, and evaporate off the excess. Then add 5 Gm. [old form 4 fl. dr.] of Hydrochloric Acid, and enough Distilled Water to make the whole weigh 60 Gm. [old form 8 oz. av.], and set this aside, covered with glass, until it forms a solid crystalline mass. Lastly, break the salt into pieces, and keep it in a glass-stoppered bottle, protected from light.

Ferrous chloride is converted into ferric chloride by the addition of nitric and hydrochloric acids; thus,—

Ferri Chloridum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Orange-yellow, crystalline pieces, very deliquescent in moist air. At 35.5° C. (96° F.) the salt melts, forming a reddish-brown liquid. When strongly heated, it decomposes with the loss of water and hydrochloric acid, while the anhydrous salt sublimes, leaving a residue of ferric oxide.	Odorless, or having a faint odor of hydrochloric acid; strongly styptic taste; acid reaction.	Freely and wholly soluble.	Freely and wholly soluble.	Freely and wholly soluble in 1 part of ether and 3 parts of alcohol.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The dilute, aqueous solution yields a brownish-red precipitate with ammonia water, a blue one with potassium ferrocyanide T.S., and a white one, insoluble in nitric acid, with silver nitrate T.S.</p> <p>If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 10 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture kept for half an hour at a temperature of 40° C. (104° F.), and then allowed to cool, it should, after the addition of a few drops of starch T.S., require 20 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>	Zinc and Copper.	<p>If the iron be completely precipitated from a solution of the salt by an excess of ammonia water, the filtrate should be colorless, and should not yield either a white or a dark-colored precipitate with hydrogen sulphide T.S.</p> <p>A solution of the salt should not leave a fixed residue on evaporation and gentle ignition.</p> <p>On adding a clear crystal of ferrous sulphate to a cooled mixture of equal volumes of concentrated sulphuric acid and a moderately dilute solution of the salt, the crystal should not become colored brown, nor should there be a brownish-black color developed around it.</p> <p>A few drops of a solution of the salt, added to freshly prepared potassium ferricyanide, should impart to the latter a pure brown color without a tinge of blue.</p> <p>A 1-per-cent. solution of the salt, in distilled water, when boiled in a test-tube, should remain clear.</p>
	Salts of Fixed Alkalies.	
	Nitric Acid.	
	Ferrous Salt.	
	Oxychloride.	

Uses.—Ferric chloride is used externally as a styptic, and internally as a chalybeate tonic, in doses of three to five grains (0.19 to 0.32 Gm.).

LIQUOR FERRI CHLORIDI. U. S. Solution of Ferric Chloride.

An aqueous solution of Ferric Chloride [$\text{Fe}_2\text{Cl}_6 = 323.98$], containing about 87.8 per cent. of the anhydrous salt, corresponding to 62.9 per cent. of the crystallized salt [$\text{Fe}_2\text{Cl}_6 + 12\text{H}_2\text{O} = 539.5$], or to about 18 per cent. of metallic iron.

	Metric.	Old form.
Iron, in the form of fine, bright wire, and cut into small pieces	150 Gm.	3½ oz. av.
Hydrochloric Acid	870 Gm.	17 fl. oz.
Nitric Acid,		
Distilled Water, each, a sufficient quantity,		
To make	1000 Gm.	1 pint.

Introduce the Iron Wire into a flask having a capacity of about 2000 C.c. [old form 3 pints], pour upon it a mixture of 540 Gm. [old form 10½ fl. oz.] of Hydrochloric Acid and 250 C.c. [old form 5½ fl. oz.] of Distilled Water, and let the mixture stand in a moderately warm place until effervescence ceases; then heat it to the boiling point, filter it through paper, and, having rinsed the flask and Iron Wire with a little hot Distilled Water, pass the rinsings through the filter. To the filtered liquid add 280 Gm. [old form 5½ fl. oz.] of Hydrochloric Acid, add the mixture slowly and gradually, in a stream, to 80 Gm. [old form 1 fl. oz. 3 fl. dr.] of Nitric Acid contained in a capacious porcelain vessel, and warm gently. After effervescence ceases, apply heat, by means of a sand-bath, until the liquid is free from nitrous odor. Then test a few drops of the liquid, diluted with water, with freshly prepared potassium ferricyanide test-solution. Should this reagent produce a blue color, add a little more Nitric Acid, drop by drop, as long as effervescence is observed, and evaporate off the excess. Finally, add the remaining 50 Gm. [old form 1 fl. oz.] of Hydrochloric Acid and enough Distilled Water to make the solution weigh 1000 Gm. [old form 1 pint].

The reaction which takes place here is exactly the same as that in ferric chloride, which has been described on page 662; the processes being identical with one exception, that the solution is crystallized to make the salt. If this solution, when finished, has a blackish color, it is due to incomplete oxidation, and the remedy is to heat it to boiling in a capacious dish, adding a few drops of nitric acid until the color changes to a clear ruby-red and effervescence ceases. If a brown precipitate is deposited upon dilution or standing, deficiency of hydrochloric acid is indicated, and the solution must be heated, and a few drops of the acid added until the precipitate is dissolved.

Liquor Ferri Chloridi. U. S.	ODOR, TASTE, AND REACTION.
A reddish-brown liquid. Specific gravity about 1.387 at 15° C. (59° F.).	Faint odor of hydrochloric acid; acid, strongly styptic taste; acid reaction.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The diluted Solution affords a brownish-red precipitate with ammonia water, a blue one with potassium ferrocyanide T.S., and a white one, insoluble in nitric acid, with silver nitrate T.S.</p> <p>If 1.12 (1.1176) Gm. of the Solution be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T.S., it should require about 26 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 0.5 per cent. of metallic iron).</p>	<p>Zinc, Copper.</p> <p>Salts of the Fixed Alkalies.</p> <p>Nitric Acid.</p> <p>Ferrous Salt.</p> <p>Oxychloride.</p>	<p>If the iron be completely precipitated from a portion of the Solution by excess of ammonia water, the filtrate should be colorless, and should not yield either a white or a dark-colored precipitate with hydrogen sulphide T.S.</p> <p>The Solution, after the iron has been completely precipitated from it by an excess of ammonia water, should leave no fixed residue on evaporation and gentle ignition.</p> <p>On adding a clear crystal of ferrous sulphate to a cooled mixture of equal volumes of concentrated sulphuric acid and a moderately dilute portion of the Solution, the crystal should not become colored brown, nor should there be a brownish-black color developed around it.</p> <p>A few drops added to freshly prepared potassium ferriocyanide T.S. should impart to it a pure brown color without a trace of green or greenish-blue.</p> <p>On diluting 1 C.c. of the Solution, with water, to 40 C.c., and boiling, the liquid should remain clear.</p>

Uses.—This solution is occasionally used as a hæmostatic: its principal use, however, is to form, by dilution with alcohol, the well-known tincture of ferric chloride.

TINCTURA FERRI CHLORIDI. U. S. Tincture of Ferric Chloride.

This tincture is made by diluting 250 C.c. of solution of ferric chloride with 750 C.c. of alcohol, the mixture to stand in a closely-covered vessel at least three months: it is then to be transferred to glass-stoppered bottles (see page 367). The object of allowing the mixture to stand three months before it is to be used is to permit the formation of ethyl chloride and other similar ethereal compounds, the result of the action of the free acid on the alcohol. These ethers are supposed to give to the tincture diuretic properties. If a brownish-red precipitate of ferric oxychloride takes place upon diluting the solution of ferric chloride, it shows that the solution has not been made properly and is deficient in free hydrochloric acid (see above).

Uses.—Tincture of ferric chloride is undoubtedly the most important liquid iron preparation that is used: it is an efficient chalybeate, tonic, and styptic. The dose is from ten to thirty minims (0.6 to 1.8 C.c.), diluted with water: it should be sucked through a glass tube, to prevent injury to the teeth.

FERRI CITRAS. U. S. Ferric Citrate.

Solution of Ferric Citrate, a convenient quantity.

Evaporate the Solution on a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in well-stoppered bottles, protected from light.

Ferri Citras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, transparent, garnet-red scales, permanent in the air.	Odorless; very faint ferruginous taste; acid reaction.	Cold, Slowly but completely soluble.	Insoluble.
		Boiling, Readily soluble, but diminishing in solubility by age.	

TESTS FOR IDENTITY, ETC.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution of the salt is not precipitated, but is rendered darker, by ammonia water. If heated with potassium or sodium hydrate T.S., it affords a brown-red precipitate, without evolving any vapor of ammonia. On adding potassium ferrocyanide T.S. to an aqueous solution of the salt, a bluish-green color or precipitate is produced, which is increased and rendered dark blue by the subsequent addition of hydrochloric acid (difference from iron and ammonium citrate).</p> <p>If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, with the aid of a gentle heat, and, after the addition of 1 Gm. of potassium iodide, the mixture kept for half an hour at a temperature of 40° C. (104° F.) and then allowed to cool, and mixed with a few drops of starch T.S., it should require about 16 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>	<p>Citrates or Tartrates of the Fixed Alkalies.</p> <p>Tartrate.</p>	<p>When strongly heated, the salt chars, and finally leaves a residue of ferric oxide, which should not have an alkaline reaction upon litmus paper.</p> <p>If a 10-per-cent. solution of the salt be deprived of its iron by boiling with an excess of potassium or sodium hydrate T.S., and the filtrate be slightly acidulated with acetic acid, a portion of the cooled liquid, mixed with a little calcium chloride T.S., and again heated to boiling, will gradually afford a white, crystalline precipitate.</p> <p>Another portion of the acidulated and cooled liquid, when allowed to stand for some time, should not afford a white, crystalline precipitate.</p>

Uses.—This salt is *very slowly* soluble in water, and hence is not largely used in making solutions. It is very useful in making pills, its slow solubility being an advantage in preventing the flattening and cohering which usually take place when the more soluble form is used. The dose is five to twenty grains (0.3 to 1.3 Gm.).

FERRI ET AMMONII CITRAS. U.S. Iron and Ammonium Citrate.

	Metric.	Old form.
Solution of Ferric Citrate	100 C.c.	10 fl. oz.
Ammonia Water	40 C.c.	4 fl. oz.

Mix the Solution of Ferric Citrate with the Ammonia Water, evaporate the mixture by means of a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in well-stoppered bottles, protected from light.

Prof. J. U. Lloyd modifies this process with advantage by using, instead of ammonia water, a definite quantity of ammonium citrate in solution (see U.S. Dispensatory, 17th ed., page 607).

Ferri et Ammonii Citras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.

Thin, transparent, garnet-red scales, deliquescent on exposure to damp air.	Odorless; saline, mildly ferruginous taste; neutral reaction.	Readily and wholly soluble.	Insoluble.
TESTS FOR IDENTITY.		IMPURITIES. TESTS FOR IMPURITIES.	
<p>The aqueous solution of the salt is not precipitated, but is rendered darker, by ammonia water. With potassium ferrocyanide T.S. the solution does not give a blue color or precipitate, unless it be acidulated with hydrochloric acid (difference from <i>ferric citrate</i>). If heated with potassium or sodium hydrate T.S., it affords a brownish-red precipitate, and vapor of ammonia is evolved.</p> <p>If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.) and then allowed to cool, and mixed with a few drops of starch T.S., it should require about 16 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>		<p>Citrates or Tartrates of the Fixed Alkalies. { When strongly heated, the salt chars, and finally leaves a residue of ferric oxide, which should not have an alkaline reaction upon litmus paper.</p> <p>If a 10-per-cent. solution of the salt be deprived of its iron by boiling it with an excess of potassium or sodium hydrate T.S., and the filtrate slightly acidulated with acetic acid, a portion of the cooled liquid, mixed with a little calcium chloride T.S., and again heated to boiling, will gradually afford a white, crystalline precipitate.</p> <p>Tartrate. { Another portion of the acidulated and cooled liquid, when allowed to stand for some time, should not afford a white, crystalline precipitate.</p>	

Uses.—Ammonio-ferric citrate is a useful modification of ferric citrate, the object of adding the ammonia water being to make the salt more soluble. The dose is five to twenty grains (0.3 to 1.3 Gm.).

LIQUOR FERRI CITRATIS. U.S. Solution of Ferric Citrate.

An aqueous solution of Ferric Citrate, corresponding to about 7.5 per cent. of metallic iron.

	Metric.	Old form.
Solution of Ferric Sulphate	1050 Gm.	10½ oz. av.
Citric Acid	300 Gm.	8 oz. av.
Ammonia Water	880 C.c.	8½ fl. oz.
Water, a sufficient quantity,		

To make	1000 Gm.	10 oz. av.
-------------------	----------	------------

Mix the Ammonia Water with 3000 C.c. [old form 30 fl. oz.] of cold Water, and the Solution of Ferric Sulphate with 10000 C.c. [old form 6 pints] of cold Water. Add the latter solution slowly to the diluted Ammonia Water, with constant stirring. Pour the mixture on a wet muslin strainer, and allow the liquid to run off and the precipitate to drain. Then remove the moist mass from the strainer, mix it well with 6000 C.c. [old form 3½ pints] of cold Water, again pour it on the strainer, and let it drain. Repeat this washing with several successive portions of cold Water in the same manner, until the

washings cease to produce more than a slight cloudiness with barium chloride test-solution. Then allow the precipitate to drain completely, transfer it to a porcelain capsule, add the Citric Acid, and heat the mixture, on a water-bath, to 60° C. (140° F.), stirring constantly, until the precipitate is dissolved. Lastly, filter the liquid, and evaporate it, at the above-mentioned temperature, until it weighs 1000 Gm. [old form 10 oz. av.].

In this preparation ferric hydrate is precipitated, ammonium sulphate being washed out, and the former is then dissolved in citric acid and the solution brought to a definite strength.

Liquor Ferri Citratis. U.S.	ODOR, TASTE, AND REACTION.
A dark brown liquid. Sp. gr. about 1.250 at 15° C. (59° F.). Upon evaporating 100 Gm. of the Solution, in a thin layer, on plates of glass, about 42.5 to 43 Gm. of garnet-red scales will be obtained.	Odorless; slightly ferruginous taste; acid reaction.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The Solution is not precipitated, but only rendered darker, by ammonia water. With potassium ferrocyanide T.S., it affords a bluish-green color or precipitate, which is increased and rendered dark blue by the subsequent addition of hydrochloric acid. On heating the Solution with potassium or sodium hydrate T.S., it will yield a brown precipitate, without evolving vapor of ammonia.</p> <p>If to another portion of the acidulated and cooled filtrate a little calcium chloride T.S. be added, and the liquid heated to boiling, it should gradually deposit a white crystalline precipitate.</p> <p>If 1.12 (1.1176) Gm. of the Solution be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T.S., it should require about 15 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 0.5 per cent. of metallic iron).</p>	<p>Tartrate.</p>	<p>If a portion of the Solution, diluted with 4 volumes of water, be deprived of its iron by boiling it with an excess of potassium or sodium hydrate T.S., and the filtrate slightly acidulated with acetic acid, a portion of this liquid, when allowed to stand for some time, should not give a white crystalline precipitate.</p>

Uses.—This solution deserves to be known better and used oftener than it has been in the past. It keeps well, and much labor will be saved by the pharmacist if he will use it in all cases where an aqueous solution of ferric citrate is needed. It is of just *half* the strength of the scaled salt, and therefore the use of a double quantity of this solution will be found very convenient.

VINUM FERRI CITRATIS. U. S. Wine of Ferric Citrate.

This preparation, known more frequently as *Wine of Iron*, is made by dissolving 40 Gm. of iron and ammonium citrate in a mixture of 100 C.c. of syrup, 150 C.c. of tincture of sweet orange-peel, and sufficient white wine to make 1000 C.c. It is used as an agreeable chalybeate tonic, in doses of a fluidrachm (3.7 C.c.) (see page 383).

FERRI ET QUININÆ CITRAS. U. S. Iron and Quinine Citrate.

	Metric.	Old form.
Ferric Citrate	85 Gm.	18 oz. av. 262 gr.
Quinine, dried at 100° C. (212° F.) to a constant weight	12 Gm.	1 oz. av. 400 gr.
Citric Acid	3 Gm.	210 grains.
Distilled Water, a sufficient quantity,		
To make	100 Gm.	16 oz. av.

Dissolve the Ferric Citrate in 160 C.c. [old form 26 fl. oz.] of Distilled Water by heating on a water-bath at a temperature not exceeding 60° C. (140° F.). To this solution add the Quinine and Citric Acid, previously triturated with 20 C.c. [old form 3½ fl. oz.] of Distilled Water, and stir constantly until the Quinine and Citric Acid are dissolved. Lastly, evaporate the solution on a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales. Keep the product in well-stoppered bottles, protected from light.

This well-known salt is simply a ferric citrate containing quinine in the proper quantity to make a good medicinal preparation. No chemical formula is officially given to it, for the sufficient reason that it is not regarded as a definite chemical compound. It is often found deficient in quinine, and sometimes with a cheaper alkaloid substituted for it.

It frequently occurs in the market in light-green scales. This color is due to the use of ammonia or ammonium citrate with the view of making the salt more soluble.

The official salt is not intended to be very soluble, the bitter taste being much less perceptible than when ammonia is combined with the citric acid.

Care should be exercised in buying this salt from the manufacturer to specify the U. S. P. salt, as two kinds are sometimes kept for sale.

Ferri et Quinina Citras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Transparent, thin scales, of a reddish-brown color to yellowish-brown, slowly deliquescent in damp air. Slowly but wholly soluble in cold water, more readily soluble in hot water, and but slightly soluble in alcohol. Its solubility is diminished by age.	Odorless; bitter and mildly ferruginous taste; acid reaction.	Cold, Slowly but wholly soluble. Boiling. More readily.	Slightly soluble.

TESTS FOR IDENTITY.	QUANTITATIVE TEST.
<p>On the addition of a solution of the salt with a slight excess of ammonia water, the color of the liquid is deepened, and a white, curdy precipitate is thrown down. A small portion of the filtrate, when mixed with potassium ferrocyanide T.S., does not produce a blue color or precipitate unless it is acidulated with hydrochloric acid. Another portion of the filtrate, treated with an excess of potassium or sodium hydrate T.S., deposits a brownish-red precipitate.</p> <p>If a 10-per-cent. solution of the salt be deprived of its iron and quinine by boiling it with an excess of potassium or sodium hydrate T.S., and the filtrate slightly acidulated with acetic acid, a portion of the cooled liquid, mixed with a little calcium chloride T.S., and again heated to boiling, gradually deposits a white crystalline precipitate.</p> <p>Another portion of the acidulated and cooled liquid, when allowed to stand for some time, should not afford a white crystalline precipitate (absence of <i>tartrate</i>).</p> <p>When strongly heated, the salt chars, and finally leaves a residue of ferric oxide, which should not have an alkaline reaction upon litmus paper (absence of <i>citrates</i> or <i>tartrates</i> of the fixed alkalies).</p>	<p><i>Estimation of the Quinine.</i>—Dissolve 1.12 (1.1176) Gm. of Iron and Quinine Citrate in a capsule, with the aid of a gentle heat, in 20 C.c. of water. Transfer the solution, together with the rinsings of the capsule, to a separator, allow the liquid to become cold, then add 5 C.c. of ammonia water and 10 C.c. of chloroform, and shake. Allow the liquids to separate, draw off the chloroform layer, and shake the residuary liquid a second and a third time with 10 C.c. of chloroform. Allow the combined chloroformic extracts to evaporate spontaneously in a tared capsule, and dry the residue at a temperature of 100° C. (212° F.) to a constant weight. This residue should weigh not less than 0.1288 Gm. (corresponding to at least 11.5 per cent. of dried quinine), and should respond to the reactions and tests of quinine (see <i>Quinine</i>).</p> <p><i>Estimation of the Iron.</i>—Heat the aqueous liquid, from which the quinine has been removed in the manner just described, on a water-bath, until the odor of chloroform and ammonia has disappeared, allow it to cool, and dilute it with water to the volume of 50 C.c. Transfer 25 C.c. of the liquid to a glass-stoppered bottle (having the capacity of about 100 C.c.), add 2 C.c. of hydrochloric acid and 1 Gm. of potassium iodide, and allow the mixture to stand for half an hour at a temperature of 40° C. (104° F.). After it has been allowed to cool, and been mixed with a few drops of starch T.S., it should require about 14.5 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>

Uses.—This is a valuable tonic combination, and is particularly useful in making pills, because of its slow solubility (see *Ferri Citras*). To supply the demand for a more popular salt, the soluble iron and quinine citrate was made official. The dose of the salt is from five to ten grains (0.3 to 0.6 Gm.).

FERRI ET QUININÆ CITRAS SOLUBILIS. U. S. Soluble Iron and Quinine Citrate.

	Metric.	Old form.
Ferric Citrate	85 Gm.	18 oz. av. 262 gr.
Quinine, dried at 100° C. (212° F.) to a constant		
weight	12 Gm.	1 oz. av. 400 gr.
Citric Acid	3 Gm.	210 grains.
Ammonia Water,		
Distilled Water, each, a sufficient quantity,		
To make	100 Gm.	16 oz. av.

Dissolve the Ferric Citrate in 160 C.c. [old form 26 fl. oz.] of Distilled Water, by heating on a water-bath at a temperature not exceeding

60° C. (140° F.). To this solution add the Quinine and Citric Acid previously triturated with 20 C.c. [old form 3½ fl. oz.] of Distilled Water, and stir constantly until the Quinine and Citric Acid are dissolved. Then add gradually, and with constant stirring, 50 C.c. [old form 8 fl. oz.], or a sufficient quantity, of Ammonia Water, so that, after the addition of each portion of the latter, the precipitated Quinine will be redissolved and the liquid acquire a greenish-yellow tint. Lastly, evaporate the solution on a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in well-stoppered bottles, protected from light.

Ferri et Quininae Citras Solubilis. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, transparent scales, of a greenish, golden-yellow color, deliquescent in damp air. On the addition of a slight excess of ammonia water the color of the liquid is deepened, and a white, curdy precipitate is produced. If a portion of the filtrate from this precipitate be mixed with some potassium ferrocyanide T.S., it does not afford a blue color or precipitate, unless it be acidulated with hydrochloric acid. Another portion of the filtrate, treated with an excess of potassium or sodium hydrate T.S., gives a brownish-red precipitate.	Odorless; bitter, mildly ferruginous taste; slightly acid reaction.	Cold, Rapidly and completely.	Cold, Partially.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.

(See test for identity.)</p>	

Uses.—This is the soluble form of iron and quinine citrate, and is preferred by pharmacists when solutions are needed quickly. It differs from the salt considered on page 668 only in containing ammonia.

VINUM FERRI AMARUM. U. S. Bitter Wine of Iron.

This wine is made by dissolving 50 Gm. of soluble iron and quinine citrate in 500 C.c. of white wine, and adding 150 C.c. of tincture of sweet orange-peel, 300 C.c. of syrup, and sufficient white wine to make 1000 C.c. (see page 383). It is used as a mild ferruginous tonic, in doses of two to four teaspoonfuls (7.3 to 14.7 C.c.).

FERRI ET STRYCHNINÆ CITRAS. U. S. Iron and Strychnine Citrate.

	Metric.	Old form.
Iron and Ammonium Citrate	98 Gm.	490 gr.
Strychnine	1 Gm.	5 grains.
Citric Acid	1 Gm.	5 grains.
Distilled Water	120 C.c.	11 fl. dr.
To make	100 Gm.	1 oz. av.

Dissolve the Iron and Ammonium Citrate in 100 C.c. [old form 9 fl. dr.] of Distilled Water, and the Strychnine, together with the Citric Acid, in 20 C.c. [old form 2 fl. dr.] of Distilled Water. Mix the two solutions, evaporate the mixture by means of a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales. Keep the product in well-stoppered bottles, protected from light. This salt contains 1 per cent. of strychnine.

Ferri et Strychninæ Citras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, transparent scales, varying in color from garnet-red to yellowish-brown, deliquescent in damp air.	Odorless; bitter and slightly ferruginous taste; slightly acid reaction.	Readily and wholly soluble.	Slightly soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

On heating the aqueous solution of the salt with potassium or sodium hydrate T.S., a brownish-red precipitate is produced, and vapor of ammonia is evolved. On adding potassium ferrocyanide T.S. to a dilute aqueous solution of the salt, no blue color or precipitate is produced unless the solution is acidulated with hydrochloric acid. If a ten-per cent. solution of the salt be deprived of its iron and strychnine by boiling with an excess of potassium or sodium hydrate T.S., the filtrate slightly acidulated with acetic acid, a portion of the cooled liquid, mixed with a little calcium chloride T.S., and again heated to boiling, will gradually deposit a white, crystalline precipitate. Another portion of the acidulated and cooled liquid, when allowed to stand for some time, should not deposit a white, crystalline precipitate (*absence of tartrate*). When strongly heated, the salt chars, and finally leaves a residue of ferrie oxide, which should not have an alkaline reaction upon litmus paper.

Estimation of the Strychnine.—Dissolve 2.24 (2.2352) Gm. of Iron and Strychnine Citrate, in a separator, in 15 C.c. of water, add 5 C.c. of ammonia water and 10 C.c. of chloroform, and shake. Allow the liquids to separate, draw off the chloroform layer, and shake the residuary liquid a second and a third time with 10 C.c. of chloroform. Allow the combined chloroformic extracts to evaporate spontaneously in a tared capsule, and dry the residue at a temperature of 100° C. (212° F.) to a constant weight. This residue should weigh not less than 0.02 Gm. nor more than 0.0224 Gm. (corresponding to not less than 0.9 nor more than 1 per cent. of strychnine), and should respond to the reactions and tests of strychnine (see *Strychnina*).

Estimation of the Iron.—Heat the aqueous liquid, from which the strychnine has been removed in the manner just described, on a water-bath, until the odor of chloroform and ammonia has disappeared, allow it to cool, and dilute it with water to the volume of 100 C.c. Transfer 25 C.c. of the liquid to a glass-stoppered bottle (having the capacity of about 100 C.c.), add 2 C.c. of hydrochloric acid and 1 Gm. of potassium iodide, and allow the mixture to stand for half an hour, at a temperature of 40° C. (104° F.). After it has been allowed to cool, and been mixed with a few drops of starch T.S., it should require about 16 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).

Uses.—This salt is used as a bitter ferruginous tonic, in doses of three to five grains (0.19 to 0.32 Gm.).

SYRUPUS FERRI, QUININÆ ET STRYCHNINÆ PHOSPHATUM.

U. S. Syrup of Iron, Quinine, and Strychnine Phosphates.

This syrup is made by dissolving 20 Gm. of ferric phosphate, 30 Gm. of quinine sulphate, and 0.2 Gm. of strychnine in 48 C.c. of phosphoric acid, 100 C.c. of glycerin, 50 C.c. of water, and sufficient syrup to make 1000 C.c. (see page 305). It is sometimes known as *Easton's Syrup*. On keeping, it gradually deposits an insoluble precipitate containing a portion of the alkaloids. The dose is one to two teaspoonfuls (3.7 to 7.4 C.c.).

FERRI ET AMMONII SULPHAS. U. S. Ferric Ammonium Sulphate.

[AMMONIO-FERRIC SULPHATE. AMMONIO-FERRIC ALUM.]

Ferric Ammonium Sulphate should be kept in well-stoppered bottles.

Preparation.—Ammonio-ferric alum may be made by the process formerly official :

Take of Solution of Tersulphate of Iron 2 pints, Sulphate of Ammonium 4½ oz. troy. Heat the Solution of Tersulphate of Iron to the boiling point, add the Sulphate of Ammonium, stirring until it is dissolved, and set the liquid aside to crystallize. Wash the crystals quickly with very cold water, wrap them in bibulous paper, and dry them in the open air.

It is well to choose the cold winter weather to prepare this salt, if it is possible to make a choice, as handsome crystals may then be obtained with little labor. This compound is not very stable, melting oftentimes in hot summer weather in its water of crystallization.

Ferri et Ammonii Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Pale violet, octohedral crystals, efflorescent on exposure to air. When strongly heated, the crystals fuse, lose their water of crystallization, swell up, and finally leave a pale brown residue.	Odorless; acid, styp-tic taste; slightly acid reaction.	At 15° C. (59° F.), 3 parts. Boiling, 0.8 part.	Insoluble.

TESTS.	IMPURITIES.	TEST FOR IMPURITIES.
<p>The aqueous solution of the salt yields a blue precipitate with potassium ferrocyanide T.S. With potassium or sodium hydrate T.S., it affords a brownish-red precipitate, and if the mixture be heated, vapor of ammonia is evolved. With barium chloride T.S., it produces a white precipitate insoluble in hydrochloric acid.</p> <p>If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), and then allowed to cool, and mixed with a few drops of starch T.S., it should require not less than 11.6 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>	Aluminum.	<p>If all the iron be precipitated from a solution of the salt by treating with an excess of potassium or sodium hydrate T.S., the resulting filtrate, when neutralized with hydrochloric acid, and then mixed with ammonia water, should not yield a white, gelatinous precipitate.</p>

Uses.—Iron alum is used as a styptic in saturated solution. It partakes more of the characteristics of an alum than of an iron salt.

FERRI ET AMMONII TARTRAS. U. S. Iron and Ammonium Tartrate.

[AMMONIO-FERRIC TARTRATE.]

	Metric.	Old form.
Solution of Ferric Sulphate	100 C.c.	8 fl. oz. 3 fl. dr.
Tartaric Acid	29 Gm.	1 oz. av.
Distilled Water	200 C.c.	7 fl. oz.
Ammonia Water,		
Water, each, a sufficient quantity.		

To 110 C.c. [old form 3 fl. oz. 6 fl. dr.] of Ammonia Water, previously diluted with 250 C.c. [old form 8 fl. oz.] of cold Water, add, with constant stirring, the Solution of Ferric Sulphate, previously diluted with 1300 C.c. [old form 42 fl. oz.] of cold Water. When the precipitate has subsided, draw off the clear, supernatant liquid by means of a siphon, then mix the precipitate intimately with about 1500 C.c. [old form 48 fl. oz.] of cold Water, again draw off the clear liquid, and repeat the washing with Water in the same manner until the decanted liquid gives not more than a slight cloudiness with barium chloride test-solution. Then transfer the precipitate to a wet muslin strainer, allow it to drain, and express the water as completely as possible. Dissolve one-half of the Tartaric Acid in the Distilled Water, neutralize the solution exactly with Ammonia Water, then add the other half of the Tartaric Acid, and dissolve it by the application of a gentle heat. Now add the moist ferric hydrate, in successive portions, stirring constantly, and continue the heat, which should not exceed 60° C. (140° F.), until the hydrate is dissolved. Filter the solution while hot, evaporate it in a porcelain vessel, at or below the above-mentioned temperature, to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales. Keep the product in well-stoppered bottles, protected from light.

Theoretically, this salt is supposed to have the following composition: $2(\text{FeO})\text{NH}_4\text{C}_4\text{H}_4\text{O}_6 \cdot 3\text{H}_2\text{O}$. The formula indicates a double tartrate, in which the two basylous hydrogen atoms have been substituted by one of iron and one of ammonium radical. The scaled salts are, however, not definite compounds.

The object in this process is to form a compound in which ferric hydrate is made soluble by acid ammonium tartrate, and the double salt iron and ammonium tartrate is produced.

Ferri et Ammonii Tartras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, transparent scales, varying in color from garnet-red to reddish-brown, only slightly deliquescent.	Odorless; sweetish and slightly ferruginous taste; neutral reaction.	Very soluble.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TEST FOR IMPURITIES.
<p>The aqueous solution of the salt is not precipitated, but is rendered darker, by ammonia water. If heated with potassium or sodium hydrate T.S., it yields a brownish-red precipitate, and vapor of ammonia is evolved. On adding potassium ferrocyanide to an aqueous solution of the salt, no blue color or precipitate is produced unless the solution is acidulated with hydrochloric acid. If a solution of the salt be deprived of iron by boiling with an excess of solution of soda, the concentrated and cooled filtrate, when supersaturated with acetic acid, will afford a white, crystalline precipitate. If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T.S., it should require about 17 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).</p>	<p>Citrates or Tartrates of the Fixed Alkalies.</p>	<p>When strongly heated, the salt chars, emits fumes having the odor of burnt sugar, and finally leaves a residue of ferric oxide, which should not have an alkaline reaction upon litmus paper.</p>

Uses.—This preparation is a mild chalybeate, the dose being ten to thirty grains (0.6 to 1.9 Gm.).

FERRI ET POTASSII TARTRAS. U. S. Iron and Potassium Tartrate.

[POTASSIO-FERRIC TARTRATE.]

	Metric.	Old form.
Solution of Ferric Sulphate	100 C.c.	3 fl. oz. 3 fl. dr.
Potassium Bitartrate	38 Gm.	1 oz. av. 150 gr.
Distilled Water	300 C.c.	10 fl. oz.
Ammonia Water,		
Water, each, a sufficient quantity.		

To 110 C.c. [old form 3 fl. oz. 6 fl. dr.] of Ammonia Water, previously diluted with 250 C.c. [old form 8 fl. oz.] of cold Water, add, under constant stirring, the Solution of Ferric Sulphate, previously diluted with 1300 C.c. [old form 44 fl. oz.] of cold Water. When the precipitate has subsided, draw off the clear, supernatant liquid by means of a siphon, then mix the precipitate intimately with about 1500 C.c. [old form 50 fl. oz.] of cold Water, again draw off the clear liquid, and repeat the washing with Water in the same manner until the decanted liquid gives not more than a slight cloudiness with barium chloride test-solution. Then transfer the precipitate to a wet muslin strainer, allow it to drain, and express the water as completely as possible. Mix the Potassium Bitartrate with the Distilled Water in a porcelain vessel, heat the mixture, on a water-bath, to a temperature not exceeding 60° C. (140° F.), and gradually add the moist ferric hydrate, stirring constantly until it is dissolved. Filter the liquid while hot, and let the filtrate stand in a cool, dark place for twenty-four hours. Then stir it well with a porcelain or glass spatula, so that the precipitate which has formed in it may be thoroughly incorporated

with the liquid. Now add, very cautiously, just enough Ammonia Water to dissolve the precipitate, evaporate the solution in a porcelain vessel, at or below the above-mentioned temperature, to the consistence of syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in well-stoppered bottles, protected from light.

The intention in making iron and potassium tartrate is to replace the hydrogen in the acid potassium tartrate with iron, so that a double salt is produced like potassium and sodium tartrate.

Ferri et Potassii Tartras. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, transparent, slightly deliquescent scales, varying in color from garnet-red to reddish-brown. When strongly heated, the salt chars, emits fumes having the odor of burnt sugar, and finally leaves a dark brown residue, having a strongly alkaline reaction, and effervescing with acids (distinction from iron and ammonium tartrate).	Odorless; sweetish, slightly ferruginous taste; neutral reaction.	Very soluble.	Insoluble.

TESTS FOR IDENTITY.

The aqueous solution of the salt is not precipitated, but is rendered darker, by ammonia water. If heated with potassium or sodium hydrate T.S., it yields a brownish-red precipitate, and a slight odor of ammonia is evolved. On adding potassium ferrocyanide T.S. to an aqueous solution of the salt, no blue color or precipitate is produced, unless the solution is acidulated with hydrochloric acid. If a 10-per-cent. solution of the salt be deprived of its iron by boiling with an excess of potassium or sodium hydrate T.S., the filtrate when slightly acidulated with acetic acid will gradually deposit a white, crystalline precipitate.

If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.) and then allowed to cool and mixed with a few drops of starch T.S., it should require about 15 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron.)

Uses.—This is a mild ferruginous tonic, and is given in doses of ten to thirty grains (0.6 to 1.9 Gm.).

The French use this salt by making it into an olive-shaped ball, to which a loop of string is attached; a lead-pencil or any convenient stick is run through the loop, and the ball suspended over a glass containing wine or water, at such a height as to dip into the liquid, so as to dissolve the necessary quantity: the liquid is soon impregnated with the iron salt, and a second dose is prepared like the first by refilling the glass. This form is called "*Boule de Mars*," and furnishes a ready method of obtaining a mild chalybeate draught.

FERRI HYPOPHOSPHIS. U. S. Ferric Hypophosphite.

Preparation.—This is among the hypophosphites brought into notice in consequence of their recommendation by Dr. Churchill in the treatment of phthisis, in which they were thought to be useful by the intro-

duction of phosphorus into the system. This particular salt may be considered preferable to others when a marked condition of anæmia indicates a deficiency of iron in the tissues. It may be made by the action of hypophosphorous acid on ferrous carbonate formed by precipitation from ferrous sulphate; but, as some difficulty has been found in obtaining this acid perfectly pure, preference has been given to the plan of double decomposition. This salt may be made by causing ferrous sulphate and calcium hypophosphite to react on each other in molecular proportions represented by 480 grains of crystallized ferrous sulphate and 326 grains of commercial hypophosphite,—in the latter an allowance of 10 per cent. being made for impurities ordinarily found in that salt. These quantities will yield 320 grains of ferric hypophosphite, and the reaction will be represented by the following formula:

Calcium sulphate is precipitated, and ferrous hypophosphite is held in solution. In this condition the salt is a ferrous compound; but on evaporation the ferrous salt becomes ferric, and acquires the properties detailed in the Pharmacopœia.

Ferri Hypophosphis. U. S.	ODOR AND TASTE.	SOLUBILITY.	
		Water.	Other Solvents.
A white or grayish-white powder, permanent in the air.	Odorless; nearly tasteless.	Slightly soluble; more readily soluble in presence of hypophosphorous acid.	Freely soluble in warm, concentrated solutions of the chlorides of the alkalis, with which it forms green solutions.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
When strongly heated in a dry test-tube, the salt evolves a spontaneously inflammable gas (hydrogen phosphide), and, on complete ignition, leaves a residue of ferric pyrophosphate. The salt is readily oxidized by nitric acid or other oxidizing agents.	Phosphate.	If 0.5 Gm. of the salt be boiled with 10 C.c. of potassium or sodium hydrate T.S., a reddish-brown precipitate will be produced; and if to the filtrate from the latter, slightly acidulated with hydrochloric acid, magnesia mixture be added, and subsequently an excess of ammonia water, no crystalline precipitate should be produced.
If 0.1 Gm. of Ferric Hypophosphite be mixed with 10 C.c. of water, then 10 C.c. of diluted sulphuric acid and 50 C.c. of decinormal potassium permanganate V.S. added, and the mixture boiled for fifteen minutes, it should require not more than 3 C.c. of decinormal oxalic acid V.S. to discharge the red color (corresponding to at least 98.1 per cent. of the pure salt).	Carbonate.	If to 0.5 Gm. of the salt 5 C.c. of acetic acid be added, no effervescence should occur.
	Calcium.	And if the mixture be subsequently heated to boiling, the filtrate, upon cooling, should afford no turbidity with ammonium oxalate T.S.

Uses.—Ferric hypophosphite is given in anæmia and in cases of defective nerve-nutrition: it is administered in the form of pills, powders, or syrup. The dose is from five to ten grains (0.3 to 0.6 Gm.).

FERRI IODIDUM SACCHARATUM. U. S. Saccharated Ferrous Iodide.

	Metric.	Old form.
Iron, in the form of fine, bright wire, and cut into small pieces	6 Gm.	80 grains.
Reduced Iron	1 Gm.	5 grains.
Iodine	17 Gm.	85 grains.
Distilled Water, Sugar of Milk, recently dried, each, a sufficient quantity,		
To make	100 Gm.	500 grains.

Mix the Iron Wire, Iodine, and 20 C.c. [old form 3 fl. dr.] of Distilled Water in a flask of thin glass, shake the mixture occasionally, until the reaction ceases, and the solution has acquired a green color and lost the smell of Iodine; then filter it through a small, wetted filter into a porcelain capsule containing 40 Gm. [old form 200 gr.] of Sugar of Milk. Rinse the flask and Iron Wire with a little Distilled Water, pass the rinsings through the filter into the capsule, and evaporate, on a water-bath, with frequent stirring, until a dry mass remains. Transfer this quickly to a heated iron mortar, reduce it to powder, and mix it intimately, by trituration, with the Reduced Iron and enough Sugar of Milk to make the final product weigh 100 Gm. [old form 500 grains].

Transfer the powder at once to small and perfectly dry bottles, which should be securely stoppered, and kept in a cool and dark place.

This process requires first the production of ferrous iodide (see Syrupus Ferri Iodidi, page 304); the solution is then evaporated quickly and granulated, diluted with sugar of milk, powdered, and at once introduced into bottles. This powder, upon keeping, is very apt to become oxidized and show the presence of free iodine. The object of adding reduced iron to the finished product is that it may combine with any iodine set free. When of a brown color it should not be dispensed.

Ferri Iodidum Saccharatum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A yellowish-white or grayish, very hygroscopic powder.	Odorless; sweetish, ferruginous taste; slightly acid reaction.	At 15° C. (59° F.), 7 parts, with the exception of the added reduced iron, and forming an almost clear solution.	Partially soluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution yields a blue precipitate with potassium ferricyanide T.S. If mixed with a little starch T.S., and afterwards with a little chlorine water, the solution assumes a deep blue color.</p> <p>If 1.55 (1.5447) Gm. of Saccharated Ferrous Iodide be dissolved in about 20 C.c. of water, in a small flask, and to this solution be successively added, first, 22 C.c. of decinormal silver nitrate V.S., then 5 C.c. of diluted nitric acid and 5 C.c. of ferric ammonium sulphate T.S., it should not require more than 2 C.c. of decinormal potassium sulphocyanate V.S. to produce a reddish-brown tint, which persists after shaking (corresponding to about 20 per cent. of pure Ferrous Iodide).</p>	Salts of Fixed Alkalies.	<p>When strongly heated, the compound swells up, evolves the odor of iodine and of burnt sugar, and, on complete ignition, leaves a residue, which should yield nothing soluble to water.</p> <p>The color produced by adding to the salt some starch T.S., and afterwards a little chlorine water, should not be developed in the aqueous solution by starch T.S. alone.</p>
	Free Iodine.	

SYRUPUS FERRI IODIDI. U. S. Syrup of Ferrous Iodide.

A syrupy liquid containing 10 per cent. of Ferrous Iodide [FeI ; 809.1].

This syrup is prepared by forming a solution of ferrous iodide by acting on iron wire with iodine in the presence of water; the green solution of ferrous iodide is then protected by the addition of syrup, and the mixture is filled into small, well-stoppered bottles which are accessible to daylight. The object of exposing the syrup to daylight is to prevent the separation of free iodine, to which the irritant action is due, the syrup being prone to decomposition and discoloration from this separation: when iodine is diffused through water and is exposed to light, colorless hydriodic acid is formed, and this is measurably protected from change through the intervention of the syrup. (See *Syrupus Acidi Hydriodici*, page 300.) The dose of this syrup is from ten to thirty minims (0.6 to 1.8 C.c.): it should be largely diluted, and sucked through a glass tube, to protect the teeth from injury.

PILULÆ FERRI IODIDI. U. S. Pills of Ferrous Iodide.

The liability to decomposition of ferrous iodide has led to various forms of administration which will present it unaltered. The official pills of ferrous iodide are directed to be coated with an ethereal solution of tolu to preserve them from change. The pills contain ferrous iodide, sugar, extract of glycyrrhiza, glycyrrhiza, and acacia. There is in each pill nearly one grain of ferrous iodide. Ferrous iodide is a valuable salt in diseases attended with anæmia which require the use of an alterative. The dose is one or two pills.

FERRI LACTAS. U. S. Ferrous Lactate.

Preparation.—This salt may be made by the former official process:

Take of Lactic Acid, 1 fl. oz.; Iron, in the form of filings, 240 grains; Distilled Water, a sufficient quantity. Mix the Acid with a pint of Distilled Water in an iron vessel, add the Iron, and digest the mixture on a water-bath, supplying Distilled Water, from time to time, to preserve the measure. When the action has ceased, filter the solution, while hot, into a porcelain capsule, and set it aside to crystallize. At the end of forty-eight hours, decant the liquid, wash the crystals with a little alcohol, and dry them on bibulous paper. By evaporating the mother-water in an iron vessel to one-half, filtering while hot, and setting the liquid aside, more crystals may be obtained.

Ferri Lactas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Pale, greenish-white crusts, consisting of small, needle-shaped crystals, permanent in the air. When heated on platinum foil, the salt froths up, gives out thick, white, acrid fumes, and chars, a brown-red residue being finally left.	Slight, peculiar odor; mild, sweetish, ferruginous taste; slightly acid reaction.	At 15° C. (59° F.), 40 parts. Boiling, 12 parts.	Almost insoluble.	Freely soluble in solution of an alkaline citrate, yielding a green solution.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution of the salt has a greenish-yellow color.</p> <p>The aqueous solution yields a blue precipitate with potassium ferri-cyanide T.S.</p> <p>The aqueous solution yields a light blue precipitate with potassium ferrocyanide T.S.</p>	<p>Sulphate, Chloride, Tartrate, Malate, and of Foreign Metals.</p> <p>Sulphate, Chloride.</p> <p>Sugar.</p> <p>Butyric Acid.</p> <p>Carbonate.</p> <p>Sugar, Gum, Readily Carbonisable Impurities.</p> <p>Foreign Salts.</p>	<p>A 2-per-cent. aqueous solution of the salt should not afford with lead acetate T.S., nor, after acidulation with hydrochloric acid, with hydrogen sulphide T.S., more than a whitish opalescence.</p> <p>The aqueous solution, acidulated with nitric acid, should not afford more than a slight opalescence with barium chloride T.S., or with silver nitrate T.S.</p> <p>If 25 C.c. of the aqueous solution (1 in 50), mixed with 5 C.c. of diluted sulphuric acid, be boiled for a few minutes, then precipitated by an excess of potassium or sodium hydrate T.S., the filtrate, mixed with a few drops of alkaline cupric tartrate V.S. and heated to boiling, should not afford a red precipitate.</p> <p>If a portion of the salt be triturated with strong sulphuric acid, no offensive odor should be developed,</p> <p>Nor should any gas be evolved,</p> <p>And the mixture, after standing for some time, should not assume a brown color.</p> <p>If 1 Gm. of the salt, contained in a porcelain crucible, be moistened with nitric acid, and carefully ignited, it should leave a residue of ferric oxide weighing not less than 0.270 or more than 0.278 Gm. This residue should not have an alkaline reaction upon litmus paper, nor yield anything soluble to water.</p>

Uses.—Ferrous lactate is used as a chalybeate because it is believed to be more readily assimilated than other iron salts. It is given in doses of one to five grains (0.06 to 0.3 Gm.).

FERRI OXIDUM HYDRATUM. U.S. Ferric Hydrate.

[FERRIC HYDROXIDE. HYDRATED OXIDE OF IRON.]

	Metric.	Old form.
Solution of Ferric Sulphate	100 C c.	10 fl. oz.
Ammonia Water	110 C.c.	11 fl. oz.
Water, a sufficient quantity.		

To the Ammonia Water, previously diluted with 250 C.c. [old form 25 fl. oz.] of cold Water, add, under constant stirring, the Solution of Ferric Sulphate, previously diluted with 1000 C.c. [old form 100 fl. oz.] of cold Water. As soon as the precipitate has subsided, draw off the clear liquid by means of a siphon, then mix the precipitate intimately with about 1000 C.c. [old form 100 fl. oz.] of cold Water, again draw off the clear liquid after subsidence of the precipitate, and repeat this operation, until a portion of the decanted liquid gives not more than a slight cloudiness with barium chloride test-solution. Finally transfer the precipitate to a wet muslin strainer, and, after it has drained, mix it with sufficient cold Water to make the mixture weigh 250 Gm. [old form 25 oz. av.].

When Ferric Hydrate is to be made in haste, for use as an antidote, the washing may be performed more quickly, though less perfectly, by transferring the precipitate at once to a wet muslin strainer, pressing forcibly with the hands, until no more liquid passes, and then adding enough Water to make the whole weigh about 250 Gm. [old form 25 oz. av.].

Note.—The ingredients for preparing Ferric Hydrate as an antidote should always be kept on hand in bottles containing, respectively, 200 C.c. [old form 6 fl. oz.] of the Solution of Ferric Sulphate, and 220 C.c. [old form 6½ fl. oz.] of Ammonia Water.

The reaction is as follows :

Ammonia water is preferred as the precipitant, because an excess is easily detected by the odor, and the salt formed is easily washed out.

Uses.—This compound is used as the basis of several iron salts, citrate, tartrate, etc., and also as the antidote to poisoning by arsenic. For the latter purpose it should be administered freely. It acts by producing insoluble ferrous arsenate.

It should never be kept on hand, as it decomposes even when kept under water: the ingredients should always be kept already weighed out, placed in suitable bottles, *and in an accessible and well-known place in the store*, so that if wanted quickly it can be made without the unnecessary loss of a moment's time.

FERRI OXIDUM HYDRATUM CUM MAGNESIA. U.S. Ferric Hydrate with Magnesia.

[ARSENIC ANTIDOTE.]

	Metric.	Old form.
Solution of Ferric Sulphate	50 C.c.	1 fl. oz. 5½ fl. dr.
Magnesia	10 Gm.	154 grains.
Water, a sufficient quantity.		

Mix the Solution of Ferric Sulphate with 100 C.c. [old form 3 fl. oz.] of Water, and keep the liquid in a large, well-stoppered bottle. Rub the Magnesia with cold Water to a smooth and thin mixture, transfer this to a bottle capable of holding about 1000 C.c. [old form 2 pints], and fill it with Water to about three-fourths of its capacity. When the preparation is wanted for use, shake the Magnesia mixture to a homogeneous, thin magma, add it gradually to the Iron Solution, and shake them together until a uniform, smooth mixture results.

Note.—The diluted Solution of Ferric Sulphate, and the mixture of Magnesia with Water, should always be kept on hand, ready for immediate use.

Uses.—This preparation furnishes a ready and efficient antidote against arsenous acid. Ferric hydrate is produced when the mixture of magnesia is added to the diluted solution of ferric tersulphate, and,

as the magnesia is in excess and acidity thus prevented, no harm can result from not separating the by-products of the reaction. It contains in addition magnesium sulphate and hydrate. It has been shown that no soluble compound with arsenic is formed when it is used as an antidote, and the presence of the magnesium salts, from a therapeutical point of view, is not objectionable.

FERRI PHOSPHAS SOLUBILIS. U.S. Soluble Ferric Phosphate.

	Metric.	Old form.
Ferric Citrate	50 Gm.	10 oz. av.
Sodium Phosphate, uneffloresced	55 Gm.	11 oz. av.
Distilled Water	100 C.c.	19 fl. oz.

Dissolve the Ferric Citrate in the Distilled Water by heating on a water-bath. To this solution add the Sodium Phosphate, and stir constantly until it is dissolved. Evaporate the solution on a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of thick syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in dark amber-colored, well-stoppered bottles.

This is a scaled salt, and very different from the insoluble slate-colored powder of iron phosphate formerly official. It is not a definite chemical compound, but is sometimes termed sodio-ferric citrophosphate. It greatly resembles the official ferric pyrophosphate.

Ferri Phosphas Solubilis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, bright green, transparent scales, permanent in dry air when excluded from light, but becoming dark and discolored on exposure to light.	Odorless; acidulous, slightly saline taste. Slightly acid reaction.	Freely and completely.	Insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>With potassium ferrocyanide T.S. the solution gives a blue color, but does not yield a blue precipitate, unless it has been acidulated with hydrochloric acid.</p> <p>If 1 Gm. of the salt be boiled with 10 C.c. of potassium or sodium hydrate T.S., a reddish-brown precipitate is produced, and if the colorless filtrate from this precipitate be strongly acidulated with hydrochloric acid, then magnesia mixture added, and subsequently a slight excess of ammonia water, an abundant white, crystalline precipitate will be produced.</p>	Pyrophosphate.	<p>If a portion of the filtrate from this precipitate be acidulated with acetic acid, and heated to boiling, no further precipitate should be produced.</p>

QUANTITATIVE TEST.

If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be allowed to stand for half an hour at a temperature of 40° C. (104° F.), and then allowed to cool, and mixed with a few drops of starch T.S., it should require about 12 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).

Uses.—This is a mild and safe ferruginous tonic. It is given in doses of five to ten grains (0.3 to 0.6 Gm.).

FERRI PYROPHOSPHAS SOLUBILIS. U.S. Soluble Ferric Pyrophosphate.

[FERRI PYROPHOSPHAS, PHARM. 1880.]

	Metric.	Old form.
Ferric Citrate	50 Gm.	8 oz. av.
Sodium Pyrophosphate, uneffloresced	50 Gm.	8 oz. av.
Distilled Water	100 C.c.	16 fl. oz.

Dissolve the Ferric Citrate in the Distilled Water, by heating on a water-bath. To this solution add the Sodium Pyrophosphate, and stir constantly until it is dissolved. Evaporate the solution, on a water-bath, at a temperature not exceeding 60° C. (140° F.), to the consistence of thick syrup, and spread it on plates of glass, so that, when dry, the salt may be obtained in scales.

Keep the product in dark amber-colored, well-stoppered bottles.

This compound is a mixture of several salts,—sodio-ferric pyrophosphate, sodio-ferric citrate, and ferric citrate. It differs from the salt official in 1870, which was the insoluble ferric pyrophosphate, $\text{Fe}_2\text{P}_2\text{O}_7$, dissolved in solution of ammonium citrate: the ammonium salt is less stable than the sodium compound, being slowly decomposed on exposure to the air, and the process yielded an unsatisfactory product.

Ferri Pyrophosphas Solubilis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Thin, apple-green, transparent scales, permanent in dry air when excluded from light, but turning dark on exposure to light. The aqueous solution of the salt is rendered blue by potassium ferrocyanide T.S., but does not yield a blue precipitate with this reagent unless it has been acidulated with hydrochloric acid.	Odorless; acidulous, slightly saline taste; slightly acid reaction.	Freely and completely soluble.	Insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

If 1 Gm. of the salt be boiled with 10 C.c. of potassium or sodium hydrate T.S., a reddish-brown precipitate will be produced, and if the colorless filtrate from this precipitate be strongly acidulated with hydrochloric acid, then magnesia mixture added, and subsequently a slight excess of ammonia water, no precipitate should be produced (distinction from and absence of *ferric phosphate*).

If a portion of the filtrate be acidulated with acetic acid, and heated to boiling, an abundant, white, flocculent precipitate (pyrophosphate) will be produced.

If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of 100 C.c.) in 10 C.c. of water, then 10 C.c. of hydrochloric acid and subsequently 40 C.c. of water added, and, after the addition of 1 Gm. of potassium iodide, the mixture be allowed to stand for half an hour at a temperature of 40° C. (104° F.), and then allowed to cool, and mixed with a few drops of starch T.S., it should require about 10 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).

Uses.—This is one of the best of the mild ferruginous preparations. It is very largely used on account of its solubility and the ease with

which it can be administered either in pills or in solution. The dose is two to five grains (0.13 to 0.3 Gm.).

FERRI SULPHAS. U. S. Ferrous Sulphate.

Preparation.—This salt is rarely made by the pharmacist, because the commercial article is furnished much more cheaply than the salt made on the small scale. The following is the British process:

Take of Iron Wire 4 oz. av.; Sulphuric Acid 4 fl. oz. [Imperial measure]; Distilled Water $1\frac{1}{2}$ pints [Imp. meas.]. Pour the Water on the Iron placed in a porcelain dish, add the Sulphuric Acid, and, when the disengagement of gas has nearly ceased, boil for ten minutes. Filter now through paper, and, after the lapse of twenty-four hours, separate the crystals which have been deposited from the solution. Let these be dried on filtering paper placed on porous bricks, and be preserved in a stoppered bottle.

The salt is a by-product in the manufacture of hydrogen, the following being the reaction:

Ferri Sulphas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Large, pale bluish-green, monoclinic prisms, efflorescent in dry air, and absorbing oxygen rapidly on exposure to air, becoming coated with brownish-yellow, basic ferric sulphate. When slowly heated to 115° C. (239° F.), the crystals fall to powder and lose 38.84 per cent. of their weight (6 molecules of water of crystallization).	Odorless; saline, styptic taste; acid reaction.	At 15° C. (59° F.), 1.8 parts. Boiling, 0.3 part.	Insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution of the salt affords a blue precipitate of potassium ferricyanide T.S., and a white precipitate, insoluble in hydrochloric acid, with barium chloride T.S.</p> <p>If 1.39 (1.3871) Gm. of the salt be dissolved in about 25 C.c. of water, and the solution acidulated with sulphuric acid, not less than 50 C.c. of decinormal potassium permanganate V.S. should be required to impart to the liquid a permanent pink color (each C.c. of the volumetric solution indicating 2 per cent. of crystallized Ferrous Sulphate).</p>	<p>Copper, Zinc, etc.</p> <p>Limit of the Salts of the Fixed Alkalies.</p>	<p>If 1 Gm. of the salt be dissolved in about 25 C.c. of water, the solution heated to boiling, oxidized with nitric acid, and then a slight excess of ammonia water added, the filtrate from the reddish-brown precipitate should be colorless, and should not be affected by hydrogen sulphide T.S.</p> <p>If another portion of the filtrate be evaporated to dryness and then ignited, it should not leave more than a trace of residue.</p>

Uses.—This is a very astringent iron salt. When used internally, the exsiccated salt is preferred. The impure ferrous sulphate, called

copperas,¹ is used as a disinfectant. The dose of the sulphate is one to two grains (0.06 to 0.13 Gm.).

FERRI SULPHAS EXSICCATUS. U.S. Dried Ferrous Sulphate.

Approximately $2\text{FeSO}_4 + 3\text{H}_2\text{O} = 857.28$.

	Metric.	Old form.
Ferrous Sulphate, in coarse powder	100 Gm.	25 oz. av.

Allow the salt to effloresce at a temperature of about 40°C . (104°F .), and then heat it in a porcelain dish, on a water-bath, constantly stirring, until the product weighs from 64 to 65 Gm. [old form 16 oz. av.]. Lastly, reduce the residue to a fine powder, and transfer it at once to perfectly dry, well-stoppered bottles.

This process does not deprive the ferrous sulphate of all its water of crystallization, about 15 per cent. being retained. One hundred parts of crystallized sulphate yield about 64 per cent. of the dried salt.

Uses.—Dried ferrous sulphate is a grayish-white powder, and is principally used in making pills, the crystallized sulphate being unfitted for the purpose on account of the large proportion of water that it contains. Five grains of the crystals are represented by three grains of the dried sulphate. It is used in the official pills of aloes and iron.

FERRI SULPHAS GRANULATUS. U.S. Granulated Ferrous Sulphate.

$\text{FeSO}_4 + 7\text{H}_2\text{O} = 277.42$.

[FERRI SULPHAS PRÆCIPITATUS, PHARM. 1880.]

	Metric.	Old form.
Ferrous Sulphate	100 Gm.	4 oz. av.
Distilled Water	100 C.c.	4 fl. oz.
Diluted Sulphuric Acid	5 C.c.	1½ fl. dr.
Alcohol	25 C.c.	1 fl. oz.

Dissolve the Ferrous Sulphate in the Distilled Water previously heated to boiling, add the Diluted Sulphuric Acid, and filter the solution while hot. Evaporate the solution immediately in a tared porcelain capsule, on a sand-bath, until it weighs 150 Gm. [old form 6 oz. av.], and then cool it quickly, under constant stirring. Transfer the product to a glass funnel stopped with a plug of absorbent cotton, and, when it has thoroughly drained, pour upon it the Alcohol. When this also has drained, spread the crystalline powder on bibulous paper, dry it quickly in the sunlight, or in a dry room, at the ordinary temperature, and transfer it at once to perfectly dry, well-stoppered bottles.

Ferrous sulphate is insoluble in alcohol; hence, if a strong aqueous solution is poured into alcohol, it is precipitated in the form of a granular crystalline powder, and this method was used in the U. S. P. 1880 for procuring this salt. The U. S. P. 1890 process differs from that formerly official in that the sulphate is not precipitated but gran-

¹ This unfortunate synonyme, "*copperas*," has led to a great many errors, through the impression that this salt must contain copper. It is often confounded with the poisonous salt copper sulphate, or blue vitriol, and they have been substituted for each other. (See Synonymes, page 31.)

ulated, and subsequently washed with alcohol to free it from impurities. The present method, in our opinion, is not an improvement, but is probably better adapted for large operations.

Uses.—Granulated ferrous sulphate should be used in preference to the large crystals at the prescription counter; the precipitation in alcohol not only furnishes it in a convenient form, but the soluble impurities are washed out. It is much less liable to oxidation and change than the ordinary crystallized sulphate.

FERRI VALERIANAS. U. S. Ferric Valerianate.

Preparation.—Ferric valerianate may be made by mixing solutions of ferric sulphate and sodium valerianate: double decomposition results in the precipitation of ferric valerianate, whilst sodium sulphate remains in solution.

Ferri Valerianasa. U. S.	ODOR AND TASTE.	SOLUBILITY.	
		Water.	Alcohol.
A dark, brick-red, amorphous powder, of somewhat varying chemical composition, permanent in dry air.	Odor of valerianic acid; mildly styp-tic taste.	Cold, Insoluble. Boiling, Is decomposed, setting free the valerianic acid and leaving ferric hydrate.	Readily insoluble.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.

When slowly heated, the salt parts with its acid, without fusing, but when rapidly heated it fuses and gives off inflammable vapors having the odor of butyric acid. On ignition, ferric oxide remains. The stronger acids decompose the Valerianate, liberating valerianic acid.

If 0.56 (0.5588) Gm. of the salt be dissolved in a glass-stoppered bottle (having a capacity of about 100 C.c.) in 2 C.c. of hydrochloric acid and 15 C.c. of water, and after the addition of 1 Gm. of potassium iodide the mixture be allowed to stand for half an hour at a temperature of 40° C. (104° F.), then allowed to cool, and mixed with a few drops of starch T.S., it should require not less than 15 nor more than 20 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 1 per cent. of metallic iron).

Uses.—This salt is of very little use in pharmacy or medicine: it is rarely prescribed. The dose is one to ten grains (0.06 to 0.6 Gm.).

LIQUOR FERRI ACETATIS. U. S. Solution of Ferric Acetate.

An aqueous solution of Ferric Acetate [$\text{Fe}_2(\text{C}_2\text{H}_3\text{O}_2)_6 = 464.92$], containing about 31 per cent. of the anhydrous salt, and corresponding to about 7.5 per cent. of metallic iron.

	Metric.	Old form.
Solution of Ferric Sulphate	1000 Gm.	14½ fl. oz.
Glacial Acetic Acid	260 Gm.	4½ fl. oz.
Ammonia Water	850 C.c.	16 fl. oz.

Water,

Distilled Water, each, a sufficient quantity,

To make	1000 Gm.	1 pint.
-------------------	----------	---------

Mix the Ammonia Water with 3000 C.c. [old form 3 pints] of cold Water, and the solution of Ferric Sulphate with 10000 C.c. [old form 10 pints] of cold Water. Add the latter solution slowly to the diluted Ammonia Water, stirring constantly. Let the mixture stand until the precipitate has subsided as far as practicable, and then decant the supernatant liquid. Add to the precipitate 6000 C.c. [old form 6 pints] of boiling Water, mix well, and again set the mixture aside, as before. Repeat the washing with successive portions of boiling Water, in the same manner, until the washings are no longer affected by sodium cobaltic nitrite test-solution (showing the removal of ammonia and its salts. Transfer the mixture to a wet muslin strainer, allow the precipitate to drain completely, and press it, folded in the strainer, until its weight is reduced to 700 Gm. [old form 14 oz. av.] or less. Now add the precipitate gradually to the Glacial Acetic Acid contained in a tared jar provided with a glass stopper, stirring the mixture after each addition until each portion added is nearly dissolved before adding another portion. Finally, add enough Distilled Water to make the product weigh 1000 Gm. [or measure, old form, 1 pint], mix thoroughly, allow it to become clear by subsidence, and decant the clear solution.

Keep the product in well-stoppered bottles, in a cool place, protected from light.

Liquor Ferri Acetatis. U.S.	ODOR, TASTE, AND REACTION.	
A dark reddish-brown, transparent liquid. Sp. gr. about 1.160 at 15° C. (59° F.).	Acetous odor; sweetish, acidulous, faintly styptic taste; slightly acid reaction.	
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The diluted Solution affords a brownish-red precipitate with ammonia water, and a blue precipitate with potassium ferrocyanide T.S. When heated to boiling, the Solution yields a brownish-red precipitate, and when heated with sulphuric acid, the Solution evolves acetous vapors.</p> <p>If 1.12 (1.1176) Gm. of the Solution be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then allowed to cool, and mixed with a few drops of starch T.S., it should require about 15 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution consumed representing 0.5 per cent. of metallic iron).</p>	Zinc, Copper.	<p>If the iron be completely precipitated from a portion of the Solution by an excess of ammonia water, a portion of the filtrate should not yield a white or a dark-colored precipitate with hydrogen sulphide T.S.</p>
	Salts of the Fixed Alkalies.	<p>The Solution, after the iron has been completely precipitated from it by an excess of ammonia water, should leave no fixed residue on evaporation and gentle ignition.</p>
	Ferrous Salt.	<p>If to a small portion of the Solution, diluted with about 10 volumes of water, a few drops of freshly prepared potassium ferrocyanide T.S. be added, it should impart to it a pure brown color without a trace of blue.</p>

Uses.—This solution has been made official. The dose is five minims (0.3 C.c.).

LIQUOR FERRI ET AMMONII ACETATIS. U. S. Solution of Iron and Ammonium Acetate.

[MISTURA FERRI ET AMMONII ACETATIS, PHARM. 1880. BASHAM'S MIXTURE.]

	Metric.	Old form.
Tincture of Ferric Chloride	20 C.c.	2 fl. dr.
Diluted Acetic Acid	30 C.c.	8 fl. dr.
Solution of Ammonium Acetate	200 C.c.	2½ fl. oz.
Aromatic Elixir	100 C.c.	1½ fl. oz.
Glycerin	120 C.c.	1½ fl. oz.
Water, a sufficient quantity,		

To make	1000 C.c.	12½ fl. oz.
-------------------	-----------	-------------

To the Solution of Ammonium Acetate (which should not be alkaline) add, successively, the Diluted Acetic Acid, the Tincture of Ferric Chloride, the Aromatic Elixir, and the Glycerin, and, lastly, enough Water to make the product measure 1000 C.c. [old form 12½ fl. oz.].

This preparation should be freshly made when wanted.

This solution has been improved in the U. S. P. 1890 by the addition of glycerin. It is not intended to be a permanent preparation, and in time will decompose. Some pharmacists prefer to keep in a shop bottle all the ingredients mixed together except the tincture of ferric chloride, and, when called for, add the proper quantity of the tincture to the quantity to be dispensed. In this way time is saved and a fresh preparation always furnished.

This is a mild ferruginous solution, of very pleasant taste, and is often known as Basham's mixture. It is given in doses of four fluidrachms to one fluidounce (15 to 30 C.c.).

LIQUOR FERRI NITRATIS. U. S. Solution of Ferric Nitrate.

An aqueous solution of Ferric Nitrate [$\text{Fe}_2(\text{NO}_3)_6 = 483.1$], containing about 6.2 per cent. of the anhydrous salt, and corresponding to about 1.4 per cent. of metallic iron.

	Metric.	Old form.
Solution of Ferric Sulphate	180 Gm.	2 fl. oz. 5 fl. dr.
Ammonia Water	160 C.c.	3 fl. oz.
Nitric Acid	71 Gm.	7½ fl. dr.
Distilled Water,		
Water, each, a sufficient quantity,		

To make	1000 Gm.	20 oz. av.
-------------------	----------	------------

Mix the Ammonia Water with 500 C.c. [old form 8 fl. oz.] of cold Water, and the Solution of Ferric Sulphate with 1500 C.c. [old form 24 fl. oz.] of cold Water. Add the latter solution slowly to the diluted Ammonia Water, with constant stirring. Let the mixture stand until the precipitate has subsided as far as practicable, and then decant the supernatant liquid. Add to the precipitate 1000 C.c. [old form 16 fl. oz.] of cold Water, mix well, and again set the mixture aside, as before. Repeat the washing with successive portions of cold Water, in the same manner, until the washings produce but a slight cloudiness with barium chloride test-solution. Pour the washed ferric hydrate on a wet muslin strainer, and let it drain thoroughly. Then transfer

it to a porcelain capsule, add the Nitric Acid, and stir with a glass rod, until a clear solution is obtained. Finally, add enough Distilled Water to make the finished product weigh 1000 Gm. [old form 20 oz. av.]. Filter, if necessary.

Liquor Ferri Nitratis. U. S.	TESTS FOR IDENTITY AND QUANTITATIVE TEST.
<p>A transparent, amber-colored or reddish liquid, without odor, having an acid, strongly styptic taste, and an acid reaction. Sp. gr. 1.050 at 15° C. (59° F.). The Solution affords a brown-red precipitate with ammonia water, and a blue precipitate with potassium ferrocyanide T.S.</p>	<p>If a clear crystal of ferrous sulphate be added to a cooled mixture of equal volumes of concentrated sulphuric acid and of the Solution, the crystal rapidly becomes brown and surrounded by a brownish-black zone.</p> <p>If 1.12 (1.1176) Gm. of the Solution be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T.S., it should require about 2.8 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 0.5 per cent. of metallic iron).</p>

Uses.—This solution is tonic and astringent. It is given in doses of five to ten minims (0.3 to 0.6 C.c.).

LIQUOR FERRI SUBSULPHATIS. U. S. Solution of Ferric Subsulphate.

[SOLUTION OF BASIC FERRIC SULPHATE. MONSEL'S SOLUTION.]

An aqueous solution of Basic Ferric Sulphate (of variable chemical composition), corresponding to about 13.6 per cent. of metallic iron.

	Metric.	Old form.
Ferrous Sulphate, in clear crystals	675 Gm.	16 oz. av. 628 gr.
Sulphuric Acid	65 Gm.	7 fl. dr.
Nitric Acid,		
Distilled Water, each, a sufficient quantity,		
To make	1000 Gm.	1 pint.

Add the Sulphuric Acid to 500 C.c. [old form 7 fl. oz.] of Distilled Water in a capacious porcelain capsule, heat the mixture to nearly 100° C. (212° F.), then add 65 Gm. [old form 1 fl. oz. 1 fl. dr.] of Nitric Acid, and mix well. Divide the Ferrous Sulphate, coarsely powdered, into four equal portions, and add these portions, one at a time, to the hot liquid, stirring after each addition until effervescence ceases. When all of the Ferrous Sulphate is dissolved, add a few drops of Nitric Acid, and, if this causes a further evolution of red fumes, continue to add Nitric Acid, a few drops at a time, until it no longer causes red fumes to be evolved; then boil the Solution until it assumes a ruby-red color and is free from nitrous odor. Lastly, add enough Distilled Water to make the product weigh 1000 Gm. [or measure, old form, 1 pint]. Keep the product in well-stoppered bottles, in a moderately warm place (not under 22° C., or 71.6° F.), protected from light.

This solution will sometimes crystallize, forming a semi-solid, whitish mass. When this occurs, the application of a gentle heat to the bottle will restore the liquid condition.

Add the Sulphuric Acid to 200 C.c. [old form 3 fl. oz.] of Distilled Water in a capacious porcelain capsule, heat the mixture to nearly 100° C. (212° F.), then add 55 Gm. [old form 6½ fl. dr.] of Nitric Acid, and mix well. Divide the Ferrous Sulphate, coarsely powdered, into four equal portions, and add these portions, one at a time, to the hot liquid, stirring after each addition until effervescence ceases. When all of the Ferrous Sulphate is dissolved, add a few drops of Nitric Acid, and, if this causes a further evolution of red fumes, continue to add Nitric Acid, a few drops at a time, until it no longer causes red fumes to be evolved; then boil the Solution until it assumes a reddish-brown color and is free from nitrous odor. Lastly, add enough Distilled Water to make the product weigh 1000 Gm. [or measure, old form, 1 pint]. Filter, if necessary.

This solution differs from the solution of ferric subsulphate merely in containing a larger proportion of sulphuric acid. It has the sp. gr. 1.320, and is a solution of the *true* persulphate $\text{Fe}_2(\text{SO}_4)_3$, or normal ferric sulphate. Solution of persulphate of iron is the name under which Monsel's solution is erroneously prescribed. The latter is a solution of a subsalt, $\text{Fe}_4\text{O}(\text{SO}_4)_6$. The reaction is as follows:

Liquor Ferri Tersulphatis. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
'A dark reddish-brown liquid. Specific gravity, about 1.320 at 15° C. (59° F.). The diluted solution affords a brownish-red precipitate with ammonia water, a blue one with potassium ferrocyanide T.S., and a white one, insoluble in hydrochloric acid, with barium chloride T.S.	Almost odorless; acid, strongly styptic taste; acid reaction.	Miscible, in all proportions, without decomposition.	Miscible, in all proportions, without decomposition.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.		TESTS FOR IMPURITIES.
On slowly mixing 2 volumes of the Solution with 1 volume of concentrated sulphuric acid, in a beaker, the mixture does not separate a solid, white mass on standing (difference from <i>sub-sulphate</i>). If 1.12 (1.1176) Gm. of the Solution be introduced into a glass-stoppered bottle (having a capacity of about 100 C.c.), together with 15 C.c. of water and 2 C.c. of hydrochloric acid, and, after the addition of 1 Gm. of potassium iodide, the mixture be kept for half an hour at a temperature of 40° C. (104° F.), then cooled, and mixed with a few drops of starch T.S., it should require about 16 C.c. of decinormal sodium hyposulphite V.S. to discharge the blue or greenish color of the liquid (each C.c. of the volumetric solution indicating 0.5 per cent. of metallic iron).	Nitric Acid.	On adding a clear crystal of ferrous sulphate to a cooled mixture of equal volumes of concentrated sulphuric acid and a moderately diluted portion of the Solution, the crystal should not become brown, nor should there be a brownish-black color developed around it. A few drops added to freshly prepared potassium ferricyanide T.S. should impart to it a pure brown color without a trace of green or greenish-blue.	
	Ferrous Salt.		

Uses.—This solution is largely used in pharmacy in preparing ferric hydrate through precipitation with ammonia. From this many of the

iron salts and solutions are made. It is not used medicinally to any great extent, the solution of the subsulphate being preferred.

Chromium. Cr; 52.0.

Chromium occurs in nature as chrome-iron ore, large deposits of which are found in Southeastern Pennsylvania. This metal is brittle, of a grayish-white color, and very hard, being capable of scratching glass. It forms five compounds with oxygen: 1. Monoxide, or *chromous oxide*, CrO . 2. *Trichromic tetroxide*, Cr_2O_4 . 3. Sesquioxide, or *chromic oxide*, Cr_2O_3 . 4. Dioxide, CrO_2 . 5. *Chromium trioxide*, CrO_3 . The latter alone and its salts are of pharmaceutical interest.

Tests for Chromium Salts.

1. Ammonium sulphide precipitates from solutions of chromium salts a greenish precipitate of chromic hydroxide.
2. Sodium or potassium hydrate also produces a precipitate of chromic hydroxide, soluble in excess.
3. Soluble lead salts produce yellow precipitates of lead chromate (chrome yellow).

Official Preparations containing Chromium.

Official Name.	Preparation.
Acidum Chromicum . .	Made by decomposing potassium bichromate with sulphuric acid.
Potassii Bichromas . . .	Made by removing one-half of the potassium from potassium chromate with sulphuric acid, evaporating and crystallizing (see page 681).

Unofficial Preparations of Chromium.

Chromii Bromidum, Cr_2Br_6 .	By passing bromine vapor over an ignited mixture of chromic oxide with charcoal and starch paste.
Chromium Bromide.	
Chromii Dichloridum, Cr_2Cl_6 .	By passing dry chlorine gas over a red-hot mixture of charcoal and chromic oxide.
Chromium Dichloride.	
Chromii Fluoridum, Cr_2F_6 .	By treating chromic oxide, dried, but not ignited, with excess of hydrofluoric acid, and heating the dried mass very strongly in a platinum crucible.
Chromium Fluoride.	
Chromii Iodidum, Cr_2I_6 .	By treating silver chromate with hydriodic acid and alcohol.
Chromium Iodide.	
Chromii Sulphas, $\text{Cr}_2(\text{SO}_4)_3 \cdot 5\text{H}_2\text{O}$.	By dissolving chromic oxide in strong sulphuric acid at a temperature between 50° and 60°C .
Chromium Sulphate (Green).	

ACIDUM CHROMICUM. U. S. Chromic Acid.

CrO_3 ; 99.88.

[CHROMIC TRIOXIDE. CHROMIC ANHYDRIDE.]

Preparation.—Chromic acid is readily obtained by mixing one hundred measures of a cold saturated solution of potassium bichromate with one hundred and fifty measures of sulphuric acid, and allowing the mixture to cool. The sulphuric acid unites with the potassium, and sets free the chromic anhydride, which is deposited in crystals. The mother-liquor having been poured off, these are transferred to a glass funnel, and the mother-liquor displaced by nitric acid; they are

then placed upon a tile to drain, covered with a glass bell-jar. Chromic acid should be preserved in glass-stoppered vials.

Acidum Chromicum. U.S.	ODOR AND RE-ACTION.	SOLUBILITY.	
		Water.	Alcohol, etc.
Small, dark purplish-red, needle-shaped or rhombic crystals of a metallic lustre; deliquescent in moist air; destructive to animal and vegetable tissues.	Odorless.	Very soluble, forming an orange-red solution.	Brought in contact with alcohol, ether, glycerin, and other organic solvents, decomposition takes place, sometimes with dangerous violence.
TESTS FOR IDENTITY.		IMPURITIES.	TESTS FOR IMPURITIES.
When heated, its color darkens, and finally becomes black, but is restored on cooling. At 192° to 193° C. (377.6° to 379.4° F.) it fuses to a reddish-brown liquid, which, on cooling, forms a dark red, brittle mass, furnishing a scarlet powder; above 250° C. (482° F.) it is mostly decomposed, with the formation of dark green chromic oxide and the evolution of oxygen; after protracted heating, it leaves a residue of pure chromic oxide, which should yield nothing soluble to water.		Sulphuric Acid.	If 1 Gm. of the acid be dissolved in 100 C.c. of cold water and mixed with a few C.c. of hydrochloric acid, the further addition of 1 C.c. of barium chloride T.S. should not render the solution turbid.

Uses.—Chromic acid, or, more properly, *chromic anhydride*, is a powerful caustic and antiseptic: it parts with its combined oxygen with great facility. It is a very effective caustic in destroying warty growths. Care must be used, in mixing it with glycerin, sugar, tannin, acid, alcohol, cork, or similar deoxidizing bodies, to avoid explosions. It is not used internally.

QUESTIONS ON CHAPTER XLIV.

MANGANESE, IRON, AND CHROMIUM.

Manganese—Give Latin name, symbol, and atomic weight.

How is it found?

How many compounds does it form with oxygen?

Give their names and chemical composition.

What are the tests for the salts of manganese?

Manganese dioxide—What is it?

How much per cent. of pure manganese dioxide does it contain?

Does the commercial article always contain this much?

How may its quality be tested?

Describe odor, taste, and chemical reaction.

Manganese sulphate—Give Latin name, formula in symbols, and molecular weight.

Give Prof. Diehl's process for making this salt.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Zinc; iron; copper; alkalies or magnesia.

What is the dose?

Potassium permanganate—Give Latin name.

Iron—Give Latin name, symbol, and atomic weight.

With which of the non-metallic elements does it not combine?

What compounds does it form with oxygen?

What are the tests for iron salts?

In what form is iron official?

Reduced iron—Give Latin name.

Describe Prof. Procter's process for making it.

How may its quality be tested?

Describe odor, taste, and chemical reaction.

Saccharated ferrous carbonate—Give Latin name. What is the dose?

How is it prepared? Give rationale of process.

Describe odor, taste, chemical reaction, and solubility.

How may impurity of sulphate be detected?

What is the dose?

Mass of ferrous carbonate—Give Latin name.

What was the title of this preparation in the U. S. P. 1870?

How is it made? Describe rationale of process.

What are syrup and honey used for in this preparation?

What is a common or popular name for it?

Compound iron mixture—Give Latin name.

Upon what ingredient does the usefulness of this depend?

Compound pills of iron—Give Latin name.

What is the composition of one of these pills?

Ferric chloride—Give Latin name, formula in symbols, and molecular weight.

Is this a ferrous or a ferric salt?

How is it made? Describe rationale of process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Zinc and copper; fixed alkalies; nitric acid; ferrous salt; oxychloride.

What is the dose?

Solution of ferric chloride—Give Latin name.

How much anhydrous ferric chloride does it contain?

How is it made?

If this solution when finished has a blackish color, what is indicated? What is the remedy?

If a brown precipitate occurs upon dilution or standing, what is indicated? What is the remedy?

Describe rationale of process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Zinc, copper; fixed alkalies; nitric acid; ferrous salt; oxychloride.

What are its uses?

Tincture of ferric chloride—Give Latin name.

How is this tincture prepared?

What is the object of allowing the mixture to stand three months before it is to be used?

If a brownish-red precipitate occurs upon diluting the solution of ferric chloride, what is indicated? What is the dose?

Ferric citrate—Give Latin name.

How is it prepared?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurities of fixed alkalies be detected?

What is the dose?

Iron and ammonium citrate—Give Latin name.

How is it prepared?

What is Lloyd's modification of this process?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Fixed alkalies.

What is the dose?

Solution of ferric citrate—What is its Latin official name?

How much anhydrous ferric citrate does it contain?

- How is it prepared? Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the strength of this preparation as compared with the scaled salt?
 What is the dose?
 Wine of ferric citrate—What is the Latin name?
 How is it made? What is the dose?
 Iron and quinine citrate—Give Latin name.
 How is it prepared?
 To what is the green color of the salt as frequently found in the market owing?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may its quality be tested?
 What is the dose?
 Soluble iron and quinine citrate—How is this prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How much quinine should it contain?
 How may its quality be tested?
 How is bitter wine of iron made? What is the dose?
 Iron and strychnine citrate—How is this salt prepared?
 How much strychnine does it contain?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 Syrup of iron, quinine, and strychnine phosphates—What is the Latin name?
 How is it made?
 What is a common or popular name for it?
 What is the dose?
 Ferric ammonium sulphate—Give Latin name, formula in symbols, and molecular weight.
 What is its synonyme?
 Describe the process (formerly official) by which it may be made.
 With how many molecules of water does the salt crystallize?
 Is it a stable compound?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may impurity of aluminum be detected?
 What is its use?
 Iron and ammonium tartrate—How is it made?
 What is its chemical composition, theoretically?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may impurity of fixed alkalies be detected?
 How is iron and potassium tartrate made?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 What is "Boule de Mars," and how is it used?
 Ferric hypophosphite—Give Latin name, formula in symbols, and molecular weight. Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Ferric phosphate; calcium.
 What is the dose?
 Saccharated ferrous iodide—Give Latin name.
 How is it made?
 Is it liable to change on keeping? What change takes place?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Salts or alkalies; free iodine.
 Syrup of ferrous iodide—How much ferrous iodide does it contain?
 How is it made?
 What is the object of exposing this syrup to the light?
 What is the dose, and how should it be taken?
 How are pills of iodide of iron prepared to preserve them from change?
 How much ferrous iodide is there in each pill?
 What is the dose?
 Ferrous lactate—Give Latin name, formula in symbols, and molecular weight.
 Describe the process (formerly official) for making it. Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Sulphate; citrate; tartrate.
 What is the dose?

- Ferric hydrate—How is it prepared?
 What is the advantage of keeping the ingredients on hand?
 Why is ammonia preferred to other alkalies as a precipitant?
 For what purposes is it used?
 When used as an antidote to poisoning by arsenic, how does it act?
 Does this preparation keep well?
 Ferric hydrate with magnesia—How is it made?
 What is its use, and what are its advantages?
 Soluble ferric phosphate—How is it made?
 Is this a definite chemical compound?
 What other salt does it closely resemble?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 Ferric pyrophosphate—How is this made?
 What is this salt chemically?
 In what respect does it differ from the salt which was formerly official?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 —Ferric sulphate—Give Latin name, formula in symbols, and molecular weight.
 What is the British process for making this salt?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 How may the following impurities be detected?—viz.: Ferric salt; copper.
 What is the popular name of the impure ferrous sulphate?
 How much water of crystallization do the crystals contain?
 Dried ferrous sulphate—Give Latin name, formula in symbols, and molecular weight.
 How is it prepared?
 How many parts of the dried salt will one hundred parts of the crystallized salt make?
 Granulated ferrous sulphate—Give Latin name, formula in symbols, and molecular weight.
 Does this differ in composition from "ferri sulphas"?
 How is it prepared?
 What is the use of alcohol in this formula?
 What advantages does this powder possess over the ordinary form of crystals?
 Describe odor, taste, chemical reaction, and solubility.
 How may its quality be tested?
 Ferric valerianate—Give Latin name, formula in symbols, and molecular weight.
 How may this salt be made?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 What is the dose?
 Solution of ferric acetate—Give Latin name.
 How much anhydrous ferric acetate does it contain?
 Ferric acetate—Give formula in symbols and molecular weight.
 How is the solution prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Zinc or copper; fixed alkalies; ferrous salt.
 What is the dose?
 Solution of iron and ammonium acetate—What is the Latin name?
 How is it made? What is its popular name?
 Is this preparation properly named? Why?
 What should it be called?
 What is the dose?
 Solution of ferric nitrate—Give Latin name.
 How much anhydrous ferric nitrate does it contain?
 Ferric nitrate—Give the formula in symbols and the molecular weight.
 How is the solution made? Give description and specific gravity.
 Describe odor, taste, and chemical reaction.
 What is the dose?
 How may its quality be estimated?
 Solution of ferric subsulphate—Give Latin name.
 What synonyms has this solution?
 How much basic ferric sulphate does it contain?

How is it prepared? Give description and specific gravity.
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the following impurities be detected?—viz.: Nitric acid; ferrous salt.
What is the dose?
Solution of ferric tersulphate—What is the Latin name?
What sulphate of iron does this solution contain, and how much?
How is it made? Describe rationale of process.
Wherein does this solution differ from the solution of ferric subsulphate?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the following impurities be detected?—viz.: Nitric acid; ferrous salt.
For what is this solution used?
Chromium—What is its formula in symbols? What is its molecular weight?
How does it occur in nature, and whence is it obtained?
What compounds does it form with oxygen?
What are the tests for chromium salts?
Chromic acid—What is the Latin name?
What is its formula in symbols? What is its molecular weight?
How is it obtained? Describe rationale of process.
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may impurity of sulphuric acid be detected?
What are its uses?
Why should care be used in mixing it with deoxidizing bodies?

CHAPTER XLV.

NICKEL, COBALT, AND TIN.

Ni; 58.6. Co; 58.6. Sn; 118.8.

NEITHER of these metals nor any of their compounds are considered of sufficient medicinal importance to give them a place in the U. S. Pharmacopœia. Their salts are sometimes used medicinally, and two of the metals are important in many respects, particularly in the arts.

Nickel. Ni; 58.6.

This metal is found in magnetic pyrites in Pennsylvania; also as arsenic or *kupfernickel* in Germany and Sweden, and as a silicate in New Caledonia. Its sp. gr. is 8.9. It is a white, malleable metal, and forms with copper a valuable alloy, known as German silver. This alloy is also used for making coins. Salts of nickel are very largely employed in electro-plating, and have come into use as medicines; the Latin name of the metal is *Niccolum*.

Tests for Compounds of Nickel.

1. Ammonium sulphide produces with a solution of a nickel salt a black precipitate (sulphide), insoluble in diluted hydrochloric acid, but soluble in hot nitric acid.

2. Potassium or sodium hydrate produces with nickel salts pale green precipitates of hydroxide insoluble in an excess.

3. Potassium cyanide produces a green precipitate with a solution of a nickel salt, soluble in an excess, but reprecipitated by hydrochloric acid.

Unofficial Salts of Nickel.

Niccoti Bromidum, NiBr_2 .	By dissolving nickel carbonate in hydrobromic acid, concentrating, then crystallizing.
Nickel Bromide.	
Niccoti Carbonas, NiCO_3 .	By heating nickel chloride with an alkaline carbonate in sealed tubes and collecting the powder.
Nickel Carbonate.	
Niccoti Chloridum, NiCl_2 .	By heating nickel filings to low redness in a stream of chlorine.
Nickel Chloride.	
Niccoti Cyanidum, NiCN_2 .	By adding to a solution of potassium cyanide a solution of any nickel salt in slight excess and collecting the precipitate.
Nickel Cyanide.	
Niccoti Sulphas, $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$.	By dissolving pure nickel carbonate in diluted sulphuric acid, concentrating the solution, then crystallizing.
Nickel Sulphate.	

Cobalt. Co; 58.6.

This metal is usually found associated with arsenical ores. It is white, tough, and brittle, unalterable in the air, and strongly magnetic. Sp. gr. 8.5. It forms two classes of salts, cobaltous and cobaltic, in this respect resembling iron. The native ore *skutterudite*,

CoAs_3 , and other cobalt minerals containing arsenic, are often sold in commerce under the name of *flystone*. It is used as a fly-poison by breaking it into small fragments and mixing them with sweetened water. The *chloride* and *sulphocyanate* have been used to make *barometer paper*, by dipping ordinary white paper into a solution and drying it: when dry the color is blue, but an increase of moisture in the air changes the color to pink.

Cobalt forms no official salts, and none of the unofficial salts are of pharmaceutical interest.

Tests for Salts of Cobalt.

1. Ammonium sulphide produces in a solution of a cobaltous salt a black precipitate (sulphide), insoluble in diluted hydrochloric acid.
2. Solution of potassa produces with a solution of a cobaltous salt a blue precipitate, changing by heat first to a violet and subsequently to a red color.
3. Potassium cyanide produces a yellowish-brown precipitate, soluble in an excess; the clear solution after being boiled does not afford a precipitate with hydrochloric acid (difference from nickel salts).

Tin. Sn; 118.8.

The sulphide and oxide are the forms in which tin is usually found. Tin is a valuable white metal, of a silvery color, which, when bent, emits a peculiar crackling sound. Its sp. gr. is 7.3. It forms two classes of compounds, called *stannous* and *stannic* salts. These are not used to any extent in medicine or pharmacy, but are of great importance in the arts.

Tests for Compounds of Tin.

1. Potassium or sodium hydrate produces in a solution of a salt of tin a white precipitate (hydroxide), soluble in an excess.
2. Ammonia water produces a white precipitate (hydroxide) with a solution of a stannous salt, nearly insoluble in an excess. The same reagent with a stannic salt produces a similar white precipitate (hydroxide), slightly soluble in an excess.
3. Ammonium sulphide produces in solutions of stannous salts a brownish-black precipitate, soluble in an excess (if an excess of sulphur be present in the reagent). The yellow sulphide is precipitated from this solution on the addition of an acid. Ammonium sulphide with stannic salts produces a yellow precipitate, soluble in an excess.
4. Mercuric chloride in contact with stannous salts is reduced to mercurous chloride or metallic mercury; no change occurs when it is added to stannic salts.

Unofficial Salts of Tin.

Stanni Chloridum, $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

Stannic Chloride (tin salt).

Stanni Sulphidum, SnS .

Sodii Stannas, Na_2SnO_3 .

Acidum Stannicum, $\text{SnO}_2 \cdot 2\text{H}_2\text{O}$.

Acidum Metastannicum, $5\text{SnO}_2 \cdot 10\text{H}_2\text{O}$.

By dissolving tin in hot hydrochloric acid.

By passing hydrogen sulphide gas into a solution of stannic chloride.

By boiling tin ore with solution of caustic soda.

By precipitating a solution of an alkaline stannate with an acid.

By acting on tin with nitric acid.

CHAPTER XLVI.

LEAD, COPPER, SILVER, AND MERCURY.

Pb; 206.4. Cu; 63.18. Ag; 107.66. Hg; 199.8.

THIS group embraces four well-known metals, which furnish compounds of great value as medicines. They are allied to one another chemically, although they differ greatly in their physical properties.

Lead. Pb; 206.4.

Lead is obtained from the native sulphide, *galena*, by roasting in a reverberatory furnace. It is often associated with silver. It is a heavy, soft, bluish metal, with a specific gravity of 11.45. Lead forms five compounds with oxygen: 1. Suboxide, Pb_2O . 2. Monoxide, PbO . 3. Sesquioxide, Pb_2O_3 . 4. Dioxide, PbO_2 . 5. Triplumbic tetroxide, Pb_3O_4 .

Tests for Compounds of Lead.

1. Hydrogen sulphide or ammonium sulphide precipitates the insoluble black sulphide from salts of lead.
2. Sulphuric acid or a sulphate causes the precipitation of the white sulphate, insoluble in nitric acid.
3. The alkaline carbonates (sodium, potassium, and ammonium) precipitate lead carbonate, insoluble in an excess.

Poisonous Properties of Lead and its Compounds.

Pure water dissolves appreciable quantities of lead through the formation of a slightly soluble hydroxide or carbonate. If traces of sulphates or chlorides be present in the water, an insoluble coating is formed on the surface of the metal, which protects it from further decomposition. Lead pipes and lead tanks for containing drinking-water should be used with care (see U. S. Dispensatory, 17th ed., page 1059).

Official Preparations of Lead.

Official Name.	Preparation.
Plumbi Acetas	Made by treating lead oxide with acetic acid, evaporating, and crystallizing.
Liquor Plumbi Subacetatis	By boiling solution of lead acetate with lead oxide.
Liquor Plumbi Subacetatis Dilutus	By diluting 80 C.c. of solution of lead subacetate with 970 C.c. of water.
Ceratum Plumbi Subacetatis	By mixing 200 Gm. of solution of lead subacetate with 800 Gm. of camphor cerate.

Official Preparations of Lead.—Continued.

Official Name.	Preparation.
Plumbi Carbonas	By acting on metallic lead with fumes of acetic acid and decaying matter.
Unguentum Plumbi Carbonatis	By rubbing 10 Gm. of lead carbonate with 90 Gm. of benzoinated lard.
Plumbi Iodidum	By double decomposition between lead nitrate and potassium iodide.
Unguentum Plumbi Iodidi	By rubbing 10 Gm. of lead iodide with 90 Gm. of benzoinated lard.
Plumbi Nitras	By treating lead oxide with diluted nitric acid, evaporating, and crystallizing.
Plumbi Oxidum	By roasting lead ore in reverberatory furnaces.
Unguentum Diachylon	By diluting lead plaster with olive oil and adding a little oil of lavender.
Emplastrum Plumbi	By boiling lead oxide with olive oil and water.

Unofficial Preparations of Lead.

Plumbi Binoxidum, PbO ₂ . Lead Dioxide.	By treating red lead with diluted nitric acid and collecting the insoluble powder.
Plumbi Bromidum, PbBr ₂ . Lead Bromide.	By making separate solutions of lead acetate and potassium bromide, mixing them, and collecting the precipitate.
Plumbi Chloridum, PbCl ₂ . Lead Chloride.	By dissolving lead acetate in water and adding hydrochloric acid, then collecting the precipitate.
Plumbi Chloris, Pb(ClO ₂) ₂ . Lead Chlorite.	By making separate solutions of lead nitrate and neutral calcium chlorite, mixing them, and collecting the precipitate.
Plumbi Chromas, PbCrO ₄ . Lead Chromate.	By making separate solutions of lead nitrate and potassium bichromate, mixing them, and collecting the precipitate.
Plumbi Oxidum Rubrum, Pb ₂ O ₃ . Red Lead Oxide.	By heating massicot to near 450° C. (840° F.); it gradually combines with the oxygen of the air, which converts it into red lead.
Plumbi Saccharas. Lead Saccharate.	By saturating a solution of saccharic acid in water with freshly precipitated lead carbonate gradually added.
Plumbi Sulphas, PbSO ₄ . Lead Sulphate.	By dissolving lead nitrate in water and adding sulphuric acid, then collecting the precipitate.
Plumbi Tannas. Lead Tannate.	By adding a solution of tannin to one of lead acetate and collecting the precipitate.

PLUMBI ACETAS. U. S. Lead Acetate.

Preparation.—This important salt is made by adding lead oxide to acetic acid and gently heating the mixture until combination takes place.

The commercial salt is unfit for pharmaceutical uses; it is not expected to be pure, and usually contains both carbonate and oxide. The official salt is thus described:

Plumbi Acetas. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, shining, transparent, monoclinic prisms or plates, or heavy, white, crystalline masses, or in granular crystals, efflorescent and attracting carbon dioxide on exposure to air.	Faintly acetous odor; sweetish, astringent, afterwards metallic taste; faintly acid reaction.	At 15° C. (59° F.), 2.3 parts.	At 15° C. (59° F.), 21 parts.
		Boiling, 0.5 part.	Boiling, 1 part.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated to 40° C. (104° F.), the salt loses its water of crystallization (14.25 per cent.). It fuses at 200° C. (392° F.) with the loss of acetic acid, and when strongly heated it is completely decomposed, with the evolution of carbon dioxide and acetone, leaving a residue of finely divided metallic lead mixed with oxide and carbonate.	Carbonate.	A 10-per-cent. solution of the salt, prepared with water which has recently been boiled, should be clear, or only slightly opalescent, and should yield, with potassium ferrocyanide T.S., a pure white precipitate.
On heating the salt with sulphuric acid, vapors of acetic acid are evolved. The aqueous solution of the salt has a slightly acid reaction, and yields a black precipitate with hydrogen sulphide T.S., a yellow one with potassium iodide T.S., and a white one with diluted sulphuric acid.	Iron or Copper.	
	Zinc or Iron.	
	Salts of the Alkalies or of Zinc.	If to the aqueous solution hydrochloric acid be added until no further precipitate is produced, and the remainder of the lead removed from the filtrate by hydrogen sulphide, a portion of the new filtrate should not be affected by the addition of a slight excess of ammonia water. If another portion of the last filtrate be evaporated to dryness, it should leave no residue.

Uses.—Lead acetate is a valuable astringent and sedative: it is used both internally and externally. The dose is from one to three grains (0.06 to 0.18 Gm.). Its solution in water is turbid, due to the formation of a trace of carbonate through the carbonic acid present in the water: this precipitate may be dissolved by the addition of a little acetic acid.

LIQUOR PLUMBI SUBACETATIS. U.S. Solution of Lead Subacetate.

An aqueous liquid, containing in solution about 25 per cent. of Lead Subacetate [approximately $\text{Pb}_3\text{O}(\text{C}_2\text{H}_3\text{O}_2)_4 = 546.48$].

	Metric.	Old form.
Lead Acetate	170 Gm.	8 oz. av. 168 gr.
Lead Oxide	100 Gm.	2 oz. av.
Distilled Water, a sufficient quantity,		
To make	1000 Gm.	1 pint.

Dissolve the Lead Acetate in 800 Gm. [old form 13 fl. oz.] of boiling Distilled Water, in a glass or porcelain vessel. Then add the Lead Oxide, previously passed through a fine sieve, and boil for half an hour, occasionally adding hot Distilled Water to make up the loss by evaporation. Remove the heat, allow the liquid to cool, and add enough Distilled Water, previously boiled and cooled, to make the product weigh 1000 Gm. [old form 1 pint]. Finally, filter the liquid in a closely-covered funnel.

Keep the product in well-stoppered bottles.

The object of this process is to furnish a concentrated solution of a lead compound containing a small proportion of acetic acid. The "subacetate" is not a definite salt, but as found in the official solution it is a mixture of oxyacetates, produced by boiling the normal acetate in water in contact with the oxide.

Liquor Plumbi Subacetatis. U. S.	QUANTITATIVE TEST.
A clear, colorless liquid, odorless, of a sweetish, astringent taste, and an alkaline reaction. On exposure to the air it absorbs carbon dioxide, which causes the formation of a white precipitate. Sp. gr. about 1.195 at 15° C. (59° F.). When added to a solution of acacia, it produces a dense white precipitate (distinction from an aqueous solution of normal lead acetate). In other respects it possesses the reactions given under Lead Acetate (see Plumbi Acetas).	If 13.67 Gm. of the Solution be diluted with 50 C.c. of water, there will be required for complete precipitation of the lead about 25 C.c. of normal sulphuric acid (each C.c. corresponding to 1 per cent. of Lead Subacetate), methyl-orange being used as indicator.

Uses.—This solution, which is frequently termed *Goulard's Extract*, is sedative and astringent: it is employed externally as an application to inflamed surfaces.

LIQUOR PLUMBI SUBACETATIS DILUTUS. U. S. Diluted Solution of Lead Subacetate.

[LEAD WATER.]

	Metric.	Old form.
Solution of Lead Subacetate	30 C.c.	460 minims.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	2 pints.

Mix the Solution of Lead Subacetate with enough Distilled Water, previously boiled and cooled, to make the product measure 1000 C.c. [old form 2 pints].

Keep the Solution in well-stoppered bottles.

This solution is opalescent, through the formation of a trace of carbonate, if the distilled water used has not been recently boiled and cooled, the object of which is to deprive the water of carbonic acid gas. The addition of a few drops of acetic acid clears the solution by dissolving the precipitate; but, as many serious errors have occurred through the internal use by patients of lead water in mistake for lime water, it is a good practice to dispense lead water in a slightly opalescent condition and lime water always as a transparent liquid, and, as an additional safeguard, to use blue poison bottles for the lead water.

Uses.—Lead water is used as a soothing application to inflamed surfaces.

CERATUM PLUMBI SUBACETATIS. U. S. Cerate of Lead Subacetate.

[GOULARD'S CERATE.]

This cerate is made by mixing 20 Gm. of solution of lead subacetate with 80 Gm. of camphor cerate. It possesses the sedative and astringent properties of the lead solution. It may be prevented from assuming a yellow color by the addition of a trace of acetic acid (see Part V.).

PLUMBI CARBONAS. U. S. Lead Carbonate.

[WHITE LEAD.]

Lead carbonate should be kept in well-closed vessels.

Preparation.—This compound of lead may be made by mixing solutions of lead nitrate and sodium carbonate. It is manufactured

on an immense scale for use in the arts by exposing lead to the action of the air, acetic acid, and carbon dioxide, and by other methods.

Plumbi Carbonas. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, white, opaque powder or pulverulent mass, permanent in the air. When strongly heated, the salt turns yellow, without charring, and, if heated in contact with charcoal, is reduced to metallic lead.	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in acetic or diluted nitric acid, with effervescence.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
This solution yields a black precipitate with hydrogen sulphide T.S., a yellow one with potassium iodide T.S., and a white one with diluted sulphuric acid. If 1 Gm. of the salt be strongly ignited, in a porcelain crucible, it should leave a residue of lead oxide weighing not less than 0.85 Gm.	Zinc, Alkalies, or Alkaline Earths. Insoluble Foreign Salts.	On completely precipitating the solution of the salt with hydrogen sulphide, the filtrate should not leave more than a trifling residue on evaporation. If 2 Gm. of the salt be dissolved in a mixture of 2 C.c. of nitric acid and 10 C.c. of water, it should not leave more than 0.2 Gm. of residue.		

Uses.—Lead carbonate is employed externally in the form of an ointment, and is popularly used as a cosmetic. Its use is dangerous, however, owing to the risk from absorption. It was formerly used in solution of gutta-percha to clarify it, by aiding in carrying down mechanical impurities by its weight. When ground in oil this salt of lead is largely used as a paint; it is also employed occasionally in this form as an application to inflamed surfaces.

It is rarely administered internally.

UNGUENTUM PLUMBI CARBONATIS. U.S. Ointment of Lead Carbonate.

This ointment is made by rubbing 10 Gm. of lead carbonate with 90 Gm. of benzoinated lard. It is used as a soothing application to inflamed surfaces.

PLUMBI IODIDUM. U.S. Lead Iodide.

PbI_2 ; 459.46.

Preparation.—This Iodide may be made by the British process:

Take of Nitrate of Lead, Iodide of Potassium, each, 4 oz. av.; Distilled Water a sufficiency. Dissolve the Nitrate of Lead, by the aid of heat, in a pint and a half, and the Iodide of Potassium in half a pint, of the Water, and mix the solutions. Collect the precipitate on a filter, wash it with Distilled Water, and dry it at a gentle heat.

This is an instance of double decomposition, lead iodide and potassium nitrate being formed. The nitrate is preferred to the acetate,

because lead iodide is more soluble in solution of potassium acetate than in that of potassium nitrate.

Plumbi Iodidum. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, bright yellow powder, permanent in the air. When moderately heated, the salt fuses to a thick reddish-brown liquid, which congeals, on cooling, to a yellow, crystalline mass. When strongly heated, the salt fuses, and at a higher temperature it is decomposed, emitting violet vapors of iodine, and leaving a citron-yellow residue of lead oxyiodide.	Odorless; tasteless; neutral reaction.	At 15° C. (59° F.), 2000 parts. Boiling, 200 parts. Separating from the latter solution in brilliant, golden-yellow spangles or crystalline laminæ.	Very slightly soluble.	Soluble without color in solutions of the fixed alkalies, and in concentrated solutions of the acetates of the alkalies, potassium iodide, sodium hyposulphite, and in a hot solution of ammonium chloride.

IMPURITIES.

TESTS FOR IMPURITIES.

Chromate and other Insoluble Foreign Salts.	{	If 1 Gm. of the salt be triturated with 2 Gm. of ammonium chloride and 2 C.c. of water, a nearly white mixture will result. If this be transferred to a test-tube, and heated in a water-bath for a few minutes, a clear and almost colorless solution should be formed. On cooling this solution, a solid mass of nearly colorless, fine silky crystals is produced, and on adding water or diluted sulphuric acid to this mass, yellow lead iodide will be separated.
Nitrate.		If 1 Gm. of the salt be boiled for a few minutes with 20 C.c. of water, the mixture then cooled and filtered, the lead removed from the filtrate by hydrogen sulphide, and the new filtrate somewhat concentrated by evaporation, a portion of this liquid, when mixed with a little sulphuric acid and tinted with a drop of indigo T.S., should not become decolorized on heating.
Acetate.		If another portion of the liquid be carefully neutralized with ammonia water, it should not become colored red by a drop of ferric chloride T.S.
Soluble Foreign Salts.	{	If the remainder of the filtrate be evaporated to dryness, it should leave no residue.

Uses.—Lead iodide is used principally to form an official ointment. It may be given internally in doses of one to three grains (0.06 to 0.18 Gm.).

UNGUENTUM PLUMBI IODIDI. U.S. Ointment of Lead Iodide.

This ointment is made by rubbing 10 Gm. of lead iodide with 90 Gm. of benzoinated lard. It is used as an application to tumors and indolent swellings.

PLUMBI NITRAS. U.S. Lead Nitrate.

Preparation.—This salt may be easily made by adding lead oxide to equal parts of nitric acid and water, heating the mixture until the solution is effected, and, after filtering, evaporating the solution of lead nitrate and crystallizing.

Plumbi Nitræs. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, octohedral crystals, when obtained by the spontaneous evaporation of cold solutions, or white, nearly opaque crystals, when formed by the cooling of hot solutions, permanent in the air. When strongly heated, the salt decrepitates, emits nitrous vapors, and finally leaves a residue of lead oxide.	Odorless; sweetish, astringent, afterwards metallic taste; acid reaction.	At 15° C. (59° F.), 2 parts. Boiling, 0.75 part.	Almost insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The aqueous solution of the salt yields a black precipitate with hydrogen sulphide T.S., a white one with diluted sulphuric acid, and a yellow one with potassium iodide T.S.	Iron or Copper. { Zinc or Iron. { Salts of the Alkalies or of Zinc. {	A 10-per-cent. aqueous solution of the salt should give, with potassium ferrocyanide T.S., a pure white precipitate. If hydrochloric acid be added to the aqueous solution until no further precipitate is produced, and the remainder of the lead be removed from the filtrate by hydrogen sulphide, a portion of the new filtrate should not be affected by the addition of a slight excess of ammonia water. If another portion be evaporated to dryness, it should leave no residue.

Uses.—Lead nitrate is used in solution principally as an external application to excoriated surfaces.

PLUMBI OXIDUM. U. S. Lead Oxide.

PbO; 222.86.

[LITHARGE.]

Preparation.—Litharge is lead oxide which has been rendered semi-crystalline by incomplete fusion. Almost all the litharge of commerce is obtained as a secondary product in the process for extracting silver from argentiferous galenas. After extracting the lead from the ore, the alloy is calcined in the open air; whereby the lead becomes oxidized, and by fusion passes into the state of litharge, while the silver remains unchanged.

Red lead is a higher oxide, Pb_3O_4 ; 683.04, and is made by sprinkling hot litharge with water, powdering and drying it, and then heating it out of contact with air. Litharge is officially described as follows:

Plumbi Oxidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, yellowish or reddish-yellow powder, or minute scales. On exposure to the air it slowly absorbs moisture and carbon dioxide. When heated, the Oxide assumes a brownish-red color, becoming yellow again on cooling. It fuses at a red heat. When heated in contact with charcoal, it is reduced to metallic lead.	Odorless; tasteless; faintly alkaline reaction.	Almost insoluble.	Insoluble.	Soluble in acetic and diluted nitric acids, and in warm solutions of the fixed alkalies.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The diluted and filtered solution of the salt yields a black precipitate with hydrogen sulphide T.S., a white one with diluted sulphuric acid, soluble in a strong solution of sodium hydrate, and a yellow one with potassium iodide T.S.	Carbonate. Silicate, Barium Sulphate, etc. Copper. Iron. More than 1.5 per cent. of Insoluble Impurities. Carbonate and Moisture.	Lead Oxide should be soluble in diluted nitric acid with but little effervescence, And without the development of the odor of nitrous acid, leaving not more than a trifling residue. If from the solution in diluted nitric acid the lead be precipitated by sulphuric acid, the filtrate, after the addition of an excess of ammonia water, should not assume more than a slight bluish tint, Nor yield more than traces of a reddish-yellow precipitate. If 5 Gm. of the Oxide contained in a small flask be shaken with 5 C.c. of water, then 20 C.c. of acetic acid added, and the mixture boiled for a few minutes and filtered, the insoluble residue, when well washed and dried, should not weigh more than 0.075 Gm. When strongly heated, in a porcelain crucible, the Oxide should not lose more than 2 per cent. of its weight.

EMPLASTRUM PLUMBI. U.S. Lead Plaster.

[DIACHYLON PLASTER.]

This compound of lead is made by boiling lead oxide with olive oil and water, whereby the lead enters into combination with the fatty acids of the oil; it is a lead oleo-palmitate. (See Glycerinum.) It is used as the basis of many plasters.

UNGUENTUM DIACHYLON. U.S. Diachylon Ointment.

This ointment is simply lead plaster diluted with olive oil to the consistence of an ointment and slightly perfumed with oil of lavender. (See Unguenta.) It is used externally in several skin diseases.

Copper. Cu; 63.18.

Copper is found naturally in its metallic condition, as a sulphide or oxide, and as a sulphate, carbonate, phosphate, or arsenate. It is a brilliant metal, of a red color, having a sp. gr. of 8.92 to 8.95. It forms two oxides: 1. Red cuprous oxide, Cu_2O , and, 2. Black cupric oxide, CuO .

Tests for Compounds of Copper.

1. Hydrogen sulphide or ammonium sulphide produces a black precipitate of cupric sulphide.

2. Ammonia water produces in concentrated solutions of copper salts a pale blue precipitate of cupric hydroxide, in dilute solutions a deep blue coloration.

3. Potassium ferrocyanide produces a reddish-brown precipitate of cupric ferrocyanide.

4. A bright surface of metallic iron or zinc immersed in an acidulated solution of a copper salt is coated with metallic copper.

5. Copper salts color the flame of an alcohol lamp or Bunsen burner green.

Official Preparation of Copper.

Official Name.	Preparation.
Cupri Sulphas . . .	By treating copper with diluted sulphuric acid, evaporating the solution, and crystallizing.

Unofficial Preparations of Copper.

Cupri Acetas. Copper Acetate.	By treating copper with acetic acid and purifying the product by crystallisation.
Cupri Arsenas, $\text{Cu}_3\text{As}_2\text{O}_8$. Copper Arsenate.	By adding a solution of copper sulphate to a solution of disodic arsenate, and collecting and drying the precipitate.
Cupri Bromidum, CuBr_2 . Copper Bromide.	By evaporating a solution of cupric oxide in aqueous hydrobromic acid, and fusing the residue at a gentle heat.
Cupri Citras. Copper Citrate.	By heating a solution of cupric acetate with citric acid and setting aside to crystallize.
Cupri Nitras, $\text{Cu}(\text{NO}_3)_2$. Copper Nitrate.	By dissolving metallic copper in nitric acid and concentrating the solution, then crystallising.
Cupri Oxidum, CuO . Cupric Oxide.	By continued ignition of copper in contact with air.
Cupri Subacetas, $\text{Cu}(\text{HO})_2$. $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$. Verdigris.	Made by acting on sheets of copper with acetic acid.
Cupri Tartras. Copper Tartrate.	By adding a solution of neutral potassium tartrate to a solution of cupric sulphate and collecting the precipitate.

CUPRI SULPHAS. *U. S.* Copper Sulphate.

[CUPRIC SULPHATE.]

Preparation.—This salt is economically made by acting on scrap copper with diluted sulphuric acid, heating, evaporating the solution, and crystallizing.

Cupri Sulphas. <i>U. S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Large, translucent, deep blue, triclinic crystals, efflorescent in dry air. When carefully and continuously heated to 30° C. (86° F.), the salt loses two of its five molecules of water (14.43 per cent.), and is converted into a pale blue, amorphous powder. Two more molecules of water are lost at 100° C. (212° F.), while the fifth is retained until 200° C. (392° F.) is reached, when a white anhydrous powder remains (63.9 per cent. of the original weight). At a still higher temperature sulphur dioxide and oxygen are given off, and a residue of black cupric oxide is left. If a drop of the solution be placed on a bright piece of iron, it will produce a red stain of metallic copper.	Odorless; nauseous, metallic taste; acid reaction.	At 15° C. (59° F.), 2.6 parts. Boiling, 0.5 part.	Almost insoluble.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
Barium chloride T.S. yields a white precipitate, insoluble in hydrochloric acid. With potassium ferrocyanide T.S. the solution yields a deep reddish-brown precipitate.	<div>Iron, Alumi- num, and Al- kaline Earths.</div> <div>Iron, Alumi- num.</div> <div>Arsenic, Lead, Zinc, etc.</div>	<p>If a little hydrochloric and some diluted sulphuric acid be added to 10 C.c. of the aqueous solution of the salt, and this be treated with hydrogen sulphide gas until the copper is completely precipitated, the filtrate should not leave more than a trace of residue on evaporation.</p> <p>If ammonia water be added to the solution, drop by drop, a pale blue precipitate of cupric hydrate is formed, which redissolves in an excess of ammonia water, forming a deep azure-blue solution, leaving no trace of residue undissolved.</p> <p>If the aqueous solution (1 in 20) be heated to boiling with an excess of sodium hydrate T.S. until all of the copper has been converted into black cupric oxide, it will yield a filtrate which, after acidulation with acetic acid, should not be colored or rendered turbid by an equal volume of hydrogen sulphide T.S.</p>

Uses.—Copper sulphate, called commercially *blue vitriol*, is used internally as an emetic in doses of five grains (0.3 Gm.); as an astringent or tonic, from one-quarter to one-half grain (0.016 to 0.03 Gm.) is given. It is used as an injection in gonorrhoea and other diseases, and also as a stimulant wash, and in substance as an escharotic.

Silver. Ag; 107.66.

Silver is found in the metallic state, but usually as a sulphide, and associated with lead sulphide, or *galena*.

Silver is a brilliant white metal, very malleable and ductile, having a sp. gr. of 10.4 to 10.5. It forms but one oxide, Ag_2O .

Tests for Silver Salts.

1. Hydrochloric acid or any soluble chloride produces with a soluble salt of silver a characteristic, curdy, white precipitate of silver chloride, which is insoluble in hot nitric acid, but soluble in ammonia water.

2. Hydrogen sulphide or ammonium sulphide produces a black precipitate of silver sulphide.

3. Caustic alkalies produce a brown precipitate of silver oxide.

Official Preparations of Silver.

Official Name.	Preparation.
Argenti Cyanidum . . .	By passing hydrocyanic acid gas into solution of silver nitrate.
Argenti Iodidum . . .	By double decomposition between potassium iodide and silver nitrate.
Argenti Nitras	By treating metallic silver with nitric acid, evaporating the solution, and crystallizing.
Argenti Nitras Dilutus .	By fusing equal parts of silver nitrate and potassium nitrate.
Argenti Nitras Fusus .	By fusing and moulding silver nitrate.
Argenti Oxidum	By precipitating solution of silver nitrate with solution of potassa.

Unofficial Preparations of Silver.

Argenti Acetas, $\text{AgC}_2\text{H}_3\text{O}_2$. Silver Acetate.	By adding a solution of silver nitrate to a solution of sodium acetate, then collecting and drying the precipitate.
Argenti Bromidum, AgBr . Silver Bromide.	By adding to a solution of silver nitrate a solution of potassium bromide, then collecting and drying the precipitate.
Argenti Chloridum, AgCl . Silver Chloride.	By adding to a solution of silver nitrate hydrochloric acid as long as a precipitate is produced, then collecting and drying the precipitate.
Argenti Chromas, Ag_2CrO_4 . Silver Chromate.	By adding a solution of neutral potassium chromate to a solution of silver nitrate, then collecting and drying the precipitate.
Argenti Lactas, $\text{AgC}_3\text{H}_5\text{O}_2 \cdot \text{H}_2\text{O}$. Silver Lactate.	By boiling silver carbonate with lactic acid, and collecting and drying the precipitate.
Argenti Oxalas, $\text{Ag}_2\text{C}_2\text{O}_4$. Silver Oxalate.	By adding a solution of oxalic acid to a solution of silver nitrate, and collecting and drying the precipitate.
Argenti Phosphas, Ag_3PO_4 . Silver Phosphate.	By adding a solution of silver nitrate to a solution of sodium phosphate, and collecting and drying the precipitate.
Argenti Sulphas, Ag_2SO_4 . Silver Sulphate.	By adding a solution of silver nitrate to a solution of sodium sulphate, and collecting and drying the precipitate.

ARGENTI CYANIDUM. U. S. Silver Cyanide.

AgCN; 138.64.

Preparation.—Silver cyanide is easily prepared by passing hydrocyanic acid gas into a solution of silver nitrate, or by mixing solutions of potassium cyanide and silver nitrate.

Argenti Cyanidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white powder, permanent in dry air, but gradually turning brown by exposure to light.	Odorless; tasteless.	Insoluble.	Insoluble.	Insoluble in cold but soluble in boiling nitric acid, with evolution of hydrocyanic acid; soluble in ammonia water and in solution of sodium hyposulphite.

TEST FOR IDENTITY.

When heated, the salt fuses, gives off cyanogen gas, and, on ignition, leaves a residue of metallic silver amounting to 86.56 per cent. of its original weight.

Silver cyanide should be kept in dark amber-colored vials, protected from light.

Uses.—This salt was made official to use in the extemporaneous preparation of hydrocyanic acid. (See Acidum Hydrocyanicum Dilutum.)

ARGENTI IODIDUM. U. S. Silver Iodide.

AgI; 284.19.

Preparation.—This iodide may be made by double decomposition between potassium iodide and silver nitrate.

Silver iodide should be kept in dark amber-colored vials, protected from light.

Argenti Iodidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, amorphous, light yellowish powder, unaltered by light, if pure, but generally becoming greenish-yellow. When heated to about 400° C. (752° F.), it melts to a dark red liquid, which, on cooling, congeals to a soft, yellow, slightly transparent mass.	Odorless; tasteless.	Insoluble.	Insoluble.	Insoluble in diluted acids or in solution of ammonium carbonate; soluble in about 2500 parts of stronger ammonia water.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When mixed with ammonia water, it turns white, but regains its yellowish color by washing with water. It is also dissolved by an aqueous solution of potassium cyanide, and by a concentrated solution of potassium iodide, and the resulting solutions yield a black precipitate with hydrogen sulphide T.S. or ammonium sulphide T.S. If a small quantity of chlorine water be agitated with an excess of the salt, the filtrate acquires a dark blue color on the addition of starch T.S.	<p>Chloride.</p> <p>Bromide.</p>	<p>If 0.5 Gm. of the salt be digested for five minutes with 10 C.c. of a cold 15-per-cent. solution of ammonium carbonate, the filtrate, when supersaturated with nitric acid, should not be rendered more than faintly opalescent.</p> <p>On digesting a portion of the salt—which has been found to be free from chloride, or from which the latter has been completely removed by repeated digestion with ammonium carbonate—for five minutes with 10 C.c. of ammonia water, and supersaturating the filtrate with nitric acid, only a slight opalescence, but no yellowish-white precipitate, should be produced.</p>

Uses.—Silver iodide has been used in syphilis, in doses of one-half grain to two grains (0.03 to 0.13 Gm.).

ARGENTI NITRAS. U. S. Silver Nitrate.

AgNO_3 ; 169.55.

Preparation.—This valuable salt may be made by the former official process:

Take of Silver, in small pieces, 2 oz. troy; Nitric Acid $2\frac{1}{2}$ oz. troy; Distilled Water a sufficient quantity. Mix the Acid with a fluidounce of Distilled Water in a porcelain capsule, add the Silver to the mixture, cover it with an inverted glass funnel, resting within the edge of the capsule, and apply a gentle heat until the metal is dissolved, and red vapors cease to be produced; then remove the funnel, and, increasing the heat, evaporate the solution to dryness. Melt the dry mass, and continue the heat, stirring constantly with a glass rod, until free nitric acid is entirely dissipated. Dissolve the melted salt, when cold, in six fluidounces of Distilled Water, allow the insoluble matter to subside, and decant the clear solution. Mix the residue with a fluidounce of Distilled Water, filter through paper, and, having added the filtrate to the decanted solution, evaporate the liquid until a pellicle begins to form, and set it aside in a warm place to crystallize. Lastly, drain the crystals in a glass funnel until dry, and preserve them in a well-stopped bottle. By evaporating the mother-water, more crystals may be obtained.

The silver employed is usually coin, and this always contains copper: hence copper nitrate is present, which is known by the bluish color of the solution. By evaporating the solution and fusing the residue the copper salt is decomposed and the insoluble copper oxide produced; by solution and filtration this is separated, and the purified solution of silver nitrate is evaporated and crystallized.

<i>Argentum Nitras. U.S.</i>	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent, tabular, rhombic crystals, becoming gray or grayish-black on exposure to light in presence of organic matter.	Odorless; bitter, caustic, and strongly metallic taste; neutral reaction.	At 15° C. (59° F.), 0.6 part. Boiling, 0.1 part.	Cold, 26 parts. Boiling, 5 parts.
TESTS FOR IDENTITY AND QUANTITATIVE TEST.		IMPU- RITIES. TESTS FOR IMPURITIES	
When heated to about 200° C. (392° F.), the salt fuses to a faintly yellow liquid, which, on cooling, congeals to a purely white, crystalline mass. At a higher temperature the salt is gradually decomposed, with evolution of nitrous vapors. An aqueous solution of the salt yields, with hydrochloric acid, a white precipitate soluble in ammonia. 0.34 (0.3391) Gm. of Silver Nitrate, dissolved in 10 C.c. of water, should require, for complete precipitation, 20 C.c. of decinormal sodium chloride V.S. (corresponding to 100 per cent. of the pure salt).		Foreign Salts.	If all the silver be precipitated with hydrochloric acid, and the filtrate be evaporated to dryness, no fixed residue should be left. If 5 C.c. of a 10-per-cent. aqueous solution of the salt be mixed with 20 C.c. of diluted sulphuric acid, and heated to boiling, no turbidity should be perceptible.
		Lead.	

Uses.—Silver nitrate is used externally as a caustic and escharotic; internally, it is given in gastritis and diarrhoea, in doses of one-fourth to one-half grain (0.016 to 0.032 Gm.).

ARGENTI NITRAS DILUTUS. U.S. Diluted Silver Nitrate.

[MITIGATED CAUSTIC.]

	Metric.	Old form.
Silver Nitrate	30 Gm.	1 oz. av.
Potassium Nitrate	60 Gm.	2 oz. av.

Melt the salts together in a porcelain crucible, at as low a temperature as possible, stirring the melted mass well until it flows smoothly. Then cast it into suitable moulds. Keep the product in dark amber-colored vials.

This preparation contains now 33.3 per cent. of silver nitrate, instead of 50 per cent. as in the U. S. P. 1880.

Uses.—The object of this preparation is to provide a fused silver nitrate, which may often be useful where the undiluted caustic might prove too severe in its action.

<i>Argentum Nitras Dilutus. U.S.</i>	TESTS.
A white, hard solid, generally in form of pencils or cones of a finely granular fracture, becoming gray or grayish-black on exposure to light in presence of organic matter. Odorless, having a caustic, metallic taste and a neutral reaction. Each of its constituents retains the solubility in water and in alcohol mentioned respectively under <i>Argentum Nitras</i> and <i>Potassium Nitras</i> .	If 1 Gm. of Diluted Silver Nitrate, dissolved in 10 C.c. of water, be mixed with 20 C.c. of decinormal sodium chloride V.S., and a few drops of potassium chromate T.S., not more than 0.5 C.c. of decinormal silver nitrate V.S. should be required to impart to the liquid a permanent red color (corresponding to at least 33 per cent. of pure silver nitrate). An aqueous solution of Diluted Silver Nitrate yields, with a slight excess of hydrochloric acid, a white precipitate, which is readily soluble in ammonia water. The filtrate from this precipitate, when evaporated to dryness, leaves a white residue which is completely soluble in water, and which yields a yellow, crystalline precipitate with platinum chloride T.S., and a white, crystalline precipitate with sodium bitartrate T.S.

IMPURITIES.	TESTS FOR IMPURITIES.
Copper.	{ If to an aqueous solution of Diluted Silver Nitrate a slight excess of ammonia water be added, it should not assume a blue color.
Lead and Bismuth.	{ If to an aqueous solution of Diluted Silver Nitrate a slight excess of ammonia water be added, it should not show any turbidity.

Uses.—This preparation is used only externally. It is similar in its action to the moulded nitrate, but less energetic.

ARGENTI NITRAS FUSUS. U.S. Moulded Silver Nitrate.

[LUNAR CAUSTIC.]

	Metric.	Old form.
Silver Nitrate	100 Gm.	1 oz. av.
Hydrochloric Acid	4 Gm.	16 minima.

To the Silver Nitrate, contained in a porcelain capsule, add the Hydrochloric Acid, and melt the mixture at as low a temperature as possible. Stir well, and pour the melted mass into suitable moulds.

Keep the product in dark amber-colored vials, protected from light.

When pure fused silver nitrate is cooled, the mass is very brittle, but the addition of hydrochloric acid produces sufficient silver chloride to

FIG. 351.

Caustic point mould.

toughen it, so that the cast cones or sticks will not break so easily. In order to keep the sticks from becoming discolored during the casting process, it is advisable to add a little diluted nitric acid (1 in 5) occasionally to the melted nitrate, and carefully prevent

the mass from becoming overheated. Fig. 351 illustrates the silver moulds used in moulding the cones.

Argenti Nitræ Fusus. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A white, hard solid, generally in form of pencils or cones of a fibrous fracture, becoming gray or grayish-black on exposure to light in presence of organic matter.	Odorless; bitter, caustic, and strongly metallic taste; neutral reaction.	At 15° C. (59° F.), Soluble, with the exception of about 5 per cent. of silver chloride, in 0.6 part.	Cold, Soluble, with the exception of about 5 per cent. of silver chloride, in 26 parts.	Whatever is left undissolved by water is completely soluble in ammonia water.
		Boiling, Soluble, with the exception of about 5 per cent. of silver chloride, in 0.1 part.	Boiling, Soluble, with the exception of about 5 per cent. of silver chloride, in 5 parts.	

TEST FOR IDENTITY AND QUANTITATIVE TEST.

A clear, aqueous solution of the salt, decanted from the insoluble portion, should be neutral to litmus paper, and it should respond to the tests of identity and purity mentioned under *Argenti Nitras*.

If 0.34 Gm. of moulded Silver Nitrate, dissolved as completely as possible in 10 C.c. of water, be mixed with 20 C.c. of decinormal sodium chloride V.S. and a few drops of potassium chromate T.S., not more than 1 C.c. of decinormal silver nitrate V.S. should be required to impart to the liquid a permanent red color (corresponding to 95 per cent. of pure silver nitrate).

Uses.—Moulded silver nitrate is used as an escharotic: a good caustic-holder may be made from a glass stirring-rod of the same diameter as the cone by joining it to the cone with a short length of rubber tubing. The cone may be protected from the action of the air by slipping over it another short length of rubber tubing, having a very short piece of glass rod in the other end as a stopper.

Death has resulted more than once through the careless use of silver nitrate in cauterizing the throat, the cone having slipped out of the holder and then been swallowed by the patient.

ARGENTI OXIDUM. U. S. Silver Oxide.

Ag_2O ; 231.23.

Preparation.—This salt may be made by a former official process:

Take of Nitrate of Silver 4 oz. troy; Distilled Water half a pint; Solution of Potassa $1\frac{1}{2}$ pints, or a sufficient quantity. Dissolve the Nitrate of Silver in the Water, and to the solution add Solution of Potassa so long as it produces a precipitate. Wash this repeatedly with water until the washings are nearly tasteless. Lastly, dry the precipitate and keep it in a well-stopped bottle, protected from the light.

Argenti Oxidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
A heavy, dark brownish-black powder, liable to reduction by exposure to light. When heated to about 250° to 300° C. (482° to 572° F.), it loses oxygen, and metallic silver is left behind.	Odorless; metallic taste; imparts an alkaline reaction to water.	Very slightly soluble.	Insoluble.
TESTS.	IMPURITY.	TEST FOR IMPURITY.	
The solution of the Oxide should be colorless, and should respond to the reactions and tests mentioned under <i>Silver Nitrate</i> (see <i>Argenti Nitras</i>). If 0.5 Gm. of the Oxide be ignited in a porcelain crucible, it should yield 0.465 Gm. (or 93.1 per cent.) of metallic silver.	Carbonate.	{ On adding Silver Oxide to nitric acid, no effervescence should take place.	

Uses.—Silver oxide is used as a substitute for silver nitrate, being much less caustic than the latter, and better suited for internal use, owing to the facility with which it parts with its oxygen. Silver oxide should not be triturated with readily oxidizable or combustible substances, and should not be brought in contact with ammonia. The dose is one grain (0.065 Gm.).

Gelatin capsules are well fitted for dispensing this compound. With most excipients decomposition ensues, and the pills have been known to explode with some violence.

Mercury. Hg; 199.8.

Mercury, or quicksilver, is found most abundantly as sulphide, or *cinnabar*: the principal mines are in Spain and California. It is a brilliant, silver-white metal, liquid above -40° C. (-40° F.), and having the sp. gr. 13.5584. Mercury forms two series of compounds,—*mercurous*, containing the group (Hg_2), and *mercuric*, containing the single atom Hg. It is used more largely in medicine in the metallic state than any other element.

Tests for Compounds of Mercury.

1. Ammonium sulphide or hydrogen sulphide, in excess, produces a black precipitate (sulphide) in solutions of salts of mercury.
2. Potassium iodide produces with mercurous salts a green precipitate of mercurous iodide, or with mercuric salts a red precipitate of mercuric iodide, soluble in excess.
3. With hydrochloric acid or soluble chlorides a white precipitate of mercurous chloride is produced with mercurous salts, whilst with mercuric salts no precipitation occurs.
4. A plate of copper or a solution of stannous chloride, in excess, precipitates the metal from its soluble combinations.

Hydrargyri Acetas. Mercuric Acetate.	By dissolving mercuric oxide in acetic acid, filtering, and concentrating to crystallize.
Hydrargyri Arsenas. Mercuric Arsenate.	By adding a solution of arsenic acid to a solution of mercuric nitrate, and collecting the precipitate.
Hydrargyri Bromidum, HgBr ₂ . Mercuric Bromide.	By dissolving mercuric oxide in hot aqueous hydrobromic acid, filtering and concentrating, then crystallizing.
Hydrargyri Carbonas, Hg ₂ CO ₃ . Mercurous Carbonate.	By precipitating a solution of mercurous nitrate with acid potassium carbonate, and collecting the precipitate.
Hydrargyri Chloras, Hg(ClO ₃) ₂ + H ₂ O. Mercuric Chlorate.	By dissolving mercuric oxide in warm chloric acid, filtering and concentrating, then crystallizing.
Hydrargyri Chromas, HgCrO ₄ . Mercuric Chromate.	By boiling equal parts of chromic acid and yellow mercuric oxide in water, and collecting the red crystals.
Hydrargyri Lactas, (Hg ₂) ₂ (C ₃ H ₅ O ₂) ₂ ·2H ₂ O. Mercurous Lactate.	By mixing boiling solutions of sodium lactate and mercurous nitrate, and collecting the precipitate.
Hydrargyri Sulphidum Rubrum, HgS. Hydrargyri Nitras, Hg ₂ (NO ₃) ₂ ·2H ₂ O. Mercurous Nitrate.	By fusing and subliming mercury and sulphur. By mixing 4 p. mercury, 3 p. nitric acid, 1 p. water, and after twenty-four hours collecting the crystals.
Hydrargyri Sulphas, HgSO ₄ . Mercuric Sulphate.	By heating 10 oz. mercury with 6 fl. oz. sulphuric acid, in a porcelain vessel, and stirring constantly until a white salt is obtained.

HYDRARGYRUM. U. S. Mercury.

Hg; 199.8. [QUICKSILVER.]

Mercury for pharmaceutical uses should be pure. To separate mechanical impurities, moisture, or small quantities of oxide, mercury may be filtered by collecting it in a sound piece of chamois leather and

gathering the corners together, forcibly squeezing the particles through the pores of the leather. But distillation is preferable in most cases to purify the metal effectually, which may be accomplished by a process formerly official in the British Pharmacopœia, as follows:

Take of Mercury of Commerce 3 pounds [avoirdupois]; Hydrochloric Acid 3 fluidrachms; Distilled Water a sufficiency. Place the Commercial Mercury in a glass retort or iron bottle, and, applying heat, cause two pounds and a half of the metal to distil over into a flask employed as a receiver. Boil on this for five minutes the Hydrochloric Acid diluted with 9 fluidrachms of Distilled Water, and having, by repeated affusions of Distilled Water and decantations, removed every trace of acid, let the mercury be transferred to a porcelain capsule, and dried first by filtering paper, and finally on a water-bath.

Hydrargyrum. U. S.	IMPURITIES.	TESTS FOR IMPURITIES.
A shining, silver-white metal, liquid at temperatures above -40° C. (-40° F.), odorless and tasteless, and insoluble in ordinary solvents, also in concentrated hydrochloric acid, and at common temperatures in sulphuric acid,—but it dissolves in the latter when boiled with it; soluble in nitric acid without residue. Sp. gr. 13.5584 at 15° C. (59° F.). At the common temperature it volatilizes very slowly, more rapidly as the temperature increases, and at 357.25° C. (675.05° F.) it boils, being finally volatilized without residue, yielding a colorless and very poisonous vapor.	Tin and other Metals.	When globules of Mercury are dropped upon white paper, they should roll about freely, retaining their globular form and leaving no streaks or traces.
	Moisture.	Mercury should be perfectly dry.
	Organic Impurities.	Mercury should present a bright surface.
	More than slight traces of Foreign Metals.	On boiling 5 Gm. of distilled water with 5 Gm. of Mercury and 4.5 Gm. of sodium hyposulphite in a test-tube for about one minute, the mercury should not lose its lustre, and should not acquire more than a slightly yellowish shade.

Uses.—When mercury is administered in a finely divided condition, as in blue mass, or in mercury with chalk, it exerts a peculiar action on the liver, which is termed alterative. This action is possessed by some of its salts.

MASSA HYDRARGYRI. U. S. Mass of Mercury.

[PILULÆ HYDRARGYRI. BLUE MASS. BLUE PILL.]

	Metric.	Old form.
Mercury	33 Gm.	5 oz. av. 122 gr.
Glycyrrhiza, in No. 60 powder	5 Gm.	850 gr.
Althæa, in No. 60 powder	25 Gm.	4 oz. av.
Glycerin	3 Gm.	8 fl. dr.
Honey of Rose	34 Gm.	4½ fl. oz.
To make	100 Gm.	16 oz. av.

Triturate the Mercury with the Honey of Rose and Glycerin until it is extinguished. Then gradually add the Glycyrrhiza and Althæa, and continue the trituration until globules of Mercury are no longer

visible under a lens magnifying at least ten diameters. (See tests under *Hydrargyrum cum Creta*.)

By using this formula the pharmacist is enabled to make blue mass extemporaneously with very little labor. The mass should not be *forcibly pressed*, or the globules of mercury will run together, and will grow larger instead of smaller.

Uses.—The object of this preparation is to furnish mercury in a finely divided condition. It is given to produce salivation in small doses, and in doses of three to ten grains (0.19 to 0.64 Gm.) as an alterative or purgative.

HYDRARGYRUM CUM CRETA. U. S. Mercury with Chalk.

	Metric.	Old form.
Mercury	38 Gm.	167 grains.
Clarified Honey	10 Gm.	48 grains.
Prepared Chalk	57 Gm.	248 grains.
Water, a sufficient quantity,		
To make	100 Gm.	1 oz. av.

Weigh the Mercury and Clarified Honey successively into a strong bottle of the capacity of 100 C.c. [old form 1 fl. oz.], and add 2 C.c. [old form 10 minims] of Water. Cork the bottle, and shake it for about half an hour at a time, until the aggregate time of shaking reaches ten hours, or until the globules of Mercury are no longer visible under a lens magnifying 4 diameters. The shaking may be more conveniently performed by mechanical means. Rub the Prepared Chalk with Water, in a mortar, to a thick, creamy paste, and, having added the contents of the bottle, washing the last portions in with a little Water, triturate the whole to a uniform mixture. Finally, dry the mixture, first between ample layers of bibulous paper, and afterwards in a capsule, at the ordinary temperature, until it weighs 100 Gm. [old form 1 oz. av.]. Then reduce it to a uniform powder, without trituration, and keep it in well-stoppered bottles, protected from light.

The intention here is to furnish mercury in a finely divided condition in the form of a powder. The above process is a very tedious one. In Matter's process, fifty-three grains of powdered acacia are mixed with fifty-three grains of chalk, enough water added to form a thin paste, and one hundred and sixty-seven grains of mercury added and triturated until extinguished. One hundred and sixty-five grains of chalk are made into a paste with water, and added to it, and the water evaporated from the mixture in a water-bath ; it is rubbed to powder when dry.

<i>Hydrargyrum cum Creta.</i> U. S.	ODOR AND TASTE.	SOLUBILITY.
A light gray powder, free from grittiness.	Odorless; slightly sweetish taste.	Water dissolves from it the sugar of milk. When it is subsequently treated with acetic acid, the chalk is dissolved with effervescence, leaving a residue of finely divided mercury.

TEST FOR IDENTITY.	IMPURITY.	TESTS FOR IMPURITY.
If a portion of the powder be digested with warm acetic acid, the filtrate should not become more than slightly opalescent on the addition of a few drops of hydrochloric acid (limit of mercurous oxide).	Mercuric Oxide.	{ If another portion of the powder be digested with warm, diluted hydrochloric acid, the filtrate should not be affected by hydrogen sulphide T.S., or by stannous chloride T.S.

Uses.—Mercury with chalk is a mild mercurial, frequently given to children. It should be free from mercurous or mercuric oxide; through exposure to air old specimens frequently contain both. The dose is five to ten grains (0.3 to 0.6 Gm.).

UNGUENTUM HYDRARGYRI. U.S. Mercurial Ointment.

[BLUE OINTMENT.]

This ointment is made by extinguishing 500 Gm. of mercury with 20 Gm. of oleate of mercury; the mixture is then incorporated with 250 Gm. of lard and 230 Gm. of suet, melted together. (See Unguenta.) The object of this process is to furnish finely divided mercury in a convenient form for external administration. The ointment is largely used, and the extemporaneous process furnishes a satisfactory preparation.

EMPLASTRUM HYDRARGYRI. U.S. Mercurial Plaster.

This plaster contains 300 Gm. of finely divided mercury extinguished by 12 Gm. of oleate of mercury and incorporated with 688 Gm. of melted lead plaster, the whole being thoroughly mixed whilst cooling. (See Emplastra.) Its uses are the same as those of the ointment, metallic mercury in a finely divided condition being present in both, the only difference being in the form of the preparations.

EMPLASTRUM AMMONIACI CUM HYDRARGYRO. U.S. Ammoniac Plaster with Mercury.

This plaster contains 18 per cent. of mercury with oleate of mercury, ammoniac, diluted acetic acid, and lead plaster. (See Emplastra.) Its uses are the same as those of mercurial plaster: it is a milder external application.

HYDRARGYRUM AMMONIATUM. U.S. Ammoniated Mercury.

[WHITE PRECIPITATE. MERCURIC AMMONIUM CHLORIDE.]

	Metric.	Old form.
Corrosive Mercuric Chloride, in powder	100 Gm.	1 oz. av.
Ammonia Water,		
Distilled Water, each, a sufficient quantity.		

Dissolve the Corrosive Mercuric Chloride in 2000 C.c. [old form 20 fl. oz.] of warm Distilled Water, filter the solution, and allow it to

cool. Pour the filtered liquid gradually, and with constant stirring, into 150 C.c. [old form 1½ fl. oz.] of Ammonia Water, taking care that the latter shall remain in slight excess. Collect the precipitate on a filter, and, when the liquid has drained from it as much as possible, wash it with a mixture of 400 C.c. [old form 4 fl. oz.] of Distilled Water and 20 C.c. [old form 1½ fl. dr.] of Ammonia Water. Finally, dry the precipitate between sheets of bibulous paper, in a dark place, at a temperature not exceeding 30° C. (86° F.).

Keep the product in well-stoppered bottles, protected from light.

In this process the ammonium of one-half of the ammonium chloride, which is formed upon mixing the solutions, has two of its hydrogen atoms replaced by one atom of bivalent mercury, NH₄Cl becoming NH₂HgCl.

Hydrargyrum Ammoniatum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
White, pulverulent pieces, or a white, amorphous powder, permanent in the air. At a temperature below a red heat the salt is decomposed without fusion, and at a red heat it is wholly volatilized. When heated with potassium or sodium hydrate T.S., the salt becomes yellow and evolves vapor of ammonia.	Odorless; earthy, afterwards styptic and metallic taste.	Water.	Alcohol.	Other Solvents.
		Cold, Insoluble.	Cold, Insoluble.	Readily soluble in warm hydrochloric, nitric, or acetic acid, and in a cold solution of ammonium carbonate. Also completely soluble in a cold solution of sodium hyposulphite, with the evolution of ammonia. When this solution is heated for a short time, red mercuric sulphide is separated, which, on protracted boiling, turns black.
		Boiling, Insoluble.	Boiling, Insoluble.	
		By prolonged washing with water it is gradually decomposed, assuming a yellow color, and becoming converted into a basic salt.		

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The solution of the salt in diluted nitric acid gives with potassium iodide T.S. a red precipitate, and with silver nitrate T.S. a white one.	Mercurous Salt.	{ The salt should be soluble in hydrochloric acid without residue. The salt should be soluble in hydrochloric acid without effervescence. Its solution in acetic acid should not be rendered turbid by diluted sulphuric acid.
	Carbonate.	
	Lead.	

Uses.—This compound of mercury is not used internally: it is applied externally in the form of ointment.

UNGUENTUM HYDRARGYRI AMMONIATI. U.S. Ointment of Ammoniated Mercury.

This ointment is made by incorporating 10 Gm. of ammoniated mercury with 90 Gm. of benzoinated lard. It is a valuable application in certain forms of eczema and psoriasis and other skin diseases.

HYDRARGYRI CHLORIDUM CORROSIVUM. U. S. Corrosive Mercuric Chloride.

HgCl₂; 270.54.

[CORROSIVE SUBLIMATE. CORROSIVE CHLORIDE OF MERCURY.]

Preparation.—This important mercuric salt may be made by the former official process, as follows :

Take of Mercury 24 oz. ; Sulphuric Acid 36 oz. ; Chloride of Sodium 18 oz. Boil the Mercury with the Sulphuric Acid, by means of a sand-bath, until a dry white mass is left. Rub this, when cold, with the Chloride of Sodium in an earthen-ware mortar ; then sublime with a gradually increasing heat.

By boiling sulphuric acid in excess with mercury to dryness a white salt (mercuric sulphate) is formed, according to the reaction

When this is mixed with sodium chloride, and the mixture exposed to a subliming heat, decomposition takes place, according to the reaction

The mercuric chloride thus formed sublimes, and the sodium sulphate remains behind.

Hydrargyri Chloridum Corrosivum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Heavy, colorless, rhombic crystals or crystalline masses, permanent in the air. When heated to about 265° C. (509° F.), the salt fuses to a colorless liquid, and at about 300° C. (572° F.) it volatilizes in dense, white vapors, leaving no residue.	Odorless; acid and persistent metallic taste; acid reaction; becomes neutral on the addition of sodium chloride.	At 15° C. (59° F.), 16 parts. Boiling, 2 parts.	Cold, 3 parts. Boiling, 1.2 parts.	Soluble in 4 parts of ether and about 14 parts of glycerin.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
With ammonia water it yields a white precipitate; with excess of hydrogen sulphide a black one; with potassium iodide T.S. a red one, soluble in an excess of the reagent; and with silver nitrate T.S. a white precipitate, insoluble in nitric acid.	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;"> <p>Arsenic.</p> <p>Many Foreign Salts.</p> </div> <div style="border-left: 1px solid black; padding-left: 10px;"> <p>If the precipitated mercuric sulphide obtained in the last test be washed with water, then shaken for a few minutes with ammonia water, and filtered, the filtrate should be colorless, and, on the addition of a slight excess of hydrochloric acid, should afford neither a yellow color nor a yellow precipitate.</p> <p>If a saturated, aqueous solution of the salt be heated nearly to boiling, then completely saturated with hydrogen sulphide, and allowed to stand for several hours in a well-corked flask, it should afford a colorless filtrate which, on evaporation, should leave no residue.</p> </div> </div>	

This chloride is always sublimed in masses, to distinguish it from mercurous chloride, or calomel, which is in powder.

Uses.—Pharmaceutically, mercuric chloride is used in several preparations to furnish the mercury in the compounds. Medicinally, as an alterative, it is one of the most valuable internal remedies in syphilis and chronic rheumatism. Externally, it is used as a stimulant and

escharotic. Recently it has been very extensively employed in anti-septic surgery. It is undoubtedly the most powerful antiseptic available, the only serious disadvantage being the necessity for great care on account of its poisonous properties. The antidote to poisoning by corrosive sublimate is the free use of white of egg, milk, or other albuminous liquids, followed by an emetic.

HYDRARGYRI CHLORIDUM MITE. U. S. Mild Mercurous Chloride.

[CALOMEL. MILD CHLORIDE OF MERCURY.]

Obtained in the form of powder by the rapid condensation of the vapor of Mercurous Chloride. Mild Mercurous Chloride should be kept in dark amber-colored bottles.

Preparation.—The former official process may be used to prepare mercurous chloride, as follows:

Take of Mercury 48 oz.; Sulphuric Acid 36 oz.; Chloride of Sodium 18 oz.; Distilled Water a sufficient quantity. Boil, by means of a sand-bath, 24 oz. of the Mercury with the Sulphuric Acid, until a dry white mass is left. Rub this, when cold, with the remainder of the Mercury, in an earthen-ware mortar, until they are thoroughly mixed. Then add the Chloride of Sodium, and, having rubbed it with the other ingredients until globules of Mercury cease to be visible, sublime the mixture into a large chamber so that the sublimate may fall in powder. Wash the sublimed matter with boiling Distilled Water, until the washings afford no precipitate with water of ammonia, and dry it.

In this preparation mercuric sulphate is first formed; this is then triturated with a quantity of mercury equal to that used in forming it; mercurous sulphate is produced, and when this is mixed with sodium chloride and sublimed, mercurous chloride is produced as a fine white sublimate, and sodium sulphate remains behind.

Hydrargyri Chloridum Mite. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A white, impalpable powder, becoming yellowish-white on being triturated with strong pressure, and showing only small, isolated crystals under a magnifying power of 100 diameters, permanent in the air. When strongly heated, it is wholly volatilized, without melting. The salt is blackened by ammonia water, calcium hydrate T.S., or solutions of alkali hydrates. A portion heated in a dry glass tube with dried sodium carbonate yields metallic mercury.	Odorless; tasteless.	Insoluble.	Insoluble.	Insoluble in ether, and cold dilute acids.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
On heating the salt in a test-tube with solution of potassium or sodium hydrate T.S., no odor of ammonia should be evolved; and acetic acid, agitated with the salt and filtered, should remain unaffected by hydrogen sulphide T.S., or silver nitrate T.S. (absence of and difference from ammoniated mercury).	Mercuric Chloride. Other Soluble Impurities.	If 10 C.c. of distilled water or of alcohol be agitated with 1 Gm. of the salt, the filtrates should not be affected by hydrogen sulphide T.S. or silver nitrate T.S. If 10 C.c. of distilled water or of alcohol be agitated with 1 Gm. of the salt, the filtrates should not leave any residue on evaporation.

Uses.—Calomel is largely used as a hepatic stimulant and alterative; it is also purgative, and, in large doses, sedative. It is given in doses of one-half grain to twenty grains (0.03 to 1.3 Gm.). Care must be exercised in prescribing calomel with other remedies that the chemical action does not produce corrosive sublimate. (See U. S. Dispensatory, 17th ed., page 695.)

HYDRARGYRI CYANIDUM. U. S. Mercuric Cyanide.

$\text{Hg}(\text{CN})_2$; 251.76.

Preparation.—This compound may be made by a former official process, as follows:

Take of Ferrocyanide of Potassium, 5 oz. troy; Sulphuric Acid, 4 oz. troy 120 gr.; Red Oxide of Mercury, in fine powder, Water, each, a sufficient quantity. Dissolve the Ferrocyanide of Potassium in 20 fl. oz. of Water, and add the solution to the Sulphuric Acid, previously diluted with 10 fl. oz. of Water, and contained in a glass retort. Distil the mixture nearly to dryness into a receiver, containing 10 fl. oz. of Water and 3 oz. troy of Red Oxide of Mercury. Set aside 2 fl. oz. of the distilled liquid, and to the remainder add, with agitation, sufficient Red Oxide to destroy the odor of hydrocyanic acid. Then filter the solution, and, having added the reserved liquid, evaporate the whole in a dark place, in order that crystals may form. Lastly, dry the crystals, and keep them in a well-stopped bottle, protected from the light.

The object of this process is to produce hydrocyanic acid by decomposing potassium ferrocyanide with sulphuric acid, and to conduct the vapor into a receiving vessel containing mercuric oxide and water. Mercuric cyanide is produced; this dissolves in the water, and the solution is evaporated and crystallized.

Hydrargyri Cyanidum. U. S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Colorless or white, prismatic crystals, becoming dark-colored on exposure to light. Exceedingly poisonous. If 1 part be gently heated with 1 part of iodine in a dry test-tube, it will afford at first a yellow sublimate, which afterwards becomes red, and above this a sublimate of colorless, needle-shaped crystals will be formed.	Odorless; bitter, metallic taste; neutral reaction.	At 15° C. (59° F.), 12.8 parts.	Cold, 15 parts.	Very sparingly soluble in ether.
		Boiling, 3 parts.	Boiling, 6 parts.	

TESTS FOR IDENTITY.	IMPURITY.	TESTS FOR IMPURITY.
When slowly heated, the salt decrepitates, and decomposes into metallic mercury and cyanogen gas, which is inflammable, burning with a purplish flame. On further heating, the blackish residue, containing paracyanogen and globules of metallic mercury, is wholly dissipated. On adding hydrochloric acid to the aqueous solution, hydrocyanic acid vapor is evolved.	Mercuric Chloride.	A 5-per-cent. aqueous solution of the salt should be neutral to litmus paper, and when mixed with a solution of potassium iodide T.S., should not yield a red or reddish precipitate soluble in excess of either liquid, nor should it yield a white precipitate with silver nitrate T.S.

Uses.—This cyanide is used as an alterative in syphilis, in doses of one-sixteenth to one-eighth of a grain (0.004 to 0.008 Gm.).

HYDRARGYRI IODIDUM FLAVUM. U. S. Yellow Mercurous Iodide.

$$\text{Hg}_2\text{I}_2 = 652.66.$$

[HYDRARGYRI IODIDUM VIRIDE, PHARM. 1880. PROTIOIDIDE OF MERCURY. YELLOW (OR GREEN) IODIDE OF MERCURY.]

	Metric.	Old form.
Mercury	50 Gm.	780 grains.
Nitric Acid,		
Potassium Iodide,		
Distilled Water,		
Alcohol, each, a sufficient quantity.		

Mix 20 C.c. [old form 5 fl. dr.], each, of Nitric Acid and Distilled Water, and, when the liquid is cold, pour it upon the mercury contained in a small glass flask. Set the mixture aside in a cool and dark place, and agitate it occasionally, until the reaction ceases, and a little mercury still remains undissolved. Separate the crystals of mercurous nitrate, which will have formed, from the mother-liquid, allow them to drain in a glass funnel, and dry them on bibulous paper, in a dark place. When the salt is dry, weigh off 40 Gm. [old form 584 grains] of it, and dissolve it in 1000 C.c. [old form 2 pints] of Distilled Water, to which 10 C.c. [old form 153 minims] of Nitric Acid had previously been added. Having prepared a solution of 24 Gm. [old form 350 grains] of Potassium Iodide in 1000 C.c. [old form 2 pints] of Distilled Water, slowly pour the solution of Potassium Iodide into that of the Mercurous Nitrate, with constant stirring, allow the precipitate to subside, decant the supernatant liquid, and transfer the precipitate, together with the remainder of the liquid, to a filter. When the precipitate has drained, wash it with Distilled Water until the washings no longer have an acid reaction upon litmus paper, and afterwards wash it with Alcohol, as long as the clear, colorless washings give any color with hydrogen sulphide test-solution. Lastly, dry the product in a dark place, between sheets of bibulous paper, at a temperature not exceeding 40° C. (104° F.). Keep it in dark amber-colored vials, with the least possible exposure to light.

Instead of weighing off 40 Gm. [old form 584 grains] of the Mercurous Nitrate as above directed, the whole of the crystallized salt may

be taken and the amount of Potassium Iodide, etc., adjusted on the proportions given above.

Hydrargyri Iodidum Flavum. U.S.	IMPURITY.	TEST FOR IMPURITY.
<p>A bright yellow amorphous powder, becoming darker by exposure to light, odorless and tasteless, almost insoluble in water, and wholly insoluble in alcohol or ether. When slowly and moderately heated, it assumes at first an orange and then a red color, becoming yellow again on cooling. When quickly and strongly heated, it is at first partially decomposed into mercury and mercuric iodide, and finally is completely volatilized.</p> <p>When it is heated with sulphuric acid and a little manganese dioxide, vapor of iodine is evolved.</p> <p>In contact with a solution of potassium iodide, the salt is decomposed into mercuric iodide, which dissolves, leaving a residue of metallic mercury.</p>	<p>More than traces of Mercuric Iodide.</p>	<p>If 0.5 Gm. of the salt be shaken with 10 C.c. of alcohol, a portion of the filtrate should be scarcely affected by hydrogen sulphide T.S., nor should it produce more than a very faint, transient opalescence when dropped into water; and if 5 C.c. of the filtrate be evaporated from a white porcelain surface, not more than a very faint red stain should remain.</p>

Uses.—Yellow mercurous iodide is used as an alternative. It is better adapted for internal administration than the red iodide, because it is milder. The dose is one grain (0.06 Gm.).

HYDRARGYRI IODIDUM RUBRUM. U.S. Red Mercuric Iodide.

$$\text{HgI}_2 = 452.86.$$

[BINIODIDE OF MERCURY. RED IODIDE OF MERCURY.]

	Metric.	Old form.
Corrosive Mercuric Chloride.	40 Gm.	584 grains.
Potassium Iodide.	50 Gm.	780 grains.
Distilled Water, a sufficient quantity.		

Dissolve the Corrosive Mercuric Chloride and the Potassium Iodide, each, in 800 C.c. [old form 25½ fl. oz.] of Distilled Water, and filter the solutions separately. Pour both solutions, simultaneously and in a thin stream, under constant and very active stirring, into 2000 C.c. [old form 4 pints] of Distilled Water. When the precipitate has subsided, decant the supernatant liquid, collect the precipitate on a filter, and wash it with cold Distilled Water, until the washings give not more than a slight opalescence with silver nitrate test-solution. Finally, dry it in a dark place, between sheets of bibulous paper, at a temperature not exceeding 40° C. (104° F.).

Keep the product in well-stoppered bottles, protected from light.

In this process mercuric iodide and potassium chloride are formed by double decomposition.

As mercuric iodide is soluble in solutions both of mercuric chloride and of potassium iodide, it is not profitable to use an excess of either.

It may be obtained in handsome crystals by dissolving it in hot hydrochloric acid to saturation and allowing the solution to cool slowly.

Hydrargyri Iodidum Rubrum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A scarlet-red, amorphous powder, permanent in the air. When heated to about 150° C. (302° F.), the salt turns yellow, but reassumes its red color on cooling. At 238° C. (400.4° F.) it fuses to a dark yellow liquid, which on cooling forms a yellow, crystalline mass, and, at higher temperatures, volatilizes without decomposition, leaving no residue.	Odorless; tasteless.	Almost insoluble.	At 15° C. (59° F.), 130 parts. Boiling, 15 parts.	Soluble in solution of potassium iodide or of mercuric chloride, and in a solution of sodium hyposulphite.
TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.		
On heating the salt with potassium or sodium hydrate T.S., and adding a little sugar of milk, metallic mercury is precipitated. If the salt be heated with sulphuric acid and some manganese dioxide, vapor of iodine will be given off.	Soluble Iodides or Chlorides. Mercuric Chloride.	{ If 10 C.c. of water is agitated with 0.5 Gm. of the salt, the filtered liquid should not become more than very slightly colored by hydrogen sulphide T.S., nor give more than a slight opalescence with silver nitrate T.S. { If the salt be dissolved in hot alcohol, the solution, after cooling, should be colorless, and when this solution is diluted with an equal volume of water it should not redden blue litmus paper.		

Uses.—This iodide is used internally in the treatment of syphilis, in doses of one-sixteenth of a grain (0.004 Gm.); it is frequently given in pill form combined with potassium iodide. Externally, it is often used in the form of an ointment, of the strength of sixteen grains to the ounce, which was formerly official.

HYDRARGYRI OXIDUM FLAVUM. U. S. Yellow Mercuric Oxide.

HgO; 215.76.

	Metric.	Old form.
Corrosive Mercuric Chloride	100 Gm.	1460 grains.
Soda	40 Gm.	584 grains.
Distilled Water, a sufficient quantity.		

Dissolve the Corrosive Mercuric Chloride in 1000 C.c. [old form 2 pints] of warm Distilled Water, and filter the solution. Dissolve the Soda (which should contain 90 per cent. of sodium hydrate) in 1000 C.c. [old form 2 pints] of cold Distilled Water, and into this solution pour gradually, and with constant stirring, the solution of Corrosive Mercuric Chloride. Allow the mixture to stand for an hour at a temperature of about 30° C. (86° F.), stirring frequently. Then decant the supernatant, clear liquid from the precipitate, and wash the latter repeatedly by the affusion and decantation of Distilled Water, using 1000

C.c. [old form 2 pints] of Water each time. Collect the precipitate on a strainer, and continue the washing with warm Distilled Water, until a small portion of the washings, when poured on a little mercuric chloride test-solution, no longer produces a yellowish turbidity at the line of contact of the two liquids. Then allow the precipitate to drain, and dry it between sheets of bibulous paper, in a dark place, at a temperature not exceeding 30° C. (86° F.).

Keep the product in well-stoppered bottles, protected from light.

Hydrargyri Oxidum Flavum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A light orange-yellow, heavy, amorphous, impalpable powder, permanent in the air, and turning darker on exposure to light. When moderately heated, it assumes a red color; at a red heat it is completely decomposed, giving off oxygen and separating metallic mercury, and is finally volatilized without residue.	Odorless; somewhat metallic taste.	Almost insoluble.	Insoluble.	Readily and completely soluble in diluted hydrochloric acid or nitric acid, forming colorless solutions.

TESTS FOR IDENTITY.

If 0.5 Gm. of the Oxide be digested on a water-bath for fifteen minutes, with a solution of 1 Gm. of oxalic acid in 10 C.c. of water, it will be converted into white mercuric oxalate (distinction from *red mercuric oxide*).

On dissolving 1 Gm. of the Oxide in 100 C.c. of diluted nitric acid, the resulting solution should be clear, and should not afford more than a slight opalescence with silver nitrate T.S. (limit of *chloride*).

Uses.—Yellow mercuric oxide is used in making the oleate of mercury and in the official ointment: it is employed only externally.

UNGUENTUM HYDRARGYRI OXIDI FLAVI. U. S. Ointment of Yellow Mercuric Oxide.

This preparation is made by incorporating 10 Gm. of yellow mercuric oxide with 90 Gm. of ointment. Its uses are the same as those of the older ointment of red mercuric oxide. (See Unguenta.)

OLEATUM HYDRARGYRI. U. S. Oleate of Mercury.

This oleate is made by dissolving 20 Gm. of dried yellow mercuric oxide in 80 Gm. of oleic acid. It is best to avoid heat in making this preparation, to prevent partial decomposition and separation of metallic mercury; in time this change slowly takes place, even when the directions have been strictly followed (see page 342).

HYDRARGYRI OXIDUM RUBRUM. U. S. Red Mercuric Oxide.

HgO; 215.76.

[RED PRECIPITATE.]

Preparation.—This oxide may be made by a former official process, as follows:

Take of Mercury 36 oz.; Nitric Acid 24 oz.; Water 2 pints. Dissolve the Mercury, with the aid of a gentle heat, in the Acid and Water previously mixed, and evaporate to dryness. Rub the dry mass into powder, and heat it in a very shallow vessel until red vapors cease to rise.

Mercuric nitrate is first formed, and this is decomposed by heat.

It is more economical to add an equal weight of mercury to the mercuric nitrate, before heating, as it also may be converted into oxide through the escaping nitrogen dioxide and heat.

Hydrargyri Oxidum Rubrum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
Heavy, orange-red, crystalline scales, or a crystalline powder, becoming more yellow the finer it is divided, permanent in the air. When heated to about 400° C. (752° F.) it becomes dark violet or almost black, but assumes its original color on cooling. At a red heat it is completely decomposed, giving off oxygen and separating metallic mercury, and is finally volatilized without residue.	Odorless; somewhat metallic taste.	Almost insoluble.	Insoluble.	Wholly soluble in diluted nitric or hydrochloric acid, forming colorless solutions.
Tests.	IMPURITY.	TEST FOR IMPURITY.		
When 0.5 Gm. is digested, on a water-bath, with a solution of 1 Gm. of oxalic acid in 10 C.c. of water, it does not change color within two hours (distinction from <i>yellow mercuric oxide</i>). On dissolving 1 Gm. of the Oxide in 100 C.c. of diluted nitric acid, the resulting solution should be clear, and should not afford more than a slight opalescence with silver nitrate T.S. (limit of <i>chloride</i>).	Nitrate.	{ When strongly heated in a test-tube, the vapors should not redden moistened blue litmus paper.		

Uses.—Red mercuric oxide has the same chemical composition as the yellow oxide. It is used in the form of ointment for inflamed eyelids, in skin diseases, and for destroying body-vermin.

UNGUENTUM HYDRARGYRI OXIDI RUBRI. U. S. Ointment of Red Mercuric Oxide.

This preparation, usually known as red precipitate ointment, is made by incorporating 10 Gm. of red mercuric oxide with 5 Gm. of castor oil and 85 Gm. of ointment. It is used as a stimulating application to indolent sores and in blepharitis.

**HYDRARGYRI SUBSULPHAS FLAVUS. U. S. Yellow Mercuric
Subsulphate.**

$\text{Hg}(\text{HgO})_2\text{SO}_4$; 727.14.

[BASIC MERCURIC SULPHATE. TURPETH MINERAL.]

	Metric.	Old form.
Mercury	100 Gm.	1640 grains.
Sulphuric Acid	30 C.c.	460 minims.
Nitric Acid	25 C.c.	384 minims.
Distilled Water, a sufficient quantity.		

Upon the Mercury, contained in a capacious flask, pour the Sulphuric Acid, previously mixed with 15 C.c. [old form 230 minims] of Distilled Water, then add, very gradually, the Nitric Acid, previously mixed with 25 C.c. [old form 384 minims] of Distilled Water, and digest at a gentle heat until reddish fumes are no longer given off. Transfer the mixture to a porcelain capsule, and heat it on a sand-bath, under a hood, or in the open air, with frequent stirring, until a dry, white mass remains. Reduce this to a fine powder, and add it in small portions at a time, with constant stirring, to 2000 C.c. [old form 4 pints] of boiling Distilled Water. When all has been added, continue the boiling for ten minutes; then allow the mixture to settle, decant the supernatant liquid, transfer the precipitate to a strainer, wash it with warm Distilled Water, until the washings no longer have an acid reaction, and dry it in a moderately warm place.

Keep the product in well-stoppered bottles, protected from light.

When normal mercuric sulphate (HgSO_4) is mixed with boiling water it is decomposed, and basic mercuric sulphate, $\text{Hg}(\text{HgO})_2\text{SO}_4$, separates, as a yellow precipitate, whilst acid mercuric sulphate remains in solution.

Hydrargyri Subsulpas Flavus. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, lemon-yellow powder, permanent in the air. When heated, the salt turns red, becoming yellow again on cooling. At a red heat it is volatilized, evolving vapors of mercury and of sulphur dioxide, leaving no residue.	Odorless; almost tasteless.	At 15° C. (59° F.), 2000 parts.	Insoluble.	Soluble in nitric or hydrochloric acid.
		Boiling, 600 parts.		

TESTS FOR IDENTITY.

To prove the absence of mercurous salt or of lead, this compound should be soluble in 10 parts of hydrochloric acid without residue.

A solution of the salt in nitric or hydrochloric acid, diluted with water, gives with potassium iodide T.S. a red precipitate, and with barium chloride T.S. a white one.

Uses.—This mercurial salt is rarely used. It is powerfully irritant, and may be replaced by milder mercurials with advantage. The dose, as an alterative, is from one-quarter to one-half grain (0.016 to 0.032 Gm.).

LIQUOR HYDRARGYRI NITRATIS. U. S. Solution of Mercuric Nitrate.

A liquid containing about 60 per cent. of Mercuric Nitrate [$\text{Hg}(\text{NO}_3)_2 = 328.58$], together with about 11 per cent. of free Nitric Acid.

	Metric.	Old form.
Red Mercuric Oxide	40 Gm.	4 oz. av.
Nitric Acid	45 Gm.	8 fl. oz.
Distilled Water	15 Gm.	1 fl. oz. $8\frac{1}{2}$ fl. dr.
To make	100 Gm.	about $4\frac{1}{2}$ fl. oz.

Mix the Nitric Acid with the Distilled Water, and dissolve the Red Mercuric Oxide in the mixture.

Keep the product in glass-stoppered bottles.

Liquor Hydrargyri Nitratis. U. S.		ODOR AND REACTION.
A clear, nearly colorless, heavy liquid. Sp. gr. about 2.100 at 15° C. (59° F.). A few drops evaporated on a porcelain capsule leave a white residue, which, on heating, becomes yellow, red, and brown, and is finally entirely volatilised. On a bright surface of copper, the Solution deposits a coating of mercury.		Faint odor of nitric acid; strongly acid reaction.
TESTS FOR IDENTITY.	IMPURITY.	TESTS FOR IMPURITY.
The diluted Solution affords, with potassium or sodium hydrate T.S., a yellow precipitate, and with potassium iodide T.S., a bright red one, soluble in excess of the reagent. A clear crystal of ferrous sulphate, dropped into the Solution, rapidly acquires a brown color and becomes surrounded by a brownish-black zone.	Mercurous Salt.	No precipitation or cloudiness should occur in the Solution on the addition of distilled water or of diluted hydrochloric acid.

Uses.—This is a corrosive liquid, used principally to cauterize malignant ulcerations, cancers, etc. It is never given internally.

UNGUENTUM HYDRARGYRI NITRATIS. U. S. Ointment of Mercuric Nitrate.**[CITRINE OINTMENT.]**

This important ointment is made by heating 760 Gm. of lard oil to a temperature of 100° C. (212° F.), and then adding, *without stirring*, 70 Gm. of nitric acid, continuing the heat as long as moderate effervescence continues, and then allowing the mixture to cool; 70 Gm. of mercury are dissolved in 105 Gm. of nitric acid with the aid of sufficient heat, and this solution is added to the ointment before it has become entirely cold. When nitric acid is added to lard oil under the above circumstances, the *olein* of the oil is converted into *elaïdin*, and the color changes to a deep orange: this, upon stirring and cooling, becomes lighter, and it has received the name of citrine ointment. It is used in various skin diseases and in inflammation of the eyelids. (See Unguenta.)

QUESTIONS ON CHAPTERS XLV. AND XLVI.

NICKEL, COBALT, TIN, LEAD, COPPER, SILVER,
MERCURY.

- Nickel—What is the Latin name? Give symbol and atomic weight.
 Give description and specific gravity. Where is it obtained?
 What alloy does it form with copper?
 For what purpose are the salts of nickel used?
 What are the tests for compounds of nickel?
 Cobalt—Give symbol and atomic weight. Give description and specific gravity.
 How is it found? What classes of salts does it form?
 What is flystone, and how is it used?
 What is barometer paper, and what is the explanation of its use?
 Are any of the salts of cobalt officinal?
 What are the tests for salts of cobalt?
 Tin—Give symbol and atomic weight.
 Give description and specific gravity.
 What classes of salts does it form?
 What are the tests for compounds of tin?
 Lead—Give Latin name, symbol, and atomic weight.
 Give description and specific gravity.
 How is it obtained?
 What compounds does it form with oxygen?
 What are the tests for compounds of lead?
 Is water rendered poisonous by passing through lead pipes?
 Lead acetate—Give Latin name, formula in symbols, and molecular weight.
 What is its synonyme?
 How is it made? Describe rationale of process.
 Is the commercial salt fit for pharmaceutical use? Why?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Zinc; alkalies, or alkaline earths; copper.
 What is the dose?
 Why is solution of lead acetate in water turbid?
 Solution of lead subacetate—How much lead subacetate does this solution contain?
 How is it prepared, and what is the object of the process? Describe rationale of process.
 What is its specific gravity? Describe odor, taste, and chemical reaction.
 How may its strength be tested?
 What is its popular name?
 What are its properties and uses in medicine?
 Diluted solution of lead subacetate—Why is this solution usually opalescent?
 Is this an advantage or a disadvantage? Why?
 For what is it used?
 Cerate of lead subacetate—How is it prepared, and what are its properties?
 What is its popular name?
 How may it be prevented from turning yellow?
 Lead carbonate—Give the formula in symbols and molecular weight.
 How may this salt be prepared by the pharmacist?
 How is the commercial article prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Zinc; alkalies, or alkaline earths.
 What are its uses?
 Ointment of lead carbonate—How is it made? What is its use?
 Lead iodide—What is the British process for making this salt?
 Why is lead nitrate preferred to the acetate?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Zinc; alkalies, or alkaline earths.
 Ointment of lead iodide—How is it made? What is its use?

- Lead nitrate—Give Latin official name, formula in symbols, and molecular weight.
 How may this salt be prepared?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Zinc; alkalies, or alkaline earths; copper.
 How is it used?
 Lead oxide—Give Latin official name, formula in symbols, and molecular weight.
 How is the commercial salt usually obtained?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Carbonate; zinc; alkalies, or alkaline earths.
 What is red lead, and how is it made?
 Lead plaster—What is it, and how is it made?
 For what is it used?
 Diachylon ointment—What is it, and for what is it used?
 Copper—Give Latin name.
 What is its symbol? What is its atomic weight? Give description and specific gravity.
 How is it found?
 What oxides does it form? Give their formulas.
 What are the tests for compounds of copper?
 Copper sulphate—Give formula in symbols and molecular weight.
 How is it made?
 How much water of crystallization does it contain?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the following impurities be detected?—viz.: Foreign metals; alkalies, or alkaline earths.
 What is the dose?
 Silver—Give Latin name, symbol, and atomic weight. Give description and specific gravity.
 How is it found?
 What combination does it make with oxygen?
 What are the tests for silver salts?
 Silver cyanide—Give formula in symbols and molecular weight.
 How is it prepared? Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 For what is it used?
 Silver iodide—Give formula in symbols and molecular weight.
 How may it be made?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may impurity of chloride be detected?
 What is the dose?
 Silver nitrate—Give formula in symbols and molecular weight.
 Give the process (formerly official) by which this may be made.
 How is the copper separated from the silver, with which it is usually mixed, in making this solution?
 Describe rationale of process.
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may the foreign metallic impurities be detected?
 What is the dose?
 Diluted silver nitrate—How is it made?
 What is the object of this preparation?
 Describe odor, taste, and chemical reaction.
 For what is it used?
 Moulded silver nitrate—How is it made?
 What is the object of adding hydrochloric acid?
 How may it be prevented from becoming discolored during the process of casting?
 Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
 How may its quality be tested?
 For what is it used?
 How may a convenient caustic-holder be made?
 Silver oxide—Give Latin name, formula in symbols, and molecular weight.
 Describe the process (formerly official) by which it may be made.
 Describe rationale of process. Describe odor, taste, chemical reaction, and solubility.
 How may impurity of carbonate be detected?

What is its use? Why should it not be triturated with oxidizable or combustible substances?

What action does ammonia have upon it?

Mercury—Give Latin name, symbol, and atomic weight.

Describe it and give specific gravity.

How is it found, and where does it come from?

At what temperature does it solidify?

What two series of compounds does it form?

Is it used in medicine in the metallic state?

What are the tests for compounds of mercury?

How may mercury be purified?

Describe odor, taste, and chemical reaction.

How may the following impurities be detected?—viz.: Tin and other metals; moisture; organic impurities; more than slight traces of foreign metals.

For what is it used medicinally?

Mass of mercury—Give the Latin name.

How is it made?

What is the object of this preparation? What is the dose?

Mercury with chalk—How is it made?

What is the object of this preparation?

What is Matter's process for making it?

What is the dose?

Mercurial ointment—How is it made?

What is the object of this preparation?

Mercurial plaster—How is it made?

What percentage of mercury does it contain?

Ammoniac plaster with mercury—How much mercury does it contain?

For what purpose is it used?

Ammoniated mercury—Give formula in symbols and molecular weight.

How is it made? Give rationale of process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Mercurous salt; carbonate; lead.

How is it used?

Ointment of ammoniated mercury—How is it made?

For what is it used?

Corrosive mercuric chloride—Give Latin name, symbolic formula, and molecular weight.

Describe the process (formerly official) by which it may be made.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurity of arsenic be detected?

In case of poisoning, what are the proper antidotes?

Mild mercurous chloride—Give Latin name, symbolic formula, and molecular weight.

Describe the process (formerly official) by which it may be made.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Mercuric chloride; fixed soluble impurities.

What is the dose? What caution is necessary in prescribing calomel?

Mercuric cyanide—Give Latin name, symbolic formula, and molecular weight.

Describe the process (formerly official) by which it may be made.

What is the object of this process? Give rationale of process.

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may impurity of mercuric chloride be detected?

What is the dose?

Red mercuric iodide—Give Latin name, formula in symbols, and molecular weight.

How is it made?

Describe odor, taste, chemical reaction, and solubility. Give tests for identity.

How may the following impurities be detected?—viz.: Soluble iodide; chloride.

What is the dose?

Yellow mercurous iodide—Give Latin name, symbolic formula, and molecular weight.

How is it made?

What is the object of washing this salt with alcohol?

Describe odor, taste, and chemical reaction. What is the dose?

Yellow mercuric oxide—How is it prepared? Describe rationale of process.
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
For what is it used?
Ointment of yellow mercuric oxide—How is it made, and for what is it used?
Oleate of mercury—What is the Latin name?
How is it made?
Red mercuric oxide—What is the Latin name?
Give the formula in symbols and molecular weight.
Describe the process (formerly official) by which this may be made.
Give rationale of process.
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may impurity of nitrate be detected?
Wherein does it differ from yellow mercuric oxide?
For what is it used?
Ointment of red mercuric oxide—What is the Latin name?
How is it made, and for what is it used?
Yellow mercuric subsulphate—Give the formula in symbols and molecular weight.
How is it made? Give rationale of process.
Describe odor, taste, chemical reaction, and solubility.
How may the presence of mercurous salt be tested?
What is the dose?
Solution of mercuric nitrate—What is the Latin name?
Give description and specific gravity.
How much mercuric nitrate does this solution contain?
How is it made?
Describe odor, taste, chemical reaction, and solubility. Give tests for identity.
How may the presence of mercurous salt be indicated?
What is its use?
Ointment of mercuric nitrate—How is it made? Give rationale of process.
For what is it used?

CHAPTER XLVII.

ANTIMONY, ARSENIC, AND BISMUTH.

Sb; 119.6. As; 74.9. Bi; 208.9.

THESE three metals, which have the Latin names Antimonium, Arsenium, Bismuthum, form a group which presents several analogies. Arsenic is regarded by a number of chemists as not metallic, and on account of some of its chemical relations it is classed by them with the non-metallic elements, but in some of its physical properties, notably its lustre, specific gravity, etc., it closely resembles the metals, and it is therefore considered in the group with antimony and bismuth.

Antimony (Stibium). Sb; 119.6.

This metal is found in nature in a free state, and as a sulphide, oxide, or oxysulphide. The native sulphide is the chief source of the metal, and roasting with iron and sodium sulphide is the process generally resorted to for obtaining it. It is a brittle, brilliant metal, of a lamellated texture, of a silver-white color when pure, but bluish-white as it occurs in commerce. When rubbed between the fingers, it imparts a sensible odor. Its sp. gr. is 6.7, and its fusing point 425°C . (797°F .), or about a red heat. It forms three combinations with oxygen,—*antimony trioxide* (antimonous oxide), Sb_2O_3 , *antimony tetroxide*, Sb_2O_4 (by some considered to be an antimonate of the tetroxide of antimony, Sb_4O_8), and *antimony pentoxide* (antimonic oxide), Sb_2O_5 . The first of these unites with water to form antimonous acid, the salts of which are called *antimonites*; the third unites with water to form antimonic acid, the salts of which are called *antimonates*.

Tests for Salts of Antimony.

1. If hydrogen sulphide be added to an acidified solution of salt of antimony, an orange-red precipitate of sulphide will be produced. This is soluble in ammonium sulphide, but is again precipitated upon the addition of an acid.
2. If hydrochloric acid be added to the sulphide, so as to form a strong solution of antimonous chloride, and this be mixed with water, a white precipitate of oxychloride will be produced.
3. Zinc and iron precipitate antimony as a black powder from its solutions, copper precipitates it as a metallic film; this may be dissolved

by potassium permanganate, and this solution will yield antimony sulphide with hydrogen sulphide.

Official Preparations of Antimony.

Official Name.	Preparation.
Antimonii et Potassii Tartras . . .	By boiling antimonous oxide and acid potassium tartrate together with water, evaporating, and crystallizing.
Antimonii Oxidum	By adding antimonous chloride to water, and treating the oxychloride formed with ammonia water.
Antimonii Sulphidum	By purifying antimony ore by fusion.
Antimonii Sulphidum Purificatum .	By macerating antimonous sulphide with water containing a trace of ammonia water.
Antimonium Sulphuratum	By boiling antimonous sulphide with solution of soda and adding sulphuric acid to the hot solution.
Pilulæ Antimonii Compositæ . . .	Each pill contains about $\frac{1}{2}$ gr. sulphurated antimony, $\frac{1}{2}$ gr. mild mercurous chloride, and 1 gr. gualac, made into a mass with castor oil.
Pulvis Antimonialis	88 Gm. antimony oxide, 67 Gm. precipitated calcium phosphate.
Vinum Antimonii	4 Gm. antimony and potassium tartrate, 65 Gm. distilled water, 150 C.c. alcohol, and sufficient white wine to make 1000 C.c.

Unofficial Salts of Antimony.

Antimonii Bromidum, SbBr ₃ . Antimony Bromide.	By adding dry antimony to bromine contained in a retort, agitating until the combination is complete, then purifying by distillation, and collecting the crystals.
Antimonii Fluoridum, SbF ₃ . Antimony Fluoride.	By placing antimony and mercury fluoride in a retort, distilling, and collecting the white mass.
Antimonii Iodidum, SbI ₃ . Antimony Iodide.	By direct combination of the elements.
Antimonii Oxysulphidum, Sb ₂ S ₃ and Sb ₂ O ₃ . Antimony Oxysulphide.	By boiling 1 p. black antimony with 250 p. water containing 23 p. sodium carbonate, filtering, and collecting the precipitate.
Antimonii Pentasulphidum. Antimony Pentasulphide.	By adding 70 p. crystallized sodium carbonate to 250 p. water and boiling; then mixing with 26 p. lime and 80 p. water; lastly, adding 36 p. levigated antimony sulphide and 7 p. sublimed sulphur, boiling until the gray color disappears, filtering, and then crystallizing.
Antimonii Sulphas, Sb ₂ (SO ₄) ₃ . Antimony Sulphate.	By boiling antimony with strong sulphuric acid, and collecting the white mass.

ANTIMONII ET POTASSII TARTRAS. U. S. Antimony and Potassium Tartrate.

[TARTAR EMETIC. TARTARATED ANTIMONY.]

Antimony and Potassium Tartrate should be kept in well-stoppered bottles.

This, the most important antimonial compound, may be made by a former official process, as follows:

Take of Oxide of Antimony, in very fine powder, 2 oz.; Bitartrate of Potassium, in very fine powder, $2\frac{1}{2}$ oz.; Distilled Water, 18 fl. oz. To the Water, heated to the boiling point in a glass vessel, add the

powders, previously mixed, and boil for an hour; then filter the liquid while hot, and set it aside that crystals may form. Lastly, dry the crystals, and keep them in a well-stopped bottle. By further evaporation the mother-water may be made to yield more crystals, which should be purified by a second crystallization.

Like potassium and sodium tartrate, this is a double salt. Two replaceable hydrogen atoms of tartaric acid ($\text{H}_2\text{C}_4\text{H}_4\text{O}_6$) are substituted by one of antimonyl (SbO) and one of potassium (K). The group (SbO) is hypothetical.

Antimonii et Potassii Tartaras. U.S.	ODOR, TASTE, AND REACTION.	SOLUBILITY.	
		Water.	Alcohol.
Colorless, transparent crystals of the rhombic system, becoming opaque and white on exposure to air, or a white granular powder. When heated to 110°C . (230°F .), the salt loses its water of crystallization. When heated to redness, the salt chars, emits the odor of burnt sugar, and leaves a blackened residue of an alkaline reaction.	Odorless; sweet, afterwards disagreeable, metallic taste; feebly acid reaction.	At 15°C . (59°F .), 17 parts. Boiling, 3 parts.	Insoluble. It precipitates it from its aqueous solution in the form of a crystalline powder.

TESTS.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The aqueous solution of the salt yields, with hydrochloric acid, a white precipitate soluble in an excess of the acid; but no precipitate occurs if tartaric acid has been previously added. In a solution of the salt acidulated with hydrochloric acid, hydrogen sulphide T.S. produces an orange-red precipitate. A dilute solution at once becomes permanently turbid on the addition of a little potassium carbonate or calcium hydrate T.S.</p> <p>If 0.331 Gm. of the crystallized salt, or 0.322 Gm. of the salt dried at 110°C. (230°F.), be dissolved in 10 C.c. of water, and about 20 C.c. of a cold, saturated solution of sodium bicarbonate, and a little starch T.S. added, it should require not less than 20 C.c. of decinormal iodine V.S. to produce a permanent blue color. (Corresponds to 100 per cent. of pure salt.)</p>	Sulphate.	<p>A 1-per-cent. aqueous solution of the salt, previously acidulated with acetic acid, should not be clouded by the addition of a few drops of barium chloride T.S.</p> <p>A 1-per-cent. aqueous solution of the salt, previously acidulated with acetic acid, should not be clouded by the addition of a few drops of potassium ferrocyanide T.S.</p> <p>A 1-per-cent. aqueous solution of the salt, previously acidulated with acetic acid, should not be clouded by the addition of a few drops of ammonium oxalate T.S.</p> <p>A 1-per-cent. aqueous solution of the salt, previously acidulated with acetic acid, should not be clouded by the addition of a few drops of silver nitrate T.S.</p> <p>If 1 Gm. of the salt be dissolved, with the aid of heat, in hydrochloric acid, and to this solution 1 C.c. of stannous chloride T.S. be added (see List of Reagents, Bettendorff's Test for Arsenic), no turbidity or coloration should ensue within one hour.</p> <p>On adding sodium carbonate T.S. to crushed crystals of the salt, effervescence should not ensue.</p>
	Iron and other Metals.	
	Calcium.	
	Chloride.	
	More than traces of Arsenic.	
	Potassium Bitartrate.	

Uses.—Tartar emetic, as its name implies, is used as an emetic, in doses of half a grain to one grain (0.03 to 0.06 Gm.), repeated until vomiting takes place. It is given in minute doses as an alterative or diaphoretic. In cases of poisoning by an overdose, tannin should be administered in some form, freely: the insoluble tannate is formed.

ANTIMONII OXIDUM. U. S. Antimony Oxide.

$\text{Sb}_2\text{O}_3 = 287.08.$

[ANTIMONY TRIOXIDE.]

Preparation.—The former official process may be used in making this oxide. It is as follows:

Take of Sulphide of Antimony, in very fine powder, 4 oz. troy; Hydrochloric Acid, 18 oz. troy; Nitric Acid, 1 oz. troy, 120 grains; Water of Ammonia, $1\frac{1}{2}$ fl. oz.; Water, Distilled Water, each, a sufficient quantity. Introduce the Sulphide into a flask, of the capacity of two pints, and, having added the Hydrochloric Acid, digest, by means of a sand-bath, until effervescence ceases. Then, having removed the flask from the sand-bath, add the Nitric Acid gradually; and, when nitrous acid vapors cease to be given off, and the liquid has grown cold, add to it half a pint of Water, and filter. Pour the filtered liquid gradually into twelve pints of Water, constantly stirring, and allow the precipitate to subside. Decant the supernatant liquid, and wash the precipitate twice by decantation, using, each time, eight pints of Water. Then transfer it to a muslin filter to drain, and, after the draining is completed, wash it with Water until the washings cease to have an acid reaction. Next introduce it into a suitable vessel, and subject it to the action of the Water of Ammonia for two hours; at the end of which time transfer it to a moistened muslin filter, and wash it with Distilled Water as long as the washings produce a precipitate with nitrate of silver. Lastly, dry the precipitate upon bibulous paper with the aid of a gentle heat.

The first step in this process is the formation of antimonous chloride, SbCl_3 . When this is added to water it is decomposed, an oxychloride being formed, $2\text{SbCl}_3 \cdot 5\text{Sb}_2\text{O}_3$. This is converted into oxide by treating it with ammonia.

then

and

Antimonii Oxidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, grayish-white powder, permanent in the air.	Odorless; tasteless.	Almost insoluble.	Insoluble.	Hydrochloric acid dissolves it without effervescence; soluble in warm solution of tartaric acid, and in boiling solution of potassium bitartrate; insoluble in nitric acid.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
When heated, the Oxide turns yellow, becoming white again on cooling, and at a dull red heat fuses to a yellowish liquid, which concretes, on cooling, to a crystalline mass of a pearly color. At a higher temperature it sublimates, producing colorless and transparent, or white, shining, needle-shaped crystals. On dropping its solution in hydrochloric acid into water, a white precipitate is formed, which is immediately changed to orange by hydrogen sulphide T.S.	Chloride.	If 1 Gm. of the Oxide be dissolved with the aid of 5 Gm. of tartaric acid in a little water, and the solution diluted with water to the measure of 100 C.c., portions of this solution should not be affected by test-solutions of silver nitrate.
	Sulphate.	If 1 Gm. of the Oxide be dissolved with the aid of 5 Gm. of tartaric acid in a little water, and the solution diluted with water to the measure of 100 C.c., portions of this solution should not be affected by barium chloride T.S.
	Iron and other Metals.	If 1 Gm. of the Oxide be dissolved with the aid of 5 Gm. of tartaric acid in a little water, and the solution diluted with water to the measure of 100 C.c., portions of this solution should not be affected by potassium ferrocyanide T.S.
	Copper and Lead.	If a solution of the Oxide in hydrochloric acid be diluted with water, until it just begins to become permanently turbid, and then precipitated with hydrogen sulphide, this precipitate, when collected and thoroughly washed, should be completely soluble in ammonium sulphide T.S.
	Arsenic.	If 1 Gm. of the Oxide be dissolved in hydrochloric acid, and to this solution 1 C.c. of stannous chloride T.S. (see List of Reagents, Bettendorf's Test for Arsenic) be added, no turbidity or coloration should ensue within one hour.

Uses.—This oxide is rarely given uncombined; internally, it is the active ingredient in the official antimonial powder (*Pulvis Antimonialis*). It is used in the preparation of tartar emetic.

ANTIMONII SULPHIDUM. U. S. Antimony Sulphide.

[ANTIMONY TRISULPHIDE.]

Native Antimony Sulphide, purified by fusion, and as free from arsenic as possible.

Preparation.—The crude antimony ore is purified by placing it in melting-pots, which are connected with the receiving-pots by earthenware tubes; the infusible substances remain in the melting-pots, and are separated from the fused mass, and the latter, when cold, in the form of conical masses or loaves, is called *crude antimony*.

Antimonii Sulphidum. U. S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
Steel-gray masses of a metallic lustre and a striated, crystalline fracture, forming a black or grayish-black, lustreless powder, permanent in the air. When heated, it fuses to a dark brown liquid at a temperature below red heat.	Odorless; tasteless.	Insoluble.	Insoluble.	1 part of powdered sulphide, when boiled with 10 parts of hydrochloric acid, dissolves without leaving more than a slight residue, hydrogen sulphide being evolved.

TESTS FOR IDENTITY.

If 1 Gm. of the powdered sulphide be digested and finally boiled with 10 C.c. of hydrochloric acid, it should dissolve without leaving more than 1 per cent. of residue.

This acid solution, completely deprived of hydrogen sulphide by boiling, yields, when added to water, a white precipitate, which is soluble in a solution of tartaric acid. After the separation of the precipitate by filtration, the filtrate yields an orange-red precipitate with hydrogen sulphide T.S.

Uses.—Antimony sulphide is used almost exclusively in veterinary practice as an alterative.

ANTIMONII SULPHIDUM PURIFICATUM. U.S. Purified Antimony Sulphide.

$\text{Sb}_2\text{S}_3 = 385.14.$

[PURIFIED ANTIMONY TRISULPHIDE.]

	Metric.	Old form.
Antimony Sulphide	100 Gm.	16 oz. av.
Ammonia Water	50 C.c.	8 fl. oz.
Water, a sufficient quantity.		

Reduce the Antimony Sulphide to a very fine powder. Separate the coarser particles by elutriation, and, when the finely divided Sulphide has been deposited, pour off the water, add the Ammonia Water, and macerate for five days in a well-closed vessel, agitating the mixture frequently. Then let the powder settle, pour off the Ammonia Water, and wash the residue by repeated affusion and decantation of Water. Finally, dry the product by the aid of a gentle heat.

The intention of this process is to purify the commercial sulphide from arsenous sulphide, the latter being soluble in ammonia. Hager prefers to use a solution of ammonium carbonate with the ammonia, because it is more economical, antimony sulphide being less soluble in the mixture.

Antimonii Sulphidum Purificatum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A heavy, grayish-black, lustreless powder, permanent in air. It fuses at a temperature below red heat to a dark brown liquid.	Odorless; tasteless.	Insoluble.	Insoluble.	When boiled with 10 parts of hydrochloric acid it is nearly all dissolved, hydrogen sulphide being evolved.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
The acid solution, when added to water, yields a white precipitate, which is soluble in a solution of tartaric acid. After separation of the precipitate by filtration, the filtrate gives an orange-red precipitate with hydrogen sulphide T.S.	Other Metallic Sulphides. More than traces of Arsenic.	If 2 Gm. of the salt be mixed and cautiously ignited, in a porcelain crucible, with 8 Gm. of pure sodium nitrate, and, after cooling, the fused mass be boiled with 25 C.c. of water, there will remain a residue which should be white, or nearly so, and not yellowish nor brownish. On boiling the filtrate separated from the last-mentioned residue with a slight excess of nitric acid, until no more nitrous vapors are evolved, then dissolving in it 0.1 Gm. of silver nitrate, filtering again, if necessary, and cautiously pouring a few drops of ammonia water on top, not more than a white cloud, but no red nor reddish precipitate, should appear at the line of contact of the two liquids.

Uses.—Purified antimony sulphide should be used exclusively in all the preparations into which the sulphide enters. It is not used internally to any extent.

ANTIMONIUM SULPHURATUM. U.S. Sulphurated Antimony.

[KERMES MINERAL.]

Chiefly Antimony Trisulphide [$\text{Sb}_2\text{S}_3 = 385.14$], with a very small amount of Antimony Trioxide.

	Metric.	Old form.
Purified Antimony Sulphide	100 Gm.	8 oz. av. 148 gr.
Solution of Soda	1200 C.c.	38½ fl. oz.

Distilled Water,

Diluted Sulphuric Acid, each, a sufficient quantity.

Mix the Purified Antimony Sulphide with the Solution of Soda and 3000 C.c. [old form 6 pints] of Distilled Water, and boil the mixture over a gentle fire for two hours, with frequent stirring, and occasionally adding Distilled Water so as to preserve the same volume. Strain the liquid immediately through a double muslin strainer, and drop into it, while yet hot, Diluted Sulphuric Acid so long as it produces a precipitate. Wash the precipitate with hot Distilled Water until the washings are at most but very slightly clouded by barium chloride T.S.; then dry the precipitate at a temperature not exceeding 25°C . (77°F .), and rub it to a fine powder.

Keep the product in well-stoppered bottles, protected from light.

When antimonous sulphide is boiled with solution of sodium hydrate, sodium antimonite and sodium sulph-antimonite are formed, and when sulphuric acid is added to the hot solution, these salts are decomposed, and antimonous sulphide and antimonous oxide are precipitated, whilst sodium sulphate remains in solution.

and

and

Antimonium Sulphuratum. U.S.	ODOR AND TASTE.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvent.
A reddish-brown, amorphous powder, becoming lighter in color on exposure to light. If 1 Gm. of Sulphurated Antimony be gently heated with 10 C.c. of hydrochloric acid, it should dissolve with the exception of a slight residue, which, when washed and dried, should burn, on the application of a flame, with the characteristic odor of sulphur, and should leave not more than a scanty ash.	Odorless; tasteless.	Insoluble.	Insoluble.	Soluble in hydrochloric acid with the evolution of hydrogen sulphide.

TESTS FOR IDENTITY.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>The acid solution, completely deprived of hydrogen sulphide, yields, when added to water, a white precipitate, which, after washing and drying, should weigh not less than 85 per cent. of the sulphide. The liquid filtered from this precipitate yields an orange-red precipitate with hydrogen sulphide T.S.</p> <p>When tested for arsenic, as described under Purified Antimony Sulphide, it should afford no reaction beyond the limit prescribed for the latter.</p>	Sulphate.	<p>If 1 Gm. of Sulphurated Antimony be shaken with 20 C.c. of hot water, the filtrate should be neutral to test-paper, and should not be rendered more than slightly opalescent by barium chloride T.S.</p> <p>If 1 Gm. of Sulphurated Antimony be shaken with 20 C.c. of hot water, the filtrate should be neutral to test paper, and should not be rendered more than slightly opalescent by silver nitrate T.S.</p>
	Chloride.	
	Calcium.	<p>If 1 Gm. of Sulphurated Antimony be shaken with 20 C.c. of hot water, the filtrate should be neutral to test-paper, and should not be affected by ammonium oxalate T.S.</p>

Uses.—Sulphurated antimony is alterative, emetic, and diaphoretic, in doses of one to five grains (0.06 to 0.3 Gm.).

PILULÆ ANTIMONII COMPOSITÆ. U.S. Compound Pills of Antimony.

[PLUMMER'S PILLS.]

Each pill contains about one-half grain of sulphurated antimony, one-half grain of mild mercurous chloride, and one grain of guaiac, with sufficient castor oil to form a mass. This pill is used in secondary syphilis and in various skin diseases. (See *Pilulæ*.)

PULVIS ANTIMONIALIS. U.S. Antimonial Powder.

[JAMES' POWDER.]

This powder is made from 33 Gm. of antimony oxide and 67 Gm. of precipitated calcium phosphate. It is used as a diaphoretic, in doses of three to five grains (0.19 to 0.3 Gm.). (See *Pulveres*.)

VINUM ANTIMONII. U.S. Wine of Antimony.

Made by dissolving 4 Gm. of antimony and potassium tartrate in 65 C.c. of boiling distilled water and 150 C.c. of alcohol, and adding sufficient white wine to make 1000 C.c. It is used as an addition to diaphoretic and expectorant mixtures. The dose is ten to twenty minims (0.6 to 1.2 C.c.).

Arsenic. As; 74.9.

Arsenic is found in many minerals, generally as a sulphide or an arsenide. It may be easily obtained from arsenous oxide by heating it with charcoal. Arsenic is a brilliant, crystalline element, of a steel-gray color when freshly sublimed; upon exposure to the air its surface becomes blackish and dull. Its sp. gr. is 5.73 to 5.88. It forms two combinations with oxygen, arsenous and arsenic oxides, As_2O_3 and As_2O_5 , respectively, the corresponding acid to each of which is known, and three with sulphur, namely, the disulphide, or *realgar*, As_2S_2 ; the

trisulphide, or *orpiment*, As_2S_3 , corresponding in composition to arsenous oxide; and the pentasulphide, As_2S_5 , corresponding to arsenic oxide.

Tests for Arsenic and its Salts.

1. Hydrogen sulphide, when added to an acidulated solution of arsenous acid, produces a bright yellow precipitate (orpiment). This is soluble in ammonia water and reprecipitated by acids.

2. If silver nitrate is added to a solution of arsenous acid, with a small quantity of ammonia water, a yellow precipitate (silver arsenite) is produced. This precipitate is soluble in an excess of ammonia, and also in nitric acid.

3. If cupric sulphate is added to a solution of arsenous acid, with a small quantity of ammonia water, a green precipitate (Scheele's green) is produced. This precipitate is soluble in an excess of ammonia.

4. If a liquid containing arsenic be added to a flask containing zinc and sulphuric acid, the hydrogen gas produced will upon ignition deposit a ring of metallic arsenic upon a cold surface (Marsh's test).

5. If a thin piece of bright copper plate be placed in an acidulated arsenical solution, and the latter be heated, a film of metallic arsenic will be deposited upon it (Reinsch's test).

Official Preparations of Arsenic.

Official Name.	Preparation.
Acidum Arsenosum	By roasting arsenical ores and resubliming the sublimate.
Liquor Acidi Arsenosi	10 Gm. arsenous acid, 50 C.c. diluted hydrochloric acid, distilled water to make 1000 C.c.
Liquor Potassii Arsenitis	10 Gm. arsenous acid, 20 Gm. potassium bicarbonate, 80 C.c. compound tincture of lavender, distilled water to make 1000 C.c.
Sodii Arsenas	By fusing arsenous acid with sodium nitrate and sodium carbonate.
Liquor Sodii Arsenatis	By dissolving 1 Gm. sodium arsenate in sufficient distilled water to make 100 C.c.
Arseni Iodidum	By fusing 1 part arsenic and 5 parts iodine together.
Liquor Arseni et Hydrargyri Iodidi	By dissolving 10 Gm. each of arsenic iodide and mercuric iodide in 1000 C.c. of distilled water.

Unofficial Compounds of Arsenic.

Arseni Bisulphidum, As_2S_4 . Arsenic Bisulphide.	By fusing together 5 parts arsenous acid and 3 parts sulphur, then collecting the mass.
Arseni Bromidum, AsBr_3 . Arsenic Bromide.	By diffusing arsenic in powder in a retort filled with bromine vapor, then distilling the arsenic bromide from the excess of arsenic.
Arseni Chloridum, AsCl_3 . Arsenic Chloride.	By direct combination of arsenic and chlorine.
Arseni Trisulphidum, As_2S_5 . Arsenic Trisulphide.	By fusing 5 parts arsenous acid with 4 to 5 parts sulphur, then collecting the mass.

ACIDUM ARSENIOSUM. U. S. Arsenous Acid.

As_2O_3 ; 197.68. [ARSENIC TRIOXIDE. WHITE ARSENIC.]

Preparation.—Arsenous acid, or, as it is commonly termed, arsenic, is made by roasting arsenical ores in reverberatory furnaces with long

horizontal flues : the arsenous acid collects as a solid sublimate, which is afterwards resublimed in cast-iron vessels with conical heads. Chemically, it is not regarded as an acid, but is an oxide, As_2O_3 , the true acid being formed when the oxide is dissolved in water.

Acidum Arsenosum. U. S.	ODOR, TASTE, ETC.	SOLUBILITY.		
		Water.	Alcohol.	Other Solvents.
A heavy, white solid, occurring either as an opaque powder, or in irregular masses of two varieties: the one amorphous, transparent and colorless, like glass; the other crystalline, opaque or white, resembling porcelain; frequently the same piece has an opaque outer crust enclosing the glassy variety; contact with moist air gradually changes the glassy into the opaque variety. Heated to about 218°C . (424.4°F .), it is completely volatilized without melting, and when thrown on ignited charcoal it emits an alliaceous odor. When its vapor is passed through red-hot charcoal, in an arsenic-tube, it is deoxidized, and metallic arsenic is deposited as a mirror, with a metallic lustre, on the cooler portions of the tube.	Odorless; tasteless; faintly acid reaction.	Cold, 30 to 80 parts. Boiling, 15 parts.	Cold, Sparingly. Boiling, Sparingly.	Freely by hydrochloric acid, the alkalis and their carbonates. Soluble in about 5 parts glycerin. Oil of turpentine dissolves the glassy variety.

TESTS FOR IDENTITY AND QUANTITATIVE TEST.	IMPURITIES.	TESTS FOR IMPURITIES.
<p>Silver ammonium nitrate T.S. produces in an aqueous solution of the acid a lemon-yellow precipitate, which dissolves on the addition of ammonia water, and, when this solution is heated, metallic silver is deposited (distinction from <i>arsenic acid</i>); a grass-green precipitate is produced by copper ammonium sulphate T.S., which dissolves in ammonia water, with a deep blue color; and, if the solution is acidulated with hydrochloric acid, a bright yellow one with hydrogen sulphide T.S. This latter precipitate, which is <i>arsenic trisulphide</i>, is soluble in ammonium carbonate T.S. (absence of <i>antimony</i>, <i>tin</i>, and <i>cadmium</i>).</p> <p>If 0.1 Gm. of the acid be dissolved, with 1 Gm. of sodium bicarbonate, in 20 C.c. of water, and gently heated, the solution should decolorize not less than 20 C.c. of decinormal iodine V.S. (corresponding to at least 98.5 per cent. of pure arsenic trioxide).</p>	<p>Non-volatile Matter and Arsenic Sulphide.</p> <p>Metallic Impurities, Sulphides, etc.</p>	<p>Heated in a dry test-tube of hard glass, it sublimes without leaving a residue, and the sublimate does not show at first a yellow or other color.</p> <p>If 1 part of Arsenous Acid is dissolved in 10 parts of ammonia water and gently heated, the solution should neither leave an insoluble residue nor show a yellow or other color; nor should the addition of a slight excess of hydrochloric acid produce a precipitate.</p>

Uses.—Arsenous acid is used as an alterative, in doses of one-twentieth of a grain (0.003 Gm.); externally, it is employed as an escharotic, and, mixed with various substances in the form of a paste, is often applied to cancers and ulcers. Two antidotes to arsenical poisoning are official (see page 680).

LIQUOR ACIDI ARSENOSI. U.S. Solution of Arsenous Acid.

	Metric.	Old form.
Arsenous Acid	10 Gm.	87 grains.
Diluted Hydrochloric Acid	50 C.c.	192 minims.
Distilled Water, a sufficient quantity,		
To make	1000 C.c.	8 fl. oz.

Mix the Diluted Hydrochloric Acid with 250 C.c. [old form 2 fl. oz.] of Distilled Water, add the Arsenous Acid, and boil the mixture until all the Arsenous Acid is dissolved. Filter the solution, and pass enough Distilled Water through the filter to make the product measure 1000 C.c. [old form 8 fl. oz.]. Mix thoroughly.

This is simply a solution of arsenous acid in diluted hydrochloric acid, no chemical action taking place. The official quantitative test is as follows:
